Law Agents and Land Agents.—I have, like your legal correspondent, been a reader of your Paper for some years. I have also, like him, derived a great deal of pleasure from the perusal of it, but from no part of it more so than from the remarks which have occasionally fallen from your pen upon the disadvantages of employing lawyers in the management of landed estates. Your correspondent may certainly be an exception, both in himself and his experience, but the comparisons which he makes use of far from illustrate with fairness the respective merits of law agents and land agents. I will, without going generally into the subject, touch upon two or three points upon which your correspondent founds his argument. He contends that a knowledge of the value of land is the mainspring of the existence of a country lawyer, and that he naturally acquires that knowledge from the duties which accrue to him in that capacity. Those who are practically acquainted with the occupation of land, and with the various expenses attendant upon it, and who from long experience are competent to form an opinion of the value of land for occupation, will scarcely attach much weight to the argument that a person—from the perusal of title deeds and musty parchments, and enquiries which he is compelled to make as to value, and which the present rental, whether fair or unfair, is probably near enough to determine—is likely to gain that experience which enables him to discriminate between good and bad occupation, and form an accurate judgment upon the oftentimes complication of points, which constitute the value of different and variously situated farms. I feel sure that scarcely a word is necessary to dispel the effect of any part of the argument of your correspondent, particularly as it fails of general application. The lawyers brought forward are men who care very little about litigation, and are also men of educated and enlightened minds, and consequently well fitted for the duty of placing landlord and tenant in a proper position. The land-agents, on the other hand, are for the most part ignorant and uneducated men, and have the certainly great failing (which arises from inexperience) of "go a-head" qualities. One word respecting the fairness of the comparison is unnecessary. To support an argument by otherwise than fair specimens of both classes is equally so. I will, having spun out these desultory remarks to a longer extent than I intended, leave the question in the hands of experience and common sense to decide, whether, in consulting the welfare of landlord, tenant, and the country, the manager of landed property should or should not understand it. *F. K. E., Aug.* 12.

Clover Failure.—Seeing some remarks in your Paper of the 24th ult., p. 537 *b*, on the failure of Clover, I wish to be allowed to offer some, the result of a little more than a year's practical experience in farming, combined with a little previous observation. At Lady-day, 1849, I commenced farming, and seeded down at the usual time, in the usual way, with permission of the off-going tenant, two Wheat fields with Clover and Rye-grass. I also sowed a field with Barley after Turnips, and seeded that down in the same way. The result was that neither Clover nor Rye-grass came on either of the Wheat fields, and only a very little Clover, with a poor crop of Rye-grass, on the Barley field, which had been insufficiently manured, with guano only, for Turnips, and these were not consumed on the land. I bought the seeds from neighbours who had raised them, sowed some themselves, and sold some to other neighbours, who had all good crops, thus proving that there was no fault in the seed. This year I have seeded down with Clover, &c., three fields of Wheat, two and a half being on fallow, and the remaining half being spring Wheat after Turnips, and in all of these the Clover and other seeds are well up, and promise a most abundant crop. I also sowed one of the Wheat fields of last year, which I had seeded down, but whereon the seeds had failed as before-mentioned, with Oats, having ploughed it before Christmas, and worked and treated it well in every respect, except that I did not manure it, having been told that it had been well fallowed and manured for the Wheat of 1849, the latter of which I have since had reason to believe was only partially true, and this I also seeded down again this year, the result being very little better than that of last year, so far as present appearances go; the red Clover coming up but sparingly, though plentifully sowed, and that which has come up being very weakly, and as small in the leaf, or smaller, than White Dutch. There is also a field with which I have been acquainted for upwards of 30 years, during which time one person farmed it till four or five years back, and in that time told me that he never could get a good crop of red Clover on it, and at length actually gave up trying to do so, but worked it very hard, keeping it under plough a good deal. This field is now beautifully covered with red Clover and other seeds in the hands of the new tenant, who has manured it well. The conclusion which I draw from the foregoing facts is, that it may probably be found in most cases, if fairly investigated, that the failure of Clover arises more generally from want of sufficiently manuring the land on which it is sown than from any other cause; and by giving a good top-dressing to the field in my occupation last alluded to, I do not despair even yet of obtaining a fair crop of it on that field also. Some of your readers may perhaps be disposed to criticise my course of farming, but to this I have been driven by the state in which I took the farm, and I do not think that this has much, if anything, to do with the partial failure of the Clover sown with the Oats, as it must be borne in mind that last year in every instance it failed with the Wheat, and was all but a total failure with the Barley; whilst this year it has succeeded well in every instance, excepting only this one field. How far it will "stick" remains to be proved. Lime is commonly said to be an aid to this, as also to stiffening straw and brightening the sample of Wheat, and if so, is I fear too much undervalued in modern farming; but as I have no experience on this point as yet, I only venture to state this as a general remark of divers persons who in practice seem to disbelieve their own assertion. *No longer a mere Looker-on.*

Reaping Wheat.—It may afford some gratification to the correspondent who addressed you on this subject

last week, to know that a machine for cutting the ears from the standing Wheat, leaving the straw to be gathered at leisure, has just been invented by a gentleman residing in Somersetshire, and that steps are being taken to bring it before the agricultural community. As the machine is constructed upon a well-established principle, and can be made for a small sum, there is every reason to hope that it will be of great utility. *A Reader.*

Reaping Machine.—Having observed in your Number (for August 24), the communication of a correspondent on a new mode of harvesting grain, I can inform you that in the neighbourhood of Dunbar, East Lothian, his suggestion has been carried out in a partial degree by the influence of the wind. The violent storms on Sunday the 18th, and Monday the 19th, broke off the heads of the Barley in several fields; luckily, however, there was a considerable quantity of Barley cut, and in some places there was not such a thing to be seen as the heads, except lying on the ground. On one farm in this part several children have been employed in picking them up, and it is probable that there may be several quarters of good grain saved from total loss by this means. *P. E. N.*—Observing in your Paper a wish expressed that some plan could be invented for taking off the ears of Wheat while standing in the field, I venture to send you a sketch of a very simple instrument I saw many years ago, in very common use in the United States of America for taking off the heads of Clover. It consists of nothing more than the body of a wheelbarrow, on an axletree, with two handles behind, so set that the body of the machine can be moved circularly on the axletree, and a horse attached to it by a chain and swingle tree on one side. The front board of the wheelbarrow is made slanting, and cut into teeth like a comb, shod with iron, or perhaps made of iron, and set very close at the angular point. The operation is the most simple possible. A man lays hold of the handles behind, and while the horse pulls the machine he moves the body of the barrow upon the wheels, circularly, upwards and downwards, humouring the growth of the Clover as he goes along; the heads of the Clover are all caught between the combs of the tool, and falling to pieces are thrown back into the body of the wheelbarrow, cut entirely to pieces, and in that country, where an idea prevails that sowing the husk with the Clover is better than threshing it out (I believe), it is sown in the state in which the tool takes it off; at all events each head falls into the most minute morsels. Why may not something of this sort be applied to Wheat? *Z. X. Y.*

The Study of Chemistry.—The expense of apparatus necessary in the study of chemistry might be taken from the shoulders of individual farmers by subscription, and the yearly expenses should be borne by an annual payment by each member of a class engaged in the study, who should be entitled to the use of the apparatus, and the services of the schoolmaster might be remunerated by the payment of a small sum each time his assistance was required. The farmer would reap the benefit of such an arrangement in many ways. His knowledge of chemistry would prevent the system of fraud pursued by dishonest tradesmen. From the experience I have had, I am quite confident that it will be a long while before the state of education will allow of people protecting themselves, consequently, some such plan is requisite. It will, of course, admit of great extension; the apparatus should be kept at the school, and the sons of farmers and others might meet there to their mutual benefit. If a library could be added so much the better. A series of lectures might be given in the winter season with advantage. *J. Stollard, Ipstones, Staffordshire.*

Calendar of Operations.

SEPTEMBER.

Lammermuir Sheep Farm.—Harvest operations are progressing rapidly, and under the most favourable circumstances. A very considerable proportion of the grain crop in our hill district has been cut, and in the course of a few days this will be carted and out of danger. The winds of the 19th ult. have done serious damage to the grain crop, especially in the lower districts, where much of it was dead ripe, and all of it near maturity. In general the quantity shaken amounts to the seed, and in many cases to much more. We commenced our harvest on the 26th by mowing Oats, but as yet have made very little progress, the fine weather having obliged us to keep all our hands working amongst the meadow hay, which the recent gales had scattered in every direction. Having now got this crop into something like a state of safety, we will now keep working at the corn, one-half of which is now quite ripe. With the exception of a few small Cheviots, all our lambs are now sold, and most of them off the farm. This leaves our shepherds some leisure, which is employed in manufacturing a supply of coarse meadow hay, sufficient to keep their cows for six or seven months. This is cut and prepared by the servant, and driven home by the master. Towards the latter end of this month the draft ewes will be prepared for sale. In the meantime harvest work, and distributing the meadow hay over the farm, in well sheltered places, where it can be available for sheep during snow-storms, will keep us fully occupied. *A Lammermuir Farmer.*

Notices to Correspondents.

Bad Butter: *Manxman.* The digestive organs are probably out of order. We would recommend a saline purgative—½ lb. of sulphate of magnesia, 1 oz. of nitrate of potash, dissolved in warm water or gruel, and repeated in smaller doses in a few days, if required. It may be well to put a little nitrate of potash in the milk—half a teaspoonful in a pail of 3 or 4 gallons of milk. *W. C. S.*

Cochin China Fowl: *A B.* You will find Mr. Baker's advertisement in the columns of to-day.

Kilns: *Enquirer.* The best form of kiln is the circular, tapering to the bottom, nearly in the form of the small end of an egg; indeed, there is no better form for kiln than that of an egg-shell from which the broad end has been cut, as is commonly done in eating. It is generally convenient to have two apertures at the bottom. The limestone, properly broken, and the coal, should be placed in alternate thin layers, usually in the proportion of three of the former to one of the latter; but limestones vary much in the quantity of coal required. The coal should not be placed nearer the lining of the kiln than 9 inches, so as to avoid burning the fire bricks. Where there is a constant sale, the proper plan is to keep the kiln always at work by drawing out small portions of the lime when sufficiently calcined, and adding fresh stone and coal at top. "Enquirer" should examine the best kilns near him. *J. G.*

Lime: *Constant Reader.* You had better lime *now*, and dress with guano in spring.—The peat is to be only charred. You must dig a hole, light a good fire in the bottom of it, pile on dry peat, and cover with wet peat to keep out the air; and when the fire is coming through, quench it with water.

Muzzle: *X Y Z.* Can a muzzle be so made as to prevent a calf from sucking its mother? I have had one which, though it had very sharp spikes, proved ineffectual; and is there such a thing as a Guernsey halter for tethering cows—a practice followed in Jersey and Guernsey; and where are they to be purchased in London?

Parsnips: *A M.* Do you propose to plant out roots for seed? In that case set them in 2 feet apart every way, in land not too rich, burying them up to the crown. If it be for roots, you need not sow till January or February. The Jersey Cow Parsnip is the best for cattle, if that is your object. Sow, shallow, 5 lbs. of seed per acre in rows 18 inches apart. If you have not farm-yard manure enough, sow 3 or 4 cwt. of guano broadcast.

Summer Crops: *Anon.* A succession of summer crops for cattle food, to come in at April and continue till November, will be Mangold Wurzel, to last you through June and July; Rye, through April and May; early Cabbages, through June, July, and August; winter Vetches, through May, June, and July; spring Vetches, through August, September, and October; Lucerne, through June, July, August, and September; early sown Rape, through August, September, and October; early Turnips through September, October, and November.

Superphosphate: *Ireland.* Your inquiry has been forwarded.

Swedes: *Hill-side.* They are suffering from the attacks of wire-worm. There is no help for you that we know of. You might plough the field up, if the crop is very bad, and sow White Mustard.

To Recover a Worn-out Farm: *A B* says, "My farm, consisting of three parts arable and two pasture, is upon the estuary of Milford Haven, where there is an abundance of sea-weed thrown up by the sea daily, and abundance of slime at low water; and lime at 4*s.* 6*d.* a ton on the next farm. The soil is dry and poor, and averaging a sufficient depth; and the subsoil, or next stratum, is a mixture of stones and earth so loose that after the heaviest rain the ground is dry immediately. With artificial manure (guano), which is expensive, I have an excellent field of Turnips, and with Seaweed an excellent field of Potatoes; but if any of your experienced correspondents will favour me with his advice upon the best mode of proceeding to recover a long neglected land, he will oblige. I have pared and burned about 20 acres this year; but these fields are overrun with Fern, which finds its nutriment many feet deep." [You must force good crops by guano, keep sheep and cattle on them, and so get manure enough to create and maintain fertility.]

Virginia: *W J birch.* The writer is now in that State. His meaning probably was, that the landlord would furnish *capital* on receiving half the *profit*.

Wheat: *Triticum.* The specimen sent is a very good Wheat—thin skinned in the berry, and well grown in the ear. We do not know it.

Markets.

COVENT GARDEN, Sept. 7.

Vegetables are abundantly supplied. Hothouse Grapes and Pine-apples are plentiful; Peaches and Nectarines from the open walls tolerably abundant. Gooseberries are all but over. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent in abundance. Filberts are plentiful. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are good and cheap. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are scarcer. Cut Flowers consist of Heaths, Pelargoniums, Carnations, Picotees, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosissima, Japan Lilies, and Roses.

SMITHFIELD, Monday, Sept. 2.

We have a very large supply of Beasts, but the average quality is inferior, consequently many of the best descriptions make 3s. 8d. A considerable number of second-rate remain unsold. The number of Sheep is also large, and the demand small; trade is exceedingly heavy, especially for big Sheep. We cease to quote Lamb, as the season has closed; what few come to market only make mutton price. The supply of Calves is fully adequate to the demand; prices are with difficulty maintained. From Holland and Germany there are 974 Beasts, 4890 Sheep, and 217 Calves; and from Scotland, 200 Beasts.

Beasts, 4703; Sheep and Lambs, 32,810; Calves, 330; Pigs, 304.

Friday, Sept. 6.

We have a good supply of Beasts, but not many fresh up from our own grazing districts. Trade is dull, at Monday's prices. The number of Sheep is smaller, so also is the demand, and it is with difficulty that Monday's prices are realised for anything. Lamb is scarcely saleable. We are not so plentifully supplied with Calves as of late, and trade is rather better. From Germany and Holland there are 439 Beasts, 3100 Sheep, 271 Calves, and 14 Pigs; from Scotland, 70 Beasts; 300 from the northern and midland; and 82 Milch Cows from the home counties.

MARK LANE.

Monday, Sept. 2.—The supply of English Wheat by land carriage samples this morning from Essex, Kent, and Suffolk, was smaller and of worse quality than that of last week, consisting chiefly of the new crop; a very few of the finest samples were picked out at about last week's prices, but the great bulk remained unsold at a late hour. Although there appeared a better inquiry for the finest descriptions of foreign early in the day, little business resulted, holders being exceedingly firm in their demands, with which the millers were unwilling to comply.—Barley meets an improved inquiry, at an advance of 6d. to 1s. per qr.—Beans are unaltered in value.—We advance our quotations 1s. per qr. for English white Peas, and 1s. to 2s. per qr. upon foreign.—Oats are a fair sale, at an improvement of 6d. per qr.—The show of Mustard was considerable, and amounted to 1500 qrs.; some of the best samples were picked at about 6s. 6d. per bushel, but by far the greater portion could not be disposed of.

Friday, Sept. 6.—With the exception of Russian Oats, of which the supply is large, the arrival of all grain, English and foreign, this week have been moderate. English Wheat supports our quotations of Monday last. Barley continues in good demand.—Beans are fully as dear, and rather more money is obtained for Peas.—Oats meet a free sale at former prices.—Flour supports its late value, and meets a ready sale.

Liverpool, Friday, Aug. 30.—The supplies received into this port, coastwise and from Ireland, since Monday last are light; and with the exception of a tolerable import of foreign Wheat, the arrivals of grain and Flour from abroad are comparatively moderate. At our market this morning the Wheat trade was firm, and a fair amount of business was transacted, on terms fully equal to, and in a few cases a little over, the current rates of Tuesday. Flour becoming less plentiful, and in good demand. Barley and Malt, although not readily saleable, remained unaltered in value. Beans, upon a moderate demand, supported late prices; and Peas were held steadily at late rates. Oats and Oatmeal of all descriptions barely sustained previous prices. Indian Corn realised a further advance this morning of 6d. per qr., with rather an active sale. ——Tuesday, Sept. 3.—The imports of grain and Flour from our own coasts are still on a moderate scale, but we are again liberally supplied from abroad. We had a steady but an active market this morning. Old Wheat met a moderate retail demand, at late rates. New Oats and new Oatmeal were less plentiful, and brought full prices. Grinding Peas were 1s. per qr. dearer. Barley and Beans without change. French Flour met a good sale, at extreme prices. In Indian Corn there was little doing, but it supported Friday's advance of 3d. to 6d. per qr. Arrivals and exports into Liverpool from the 27th Aug. to 2d Sept., inclusive: Wheat, 16,840 qrs.; Barley, 1885 qrs.; Malt, 810 qrs.; Oats, 6444 qrs.; Beans, 2705 qrs.; Peas, 273 qrs.; Indian Corn, 1722 qrs.; Oatmeal, 1745 sacks and 4623 sacks and 16,726 barrels of Flour.

BOTANICAL WORKS BY PROFESSOR LINDLEY.

THE ELEMENTS OF BOTANY, Structural, Physiological, and Medical. With a Sketch of the Artificial Methods of Classification, and a Glossary of Technical Terms. Price 12*s.* cloth.

The Glossary may be had separately, price 5*s.*

This will complete the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

CONTENTS.

PART I.—Chap. 1. General Attributes—2. Of the Elementary Organs—3. Of the Epidermis and its Processes—4. Of the Compound Organs—5. Of the Root—6. Of the Stem—7. Of the Leaf-Buds—8. Of the Leaves—9. Of Food and Secretions—10. Of the Motions of Fluids—11. Of the Flower-Bud—12. Of the Inflorescence—13. Of the Floral Envelopes—14. Of the Male Organs—15. Of the Disk—16. Of the Female Organs—17. Of the Receptacle of Torus—18. Of the Ovule—19. Of Fertilisation—20. Of the Fruit—21. Of the Seed—22. Of Germination—23. Of Flowerless Plants.

PART II.—Chap. 1. Linnæan Sexual System—2. Analytical Method—3. The Manner of Studying.—Glossary.

*** The Elements of Medical and Œconomical Botany, illustrated with numerous diagrams and woodcuts, is now ready.

THE VEGETABLE KINGDOM; or the Structure, Classification, and Uses of Plants; illustrated upon the Natural System. Second Edition. 500 Illustrations. Price 30*s.* in cloth.

*** To suit the convenience of Students and others, the above Work is issued also in 12 Monthly Parts, price 2*s.* 6*d.* each.

PROFESSOR LINDLEY'S ŒCONOMICAL BOTANY.

This day is published, in one vol. 8vo, with numerous woodcuts price 14*s.*

MEDICAL AND ŒCONOMICAL BOTANY; or, An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

The first two Parts of THE ELEMENTS OF BOTANY, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12*s.*

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

Just published, in demy 8vo, price 2*s.* 6*d.*

ORCHIDACEÆ LINDENIANÆ; or, Notes upon a Collection of Orchids formed in Colombia and Cuba, by Mr. J. LINDEN. By JOHN LINDLEY, Ph. D., F.R.S. and L.S., Professor of Botany in the University of London, and in the Royal Institution of Great Britain.

SCHOOL BOTANY; or, the Rudiments of Botanical Science. New Edition. 400 Illustrations. Price 5*s.* 6*d.*

London: BRADBURY and EVANS, 11, Bouverie-street.

NEW EDITION OF

PROF. LINDLEY'S INTRODUCTION TO BOTANY

Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth,

INTRODUCTION TO BOTANY, By Professor LINDLEY, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.

EXTRACT FROM PREFACE.

In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.

The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structut of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.

To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.

Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Popular Works

PRINTED FOR

TAYLOR, WALTON, AND MABERLY,

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,

28, UPPER GOWER-STREET, AND 27, IVY LANE, PATERNOSTER ROW, LONDON.

DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready*,

A SYSTEM OF POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

COMPANION TO THE POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

A SYSTEM OF POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry an Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION,

A SYSTEM OF POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

BY GEORGE DARLEY, A.B.

WITH ENGRAVINGS.—12mo, 5*s.*, cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

Price 3*s.* 6*d.* (post free.)

THE TREE ROSE.—Practical Instructions for its Formation and Culture. Illustrated by 24 Woodcuts, Reprinted from the GARDENERS' CHRONICLE, with additions.

CONTENTS.

Annual pruning time, principle of execution, &c.
Binding up
Budding knife
Budding, time of year, day, time of day, state of the plant, care of buds
Budding upon body
Bud, insertion of, into stock
Bud, preparation of, for use
Buds, dormant and pushing
Buds, failing
Buds, securing a supply of
Caterpillars, slugs, and snails, to destroy
Causes of success
Dormant buds, theory of replanting with explained
Guards against
Labelling [wind
Loosing ligatures
March pruning
Mixture for healing wounds
Pruning for transplantation
Planting out, arrangement of trees, &c.
Pushing eye, spring treatment of dwarf shoots from
Roses, different sorts on the same stock
Roses, short list of desirable sorts for budding with a pushing eye
Sap-bud, treatment of
Shape of trees
Shoots and buds, choice of
Shoots for budding upon, and their arrangement
Shoots, keeping even, and removing thorns
Shortening wild shoots
Stocks, planting out for budding upon; the means of procuring; colour, age, height; sorts for different species of Rose; taking up, trimming roots, sending distance, shortening heads, &c. saw proper for the purpose

GRAFTING.

Aphides, to keep down
Free-growers, remarks on
Graft, binding up and finishing
Grafting, advantage of
Grafting, disadvantage of
Operation in different months
Preliminary observations
Roses, catalogue and brief description of a few sorts
Scion, preparation and insertion of
Scion, choice and arrangement of
Stock, preparation of

APPENDIX.

A selection of varieties
Comparison between building and grafting

Price 3*d.*, or 5*s.* for 25 copies for distribution amongst Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the Office of the *Gardeners' Chronicle.*

THE COTTAGERS' CALENDAR OF GARDEN OPERATIONS.

By JOSEPH PAXTON, Gardener to His Grace the Duke of Devonshire, &c. &c.

Reprinted from the GARDENER'S CHRONICLE; above 57,000 have already been sold.

Just Published, price 1*s.* 6*d.*, free by post 1*s.* 10*d.*

LABELS FOR THE HERBARIUM,

CONSISTING OF THE NAMES OF THE

Classes, Alliances, Orders, and Sub-Orders

OF

PROFESSOR LINDLEY'S VEGETABLE KINGDOM,

So printed, in large type, that they can be cut out and pasted into THE HERBARIUM.

London: J. MATTHEWS, 5, Upper Wellington-street, Strand; and may be ordered of all booksellers.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for Softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

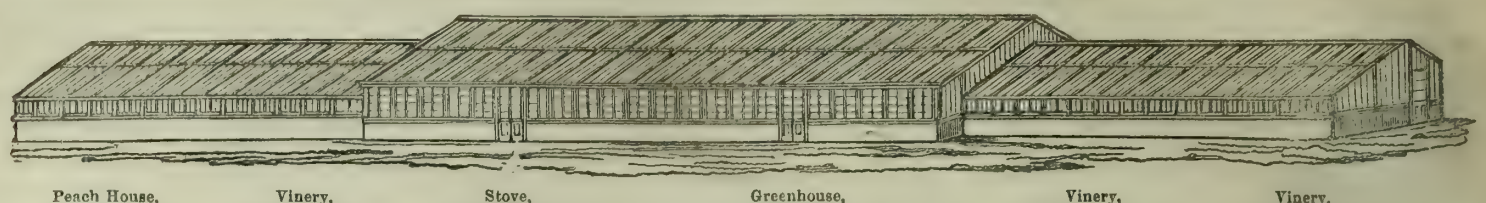
METCALFE'S ALKALINE TOOTH-POWDER will be found to be the best that has yet been produced; it contains no acids, nor anything that can injure the finest enamel; it thoroughly removes the tartar and all impurities, produces that beautiful white appearance so much to be desired, and its fragrant perfume tends to sweeten and purify the breath. M. and Co., from the many years they have been celebrated as Tooth-Brush Makers, have had opportunities (that occur to few) of testing the relative merits of those powders that have been brought before the public. They have now succeeded in procuring the receipt from which the above Powder is prepared, and confidently recommend its universal adoption. Wholesale and retail at METCALFE, BINGLEY, and Co.'s, Brush-Makers to H.R.H. Prince Albert, 2*s.* per box. Caution.—The genuine Powder will have the Royal Arms, combined with those of H.R.H. Prince Albert, on the lid of the box, and the signature and address of the firm, thus: "METCALFE, BINGLEY, and Co., 130 B, Oxford-street, London."

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free, by return for post, by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for 13 penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to Copy BRANDE'S ENAMEL Advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the Teeth! Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed Teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designated unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. Rowlands' Odonto, or Pearl Dentrifice, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*



ROWLAND'S ODONTO

Is a white powder compounded of the choicest and most *recherché* ingredients of the oriental herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Price 2*s.* 9*d.* per box.—Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

BRENTFORD.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET-GARDENERS, AND PUBLIC COMPANIES, ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to submit to an unreserved Sale, by Auction, on the premises, Brentford Nursery, Middlesex, about the second week in October (by order of the executors of the late Mr. J. Ronalds), the whole of the valuable NURSERY STOCK, riding over about 30 acres, consisting of a large and rich assortment of Standard and Dwarf Maiden, Trained and Untrained Fruit trees, of every description; Ornamental trees, Deciduous and American Shrubs; fine Evergreens, &c. Further particulars in future advertisements.

American Nursery, Leytonstone, Sept. 1850.

DALSTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

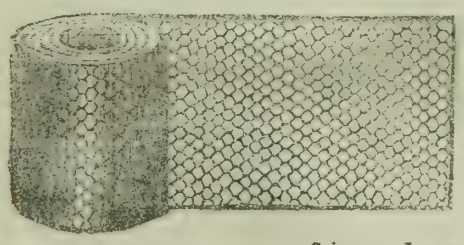
MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Smith to submit to public competition by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, September 23d, and following day, at 11 o'clock (in consequence of the Lease being nearly expired), the whole of the valuable GREENHOUSE PLANTS, comprising several thousands of choice double Camellias, from 18 inches to 10 feet, beautifully set with bloom buds; Azalea indica, Epacris, Ericas, Daphne indica, Pimelea, Corræa, Cassia corymbosa, Erythrina, Diosma, Nerium, Plumbago, Kennedya, Chorozema, Gardenias, Geraniums, Chrysanthemums, Cactus, Fuchsias, Myrtles, Acacia, Heliotropes, Aloes (sorts), Hydrangeas, China Roses, Statice, Magnolia grandiflora (ex.), Viola arborea, Calceolarias, Verbenas, Lobelias, &c.—May be viewed, and Catalogues had (6d. each, returnable to purchasers), one week prior to the sale, of the principal Seedsmen in London; on the premises; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

SPECIMEN GREENHOUSE PLANTS, &c., THE PROPERTY OF AN AMATEUR.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton (one mile from Hyde Park corner), on THURSDAY, September 19, 1850, at 1 o'clock, a large assortment of GREENHOUSE PLANTS, including some fine specimens of Ficus, Dracæna Passiflora in fine varieties, Begonia, Plumbago, Achimenes, Tecoma, Erica, Azalea, Epacris, Corræa, Bignonia; also a large plant of Rhododendron Altaclarence, Nerium, Evergreens in pots, and other miscellaneous Nursery Stock. — May be viewed one day prior to the sale, and Catalogues had of the principal Seedsmen; and of the Auctioneer, Brompton Auction Ground, Fulham-road, Brompton, near London.

BROMPTON AUCTION GROUND, FULHAM ROAD, BROMPTON (one Mile from Hyde-park-corner). Established for the Sale of all Kinds of NURSERY AND FLORISTS' STOCK BY AUCTION.



D. A. RAMSAY, AUCTIONEER and VALUER, &c., begs to inform his Friends, the Trade, and others, that he has commenced receiving (for the season), NURSERY and other STOCK intended for Sale by AUCTION. Terms, &c., sent on application.

D. A. R. begs to recommend these Sales to the notice of all Persons engaged in Planting, &c., as offering unprecedented opportunities of securing, at extraordinary low prices, large or small collections of every kind of Stock.

N.B. Every accommodation provided for Buyers of Stock required to be packed for the country or the Continent.

FARM TO BE LET, ON LEASE, at Michaelmas.—THE MANOR FARM, at Lockerly, near Romsey, about 1½ mile from Dunbridge Station, containing about 200 acres of excellent Land, with a good House. A new set of Farm Buildings are about to be erected, to meet the requirements of the tenant. None need apply who are not improving farmers, or who are not possessed of sufficient capital. For further particulars apply to M. C., care of Thomas Collins, East Tytherly, Stockbridge, Hants.

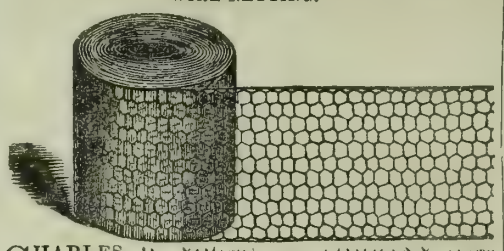
GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1½-inch " light " ...	8 "	6 "
1½-inch " strong " ...	10 "	8 "
1½-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

FARMS TO LET AT MICHAELMAS NEXT.



MR. HURLEY, Farm and Estate Agent, is instructed to let the following, amongst other desirable farms: No. 1.—TWO EXCELLENT FARMS in Herts, 26 miles from London, and close to the Great Northern Railway, consisting of 526 and 287 acres respectively, admirably adapted for Turnips, Wheat, &c., and for carrying a large flock. Rents, 18s. and 21s. per acre; superior residences and buildings. No. 2.—A first-rate Farm of 160 acres, near Windsor; good house, &c. No. 3.—A capital Farm at Enfield, of 105 acres, equally divided; superior residence and buildings. No. 4.—An excellent Farm, with gentleman residence, &c., with 100 acres of very capital land, equally divided; situate in Essex, within 4 miles of the Harlow station. No. 5.—A good Farm in Sussex of 230 acres, well drained, and adapted to the growth of Wheat and Beans, but not of heavy tillage. Rent 20s. per acre, tithes, &c., 6s. Good Premises; tenant may propose his own terms. No. 6.—A small Farm of 61 acres, in Sussex, with Farm-house and two Cottages. Rent, on lease, 50l. a year. No. 7.—A capital Farm, in Kent, of 220 acres. Rent 135l. a year, tithe 30l. Two capital Farms, in Surrey, of 400 and 170 acres. Rent and tithes low; the latter tithe free. Another, in same county, of 600 acres; rent and tithes very low. Also a good Farm at Fulmer, Bucks, of 90 acres, nearly equally divided. And, lastly, three Farms, in Kent, consisting of 155, 123, and 76 acres respectively; rents low.—Apply for terms (inclosing two stamps) to the Auctioneer, 62, Nelson-square, Blackfriars-road, London.

WANTED, A SMALL FARM, from 20 to 50 acres. Particulars to be sent to Mr. HURLEY.

WARMING.

HOT-WATER APPARATUS, with improved Boilers, requiring no brickwork, and arranged to continue in action from 12 to 16 hours without attention, adapted for Churches, Chapels, Conservatories, and every description of Building, supplied and erected on the most reasonable terms. Also the Thermanterion, an apparatus which warms without injuring the air, and recommends itself on account of its simplicity, durability, efficiency, and economy, especially adapted for Churches, Chapels, Halls, or Buildings, only used occasionally. — Apply to SPILLER and TAYLOR, Engineers, Battersea.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
82, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost ..	£3	15	0
Do. of 100 yards, 24 ins. wide	5	0	0
Do. of 100 yards, 30 ins. wide	6	5	0
Do. of 100 yards, 36 ins. wide	7	10	0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2½ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

SILVER PLATE, NEW AND SECOND-HAND.—T. COX SAVORY and Co's Pamphlet of Prices, with outlines, may be had gratis, or will be sent post free if applied for by a paid letter. The contents are the Prices, Weights, and Patterns of New and Second-hand Silver Spoons and Forks; New and Second-hand Tea and Coffee Services, Waiters, Silver-edged Plated Goods, the new Plated on White Metal Spoons and Forks, Watches, Clocks, Ladies' Gold Neck Chains, and Jewellery.—T. COX SAVORY and Co., 47, Cornhill (seven doors from Gracechurch-street), London.

BRITANNIA LIFE ASSURANCE COMPANY,
1, PRINCES-STREET, BANK, LONDON.
Empowered by Special Act of Parliament, 4th Vic., cap. 9.

STANDING COUNSEL.

The Hon. John Ashley, New-square, Lincoln's-inn.
Mr. Sergeant Murphy, M.P., Temple.

SOLICITOR.—William Bevan, Esq., Old Jewry.

BANKERS.—Messrs. Drewett and Fowler, Princes-street, Bank.

Among others, the following important advantages may be enumerated.

HALF CREDIT RATES OF PREMIUM.

Persons assured according to these rates are allowed credit (without security) for half the amount of the first seven annual premiums, paying interest thereon at the rate of 5 per cent. per annum, with the option of paying off the principal at any time, or having the amount deducted from the sum assured when the Policy becomes a claim.

Policies may thus be effected at lower rates than are generally required for the term of seven years only; whilst the holders have the same security for the payment of their claims, whenever death may happen, as if they paid double the amount of premium, which would be charged for insurances effected in the usual way.

Increasing Rates of Premium on a new and remarkable plan for securing Loans or Debts; a less immediate payment being required on the Policy for the whole term of life than in and other office.

Policies revived without the exaction of a fine, at any time within twelve months.

A Board of Directors in attendance daily at Two o'clock.

Age of the Assured admitted in the Policy.

Medical attendants remunerated in all cases for their reports.

Extract from the Half Credit Rates of Premium:

Annual Premium required for an Assurance of £100 for the whole term of Life.

Age.	Half Premium for seven years.	Whole Premium after seven years.

*** Dinner 5*s.*; punctually at 3.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.
American Nursery, Bagshot, Surrey.

HUGH LOW AND CO. have just published their GENERAL CATALOGUE OF PLANTS, which can be had free on application.—Clapton Nursery, London, Sept. 14.

EXHIBITION OF LILIUM LANCIFOLIUM, OR THE BEAUTIFUL JAPANESE LILY.

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to invite the Nobility, Gentry, and Public, to inspect his unrivalled collection of this most SPLENDID HARDY LILY, which is now in flower. For elegance of form, delicious fragrance, and freedom of flowering, it is not surpassed by any plant in cultivation. May be viewed every day (Sundays excepted). Admittance gratis.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

THE BLACK PRINCE STRAWBERRY, now sending out at 10*s.* per 100.

Also PRACTICAL INSTRUCTIONS FOR THE CULTIVATION OF THE POTATO, containing the Competition Essay for the Prize of 1000 francs offered by the Belgian Government. Also Instructions on the Management of Asparagus, Seakale, Rhubarb, Vegetable Marrow, Scarlet Runner, Strawberry, Melon, and Cucumber; Chicory and Lamb Lettuce as Salads; the Lisianthus Russellianus, and the Tree Mignonette. The Destruction of Woodlice and Green-fly; and Peat Charcoal as a Manure. By JAMES CUTHILL, Horticulturist, Camberwell, London.—Printed for the Author, and sold by him only. Price 2*s.*; or, by post, 2*s.* 4*d.*

ULMUS MONTANA, var. PENDULA FOLIIS VARIEGATIS—the Weeping Silver-striped Wych, or Scotch Elm.

MESSRS. PONTEY beg to inform the Trade and the Public that they intend sending out the above splendid Tree this autumn. It is equally robust and pendulous in its habit with the common Weeping Elm, and its leaf is distinctly striped or margined with silver. It is remarkable for its constancy in variegation, seldom or ever producing an entire green leaf. Several eminent people in the Trade have this summer seen the Stock of Plants, and pronounce it one of the greatest novelties in its line that for a long period has been introduced. The Plants are worked on stems from 3 to 6 feet high. One year worked, 10*s.* 6*d.*; two years, 15*s.*; and three years, 21*s.* each.

Messrs. PONTEY have also on Sale an extensive Collection of Ornamental Trees and Shrubs, catalogues of which can be had on application.—N.B. Remittances or references will be required from unknown correspondents.
Nursery, Kirkheaton, near Huddersfield, Yorkshire, Sept. 14

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s.* per 100.

Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s.* 6*d.* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 20*s.* per 100.—Manor Farm, Deptford.

BECK'S SEEDLING PELARGONIUMS.—No more remittances can be received for ROSA or SILK MERCER, as all the present stock is engaged.

Catalogues may be had on application to J. DONSON, enclosing a stamp.—Worton Cottage, Isleworth, Sept. 14.

KITLEY'S GOLIAH STRAWBERRY.

ROBERT WHIBLEY has now ready fine plants at a very reduced price for cash, viz., 2*s.* per doz., or 10*s.* per 100. Also, Select CHRYSANTHEMUMS, from his well-known collection, from 6*s.* per dozen. Lists can be had.
Nursery, Kennington, London.

NEW PLANTS AT REDUCED PRICES.—A List of GERANIUMS, FUCHSIAS, VERBENAS, PETUNIAS, CHRYSANTHEMUMS, and other Plants, at very reduced prices, is now ready, and will be sent on application, prepaid. The following selections now sending out.

FUCHSIAS.—Story's, Mayle's, Smith's, and Rumley's, new varieties of 1850, 12 for 20*s.*; or 20 for 30*s.*

VERBENAS.—Smith's, Barker's, Chauviere's, and other new varieties of 1850, 12 for 12*s.*; or 20 for 18*s.*

PETUNIAS.—12 new varieties of 1850 for 15*s.*

NEW CHRYSANTHEMUMS.—12 best new varieties of last season, fine plants, well established in 5-inch pots, for flowering this autumn, 15*s.*

60 very fine varieties, including the above				£2	0 0
40	ditto	ditto	ditto	1	10 0
25	ditto	17*s.* 6*d.*	12 superb varieties	0	9 0

All well established in 48-size pots.

Catalogues sent pre-paid on receipt of four postage stamps. Goods delivered free to London.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

BULBOUS FLOWER ROOTS CHEAP.
Carriage free, as see below.

The best sorts of fresh imported Hyacinths, Tulips, Irises, Gladioli, Anemones, Crocuses, Ranunculus, &c., may be had at much less than the usual prices, in valuable assortments, as under.

Choice assortment for pots, or glasses		£1	0*s.* 0*d.*
Do.	do. in half the quantities	0	10 6
Do.	do. for open ground	1	0 0
Do.	do. in half the quantities	0	10 6

For particulars of the above assortments, see Messrs. SUTTON'S Priced Catalogue, just published, which may be had on application, inclosing one penny stamp, to JOHN SUTTON and SONS, Reading, Berks.

If Hyacinths only are required, Messrs. SUTTON'S best selection may be had at 10*s.* 6*d.* per dozen, with names and colours.

N.B. Parcels of not less than 10*s.* value are sent, carriage free, to any station on the Great Western, South-Western, or South-Eastern Railways, or to any office in London or Bristol.

HYACINTHS AND OTHER ROOTS.

RENDLE'S NEW PRICED CATALOGUE OF BULBOUS ROOTS

Is just published, and can be had on application, gratis. It contains a DESCRIPTIVE *List of all the best Hyacinths, Tulips, Iris, Ranunculus, Anemones, Crocus, Liliums, Gladiolus, Ixia, &c., with some excellent* CULTURAL ADVICE *as to the best method of growing them. It will be found of great service to all growers.*

The "Collections of Seeds" sent out by us having given such universal satisfaction, we have been induced to offer the following "Collections of Roots," which we are certain will please every purchaser.

For the List of Roots contained in the Collections, see our new Book Catalogue.

COLLECTIONS OF BULBS.	£	*s.*	*d.*
No. 1 Collection, all the most approved sorts	3	0	0
No. 2 Collection, containing smaller quantities	2	0	0
No. 3 Collection, for a small Garden	1	0	0

For details of Collections, see Catalogue.

100 Hyacinths in 100 very fine sorts.	Purchaser's selection		3	0 0
100 Hyacinths in 50 fine sorts.	Purchaser's selection		2	10 0
50 Hyacinths in 50 superior sorts	ditto		1	10 0
50 Hyacinths in 25 superior sorts	ditto		1	5 0
24 Hyacinths in 12 superior varieties	ditto		0	12 0
12 Hyacinths in 12 superior varieties	ditto		0	6 0

Where the selection of Hyacinths is left to W. E. R. and Co., they request to be informed whether they are intended for water, pots, or the open ground; also whether single or double Hyacinths are preferred. When the choice is left to them they generally send about two-thirds double, and one-third single, which gives a greater variety. Purchasers may rely upon really good sorts being selected when the choice is left to ourselves, and we will guarantee to give them satisfaction.

For Catalogues, and further information, apply to
WILLIAM E. RENDLE AND CO.,
Seed Merchants, Plymouth.

N.B. Our Hyacinths and other roots have just arrived from Holland in excellent condition.

SEEDS FOR PRESENT SOWING.

JOHN CATTELL has new seeds of the undernamed, now ready to send out in packets (postage free), at the prices annexed.

CALCEOLARIA, fine impregnated, warranted to give a good variety of sorts, with directions for their culture, 2*s.* 6*d.*

GERANIUM, from new kinds, sent out last year, of florist and fancy varieties, separate, or half of each, at the purchaser's option, 18 seeds, 2*s.* 6*d.*

GERANIUM, from scented sorts, 6*d.*

New spotted NEMOPHILA MACULATA, 6*d.* Old sorts, ditto, 3*d.* SCHIZANTHUS RETUSUS, 6*d.*

RHODANTHE MANGLESII, 1*s.*

Bulbs of Tropæolum brachyceras and tricolorum grandiflorum, worth the attention of the trade. Remittances to accompany orders from unknown correspondents.
Westerham, Kent.

E. FOSTER, ESQ.'S, NEW PELARGONIUMS.

WM. BRAGG is authorised by EDMUND FOSTER, Esq., of Clewer Manor, to send out his new and choice varieties for 1850, Catalogues of which can be had on application. The Rev. Mr. ROUSE has likewise favoured W. B. with the stock of his superb Pelargonium "ALIBI." Other good and approved sorts; for description and price, see Catalogue, which contains lists of Chater's and other new and superb Hollyhocks, Pansies, Pinks, Picotees, Carnations, Roses, Chrysanthemums, &c.; ground and pot roots of show and fancy Dahlias.—Star Nursery, Slough, Bucks.

NEW CAMELLIAS, &c.

YOUELL AND CO., possessing an extensive Stock of all the new and very best varieties of the above, in beautiful healthy plants, well furnished with flower-buds, beg to offer them at 30*s.* per dozen, package included. Catalogues can be had on application.

YOUELL and CO. also beg to call attention to the following:

ERICAS, of the best autumn, winter, and spring-flowering kinds, 6*s.* to 9*s.* per dozen.

EPACRIS, ditto ditto, 9*s.* to 12*s.* per dozen.

APHELEXIS humilis, macrantha purpurea, speciosum, superbum, and other fine sorts, 9*s.* per dozen.

STATICE MACROPHYLLA, a beautiful Conservatory or Greenhouse Plant, 3*s* 6*d.* each.

MITRARIA COCCINEA, a splendid hardy shrub, with large scarlet flowers, fine bushy plants, 18*s.* per dozen.

FUCHSIAS, all the new and best varieties of 1850, 18*s.* per dozen.

VERBENAS, ditto ditto, 1850, 12*s.* per dozen.

CORRÆA speciosa major, Cooperii, bicolor, &c., in fine bushy plants, for winter flowering, 12*s.* per dozen.

PINKS, all the finest first-class show varieties, comprising such as have been exhibited in all the winning stands at the past metropolitan exhibitions, 12*s.* and 18*s.* per dozen pairs, and can be sent post free (September the best month for planting).

HYACINTHS, a superb collection of all the best kinds, known, for glasses or pot culture, at 9*s.*, 12*s.*, and 18*s.* per doz.

Catalogues can be had on application. Strong plants of their new Chrysanthemums for autumn flowering may still be had, for particulars of which see their Advertisement of Aug. 31. They also continue sending out packets of their fine Anemone Seed.—Royal Nursery, Great Yarmouth, Sept. 14.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Sept. 14.

NEW AND CHOICE GERANIUMS,
AT VERY LOW PRICES.
PLANTS WILL BE READY ABOUT THE MIDDLE OF OCTOBER.

WILLIAM E. RENDLE AND CO., Plymouth, have this season a very large stock of the following GERANIUMS, and are enabled to offer them at the
FOLLOWING LOW PRICES.

Purchaser's Selection of Twelve from the following List for Forty Shillings; or without the first three for Thirty Shillings.

Star, Ariel, Blanche, Negress, Cracker, Cassandra, Sundown, Symmetry, Gustavus, Gulielma, Grandiflora, Foster's Victory, Clown, Singularity, Refulgens, Cruenta, Princess, Junii, Rosamond, Harlequin, Emilie, Centurion, and Brilliant.

SCARLETS.—Commander in Chief, Excellence, and Queen of Summer.

FANCY GERANIUMS.

Purchaser's Selection of Twelve from the following List for Twenty-five shillings, or Twenty for Thirty-five shillings.

Alboni (Henderson's), Anais, Bouquet tout fait, Beauty of Winchester, Champion of Devon, Fair Emily, Fairy Queen, Jehu, Jehu improved, Ibrahim Pacha, Jenny Lind, Lady Rivers, Lemon-scented, La belle Africaine, Lady Plymouth, Lady Scarborough, Madame Grisi, Mazeppa, Superb, Madame Celeste, Minerva, Modesta, Magnifica Nosegay, Pheasant's foot, Prince of Orange, Picturata, Queen Victoria, Quercifolium coccineum, Radula, Rosa odorata, Sidonia, Statiaskii, Unique, and Zelia.

Purchaser's Selection of Twenty from the following List for Twenty shillings.

ARNOLD'S VIRGIN QUEEN (the best white known), Star of the West, Jenny Lind, Hoyle's Crusader, Orion, Marc Antony, Mary Queen of Scots, Rosy Circle, Nourmahal, Margaret, Mount Etna, Desdemona, Hebe's Lip, Aurora, Pluto, Champion, Pearl, Forget-me-not, Sunrise, Isabella, Duke of Cornwall, Conflagration, Black Prince, Mercury, Lady Ebrington, Scarlet Defiance, Rosa Mundi, Distinctus, Admiration, Mustee, and Flora's Flag.

Descriptions of most of the above-named Geraniums will be found in our NEW BOOK CATALOGUE OF PLANTS, which can be had on application for one penny postage stamp.

*** FIRST ORDER WILL SECURE BEST SELECTION.

All Orders above 2l. will be delivered free of carriage to any station on the Great Western, Bristol and Exeter, and South Devon Railways.

Railway and Steam communication from this port to all parts of Great Britian and Ireland.

WILLIAM E. RENDLE AND CO.,
NURSERYMEN, PLYMOUTH.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse, and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET-WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

TREES, SHRUBS, ROSES, VERBENAS, &c., FOR THE MILLION.

DAVID FERGUSON, LANDSCAPE GARDENER, CONTRACTOR, PLANTER, &c., offers common Laurels at 1*l.* to 5*l.* per 1000; if 100,000 are taken 10,000 will be added. Good standard Roses, 3 to 6 feet, 5*l.* per 100, and 40*l.* per 1000. Berberis aquifolium, fine, 1*l.* to 3*l.* per 1000. Evergreen Privet, strong, 1*l.* to 1*l.* 5*s.* per 1000. Cotoneaster microphylla, for hedges, &c., fine, 10*s.* per 100, and 4*l.* per 1000. Also large quantities of the following at low prices:—Fine specimen Cedrus Deodara and Pinus excelsa, 4 to 6 feet in height, in pots; fine specimen Arbor-vitæ, Aucuba japonica, Yews, Box, Phillyreas, red Cedars, Araucarias; Scotch, Silver, and Spruce Firs; Larch, Oak, Elm, Ash, Lime, Hornbeam, Hazel, double pink and scarlet Thorns, fine maiden Peaches and Nectarines, worked from trees in the houses on the spot; some of the fruit was exhibited at Regent-street, and received a Banksian Medal, this season, though very inferior to what D. F. has sent to his fruiterer at different times this season, which can be proved; with large quantities of other Fruit Trees. Also first-rate Verbenas, Petunias, Calceolarias, Geraniums, Fuchsias, Anagallis, Salvias, Cupheas, &c., for bedding out, at 1*s.* 6*d.* per dozen, if 5 to 20 dozen are taken; 1*s.* 3*d.* if 20 to 50 dozen are taken; above 50 dozen, 1*d.* each; and if 100 dozen are taken, 5 dozen will be added. Carriage free to London, Birmingham, Leamington, Peterborough, Banbury, Bedford, and all intermediate stations on the North-Western Railway.

Lists marked for selection at the above prices sent free on application; but to those not already in possession of a collection, D. F. advises parties to state the colour and quantity they want, and leave the selection to him; and to those that have no convenience for wintering plants, they will find it advantageous to give their annual orders in August and September for the following spring, as they, on taking five dozen and upwards, will have the choice not only of those marked in the list, but any other bedding out plant, if possible to procure, at equally low prices.

Letters directed Buckingham, in place of Aylesbury, reach D. F. one day sooner, where all Post-office orders are requested to be made payable.

FOREIGN BULBOUS ROOTS.

WM. HAMILTON, SEEDSMAN, &c., 156, Cheapside, London, begs to state that his Priced Catalogue of the above is now ready, and may be had (gratis) on application.

HYACINTHS in colours, named, for pots or glasses, 6*s.*, 9*s.*, and 12*s.* per dozen; in mixtures, 3*s.* per dozen. MIXED DUTCH CROCUS, 1*s* 6*d.* per 100. TULIPS for early forcing, 1*s.* per dozen. SNOWDROPS, 2*s.* 6*d.* per 100. NARCISSUS, 4*d.* to 6*d.* each. GLADIOLUS, IXIAS, IRIS, RANUNCULUS, ANEMONES, and a large assortment of other Roots, the prices of which will be found in his Catalogue.

W. H.'s Improved Supporter for Hyacinths, &c., 6*d.* each.

Address—156, Cheapside, London.

N.B. All prepaid orders exceeding 3*l.* sent carriage free.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, engages to supply the Public with the NATURAL GRASSES AND TREFOILS, in mixtures suited to the description of soil which may be named, at 1*l.* per acre, allowing 3 bushels. The Seeds to be delivered on the railway. Mixtures for Lawns and old Pastures at an equal reduction. These Seeds are gathered by a gentleman, who, having made them his study from boyhood, now offers the result of his labour for the good of the landed interest, who are so suddenly and unequally taxed.

A reference is required from unknown correspondents.

THOM'S SEEDLING STRAWBERRY.

ROBERT THOM is now sending out plants of the above STRAWBERRY, which has been received by the public with the utmost favour. In addition to the flattering notices which have already been quoted from the provincial press, the attention of the gardening public is invited to the following extract from the "North British Agriculturist, and Journal of Horticulture:"

"THOM'S SEEDLING STRAWBERRY.—[The following has been received from a gentleman who is an excellent judge, and one on whose opinion every confidence may be placed. We have ordered a supply of plants for our own use.—HORT. ED.]—There are many good Strawberries, but I think this is one of the best. It has three excellent qualities—figure, flavour, and productiveness. It seems a hybrid between the old Roseberry and Myatt's Seedling, having all the rich flavour of the former, and the bold habit of the latter. The fruit is cone-shaped, of a deep scarlet colour, with pink flesh; and, as a bearer, it is unparalleled. A small plot of 7½ falls produced a quantity which, sold at 6*d.* the Scotch pint, would have yielded at the rate of 160*l.* per acre. This is the sort of thing for the cottage garden. A bed 6 feet by 4, would produce enough for a man, his wife, and half-a-dozen children, and some to spare for a neighbour, who continued to grow the old unproductive kind. I do not mean this as a grower's puff, for I have seen and tasted the plant, and can safely say that I never saw or tasted anything more luxuriant and luscious, and my remark was, that a plant in a pot would keep a man in fruit for a season. But it does not thrive in a pot, and it will not force. So if any try, on my recommendation, they must give it fair play, and allow it space to exhibit all its virtues."

Price 1*l.* 1*s.* per 100 plants; 25 plants sent, post free, for 7*s.* 6*d.*—Cornhill Gardens, Aberdeen.

FIRST CLASS SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER.—For a description of this valuable flower, see the *Gardeners' Chronicle* of Saturday, Sept. 7. It is a sterling flower, and will be sure to give the greatest satisfaction. Price 20*s.* each. One over on every three to the trade.

Apply to WILLIAM E. RENDLE and Co.,
Nurserymen, Plymouth.

NEW HYACINTH SUPPORT.—HOOPER AND CO., CENTRE AVENUE, COVENT GARDEN MARKET, invite the attention of the Flower-growing Public to their new and perfect

SUPPORT FOR HYACINTHS IN GLASSES.

Its excellence consists in its being neat in appearance, easily applied, keeping the bloom erect almost without being visible, and suited to every size and shape of Hyacinth Glass.

May be obtained of the principal Seedsmen and Florists.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Piertable tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25*s.* upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts; Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by JAMES PHILLIPS and Co. (the sole agents), 116, Bishopsgate-street Without, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, FRAMES, &c.

JAMES PHILLIPS AND Co. are supplying SHEET GLASS, 16 ounces to the foot, in boxes of 100 feet each, at the following prices for each:

Sizes. Inches.			Inches.			Per foot.	Per 100 feet.
	Under	6	by	4	at	1½*d.* is	£0 12 6
From 6	„	4	„	7	„	5 „ 2*d.* „	0 16 6
7	„	5	„	8	„	6 „ 2½*d.* „	0 18 6
8	„	6	„	10	„	8 „ 2½*d.* „	1 0 6
10	„	8	„	12	„	9 „ 2¾*d.* „	1 2 11

Larger sizes, not exceeding 40 inches long.

16 oz. from 3*d.* to 3½*d.* per square foot, according to size.
21 oz. „ 3½*d.* 5*d.* „ „
26 oz. „ 3½*d.* 7½*d.* „ „

Packed in Crates of about 250 feet each, and in sizes of about 40 in. by 30, 2½*d.* per foot.

HARTLEY'S PATENT ROUGH PLATE, packed in boxes of 50 feet each:

6 by 4 and 6½ by 4½ ... 10*s.* 6*d.* | 7 by 5 and 7½ by 5½ .... 12*s.* 0*d.*
8 by 6 „ 8½ by 6½ ... 13 6 | 9 by 7 „ 10 by 8 ... 15 0

Well worth the attention of Nurserymen and Market Gardeners.

GLASS TILES AND SLATES made to any size or pattern.

HALLIMAN'S REGISTERED FRUIT PROTECTORS, from 6*d.* to 1*s.* each.

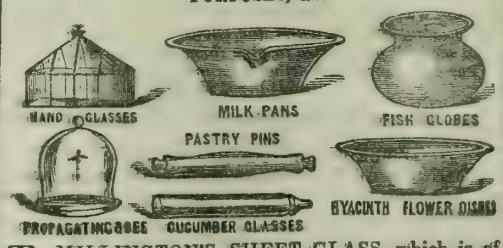
MILK PANS, from 2*s.* to 6*s.* each.

PROPAGATING AND BEE GLASSES, from 2*d.* each.

WASP TRAPS, 3*s.* 6*d.* per dozen.

LACTOMETERS, for trying the quality of Milk, 7*s.* 6*d.* each.

STANDS, for Pianofortes, 1*s.* each.



Glass Shades for Ornaments. Parian Marble. Wax and Alabaster Ornaments. Lamp Shades and Glasses. Patent and British Plate. Ornamental and Stained Glass; and every article in the Trade.

JAMES PHILLIPS AND Co., 116, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ½ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

GEORGE JACKMAN, NURSERYMAN, Woking, Surrey, 1½ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

HOLLYHOCKS.

H. LANE AND SON, Great Berkhampstead, Herts, have about 30 varieties of fine DOUBLE HOLLYHOCKS, without names, which can be depended upon as splendid sorts, at 6*s.* per dozen. They will be ready the end of September, and orders sent out in rotation as received.

A LIST OF NEWLY INTRODUCED PLANTS NOW OFFERED FOR THE FIRST TIME BY JAMES VEITCH AND SON, EXETER:

Escallonia macrantha, 21*s.* each; one over to the Trade on three.

Ixora salicifolia, 21*s.* each; ditto.
Dipladenia urophylla, 21*s.* each; ditto.
Hoya coriacea, 10*s.* 6*d.* each; ditto.
Dipteracanthus spectabilis, 10*s.* 6*d.* each; ditto.
Oxalis elegans, or Oxalis elegans major, 5*s.* each, or three for 10*s.* 6*d.* of either.
Calceolaria grandis, 5*s.* each, or three for 10*s.* 6*d.*

IXORA SALICIFOLIA (TRUE), WILLOW-LEAF IXORA.

MESSRS. VEITCH AND SON are now prepared to send out strong plants of the above beautiful and distinct IXORA, received by them from Java through Mr. Thos. Lobb. It is a lovely free-blooming species, flowering in a very young state, and at the Chiswick Exhibition in July last received the first prize for new and rare plants—the Silver Gilt Medal. It is figured and described in Curtis's "Botanical Magazine" for July last.

Strong well established plants 21*s.* each; one over to the Trade on three.—Exeter, Sept. 14.

GRAPE VINES IN POTS FOR FORCING.

J. WEEKS AND CO., King's-road, Chelsea, beg to call attention to their splendid collection of Grape Vines, all struck from eyes, now two and three years old, the finest Plants that have ever been offered for Sale, consisting of 20 varieties, all of the best sorts, warranted true.

THE HAMBURGHS AND MUSCADINES being the best for early forcing in pots, this is the best time for Gardeners to have them, so as to get the eyes ripe and prominent. This Nursery is well worthy of a visit, as all modern Horticultural improvements are in full operation.

J. WEEKS and Co., King's-road, Chelsea.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 9*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 25, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. DOGAN and Co., 48, Leicester-square, London.

TO GARDENERS, &c.

GUTTA PERCHA TUBING for Watering Gardens, spreading Liquid Manure, &c., may be had joined up to any length. Waterproof Soles for Boots and Shoes. Thread for tying up Plants. Gutta Percha Canvas suitable for nailing up Trees, &c.—Manufactured by THE GUTTA PERCHA COMPANY PATENTEES, 18, Wharf-road, City-road, London.

IMPORTANT TO GENTLEMEN, FARMERS, AND GARDENERS.

TO BE DISPOSED OF, the produce of Two Acres of POTATOES, from Mr. Sangster's prepared cuttings, on Mr. Wm. Weller's Farm, near the Falstaff Inn, on the road from Gravesend to Chatham, on the 30th inst., and the three following days, while they are being taken up. They are free from disease, and first-rate quality. Those who may not be able to attend, will please to forward their orders early (as the stock is small), to Messrs. HAY, SANGSTER, and Co., Nurserymen and Seedsmen, Newington Butts, London, with Post-office orders, payable to JOHN SANGSTER, Borough, which will meet due attention.

PRICE ON THE GROUND.

York Regents ... 6*s.* per bushel, 21*s.* per sack of 3 bushels.
American Natives ... 8*s.* do. 21*s.* do. do.
Soden's Early Oxford 10*s.* do. 27*s.* do. do.

Delivered at Rochester, or the Railway Station, at 1*s.* per bushel extra, including bag and sack.

Newington Butts, London, Sept. 14.

TO FLORICULTURAL AND HORTICULTURAL SOCIETIES and Others.—The following MARQUEES, having been bought under an execution, are TO BE SOLD reasonably, as second-hand:—250 feet by 28 feet, 180 feet by 40, 150 feet by 28, 120 feet by 33, 110 feet by 30, and 26 feet by 26.—Apply to BENJAMIN EDGINGTON, Marquee, Tent, and Rick-cloth Manufacturer, 2, Duke-street, Southwark, London.

WARMING.

HOT-WATER APPARATUS, with improved Boilers, requiring no brickwork, and arranged to continue in action from 12 to 16 hours without attention, adapted for Churches, Chapels, Conservatories, and every description of Building, supplied and erected on the most reasonable terms.

Also the THERMANTERION, an apparatus which warms without injuring the air, and recommends itself on account of its simplicity, durability, efficiency, and economy, especially adapted for Churches, Chapels, Halls, or Buildings, only used occasionally. — Apply to SPILLER and TAYLER, Engineers, Battersea.

MESSRS. VEITCH AND SON'S CATALOGUES OF NEW AND RARE PLANTS, STOVE AND GREENHOUSE PLANTS, GERANIUMS, AMERICAN PLANTS, &c., &c., are now ready, and can be had, on pre-paid application, by enclosing two postage stamps.—Exeter, Sept. 7..

SCARLET GERANIUMS.

CONWAY'S PRINCESS ALICE.*—Colour, bright vermilion, with white eye, large globe truss, free bloomer, of good habit, and a very desirable variety either for pot or bedding. Strong plants 5s. each on the 1st of October.

Also ready, at the same time, strong plants of Flower of the Day, 10s. 6d.; Commander in Chief, 5s.; Princess Royal, 2s. 6d.; Queen of Summer, 2s. 6d.; Trentham Scarlet, 1s. 6d.; Queen, improved, 1s. 6d.; Excellence, 1s. 6d.; Royalist, 1s.; Punch, 1s.; Gem, 1s.; Cottage Maid, 1s.

The above selection of 12 attractive varieties may be had for 30s., basket included.

NEW PETUNIA, CAPTIVATION.* — White, with purple throat, large and well-shaped flower; a good bedding plant; 3s. 6d. each.

GERANIUM, CORONATA.*—Pink and white, profuse and perpetual bloomer, flowering very early in the greenhouse, 3s. 6d. each.

CALCEOLARIA MULTIFLORA.*—Yellow compact dwarf variety for bedding, 3s. 6d. each.

* These plants were shown at the Metropolitan Exhibitions this season, and were greatly admired.

MARY CONWAY, Earl's Court Nursery, Old Brompton.

HEDENHAM ROSARY, BUNGAY, SUFFOLK.

A DESCRIPTIVE CATALOGUE of a Selection of THE BEST HOLLYHOCKS in cultivation, by R. B. BIRCHAM, for the Autumn of 1850, and Spring of 1851.

Name.		Colour.	s.	d.
Atro-purpurea ...	Chater's...	dark purple	1	6

William Tell ...	Bircham's	dark lilac	5	0

If the Selection be left to R. B. B.

Twelve first-rate varieties of the above	£2	0	0
Twelve good ditto ditto ...	1	0	0
Twelve second-rate varieties	0	12	0
Twelve border ditto	0	6	0

Mixed sorts, 30s. per 100.

A remittance requested on delivery of plants. Post-office orders payable at Bungay, Suffolk, to ROBERT BIRCHAM.

Carriage paid to London. Plants added to compensate for carriage, and every attention paid to the packing.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 14, 1850.

MEETINGS FOR THE ENSUING WEEK.

COUNTRY SHOWS.—Monday, Sept. 16: Camberwell Amateur Dahlia, and Surrey Dahlia.—Tuesday, Sept. 17: Royal Oxfordshire Horticultural.—Wednesday, Sept. 18: York Horticultural.

To what secret causes the MORBID APPEARANCES observed among plants are to be traced, will never be ascertained till a much larger number of cases than we yet know of shall have been accurately recorded. It is only by a comparison of such instances with each other and with parts in a healthy condition, and by a consideration of the numerous modifications of them, which abound in all directions, that any sound views of their cause, progress, and cure can possibly be arrived at.

It may be questioned, indeed, whether some of the morbid conditions with which gardeners are familiar can be properly called diseases; for they are connected with no decay or unhealthy change of the tissues, and can only be looked upon as instances of disturbed, not diseased, action. Nevertheless, as everything which is at variance with the ordinary state of a plant when in undoubted health must be regarded as a symptom of the natural functions being disturbed, it seems right to class among diseases, even such affections as perhaps merely indicate exuberant vigour.

The transition from health to disease and death may occur in two opposite directions. On the one hand we may have the sources of health wasted by gradual decay, contaminated by deleterious agency, and manifested, in the first instance, by signs of mere debility; on the other hand we may witness excessive enlargement, unnatural vigour, signs of unusual exuberance also passing by degrees into decay, emaciation, and death. These fundamental distinctions may be represented by a circle, of which, as in the accompanying cut, the point A represents a perfectly sound constitution, while the point B indicates disease equally brought on by vigour and weakness.

The first is *atrophy;* the second is *hypertrophy*. To the first belong yellowness, shrivelling, shanking, blindness, canker, casting foliage, dropping fruit or flowers, and the like. To hypertrophy we must refer the green pustules on Vine leaves, unnatural emission of roots from branches, as in the Vine and Laurel, watery shoots in trees, perhaps galls, cockscomb appearances, gum, fruit-bursting, unfruitfulness from excessive production of wood, and other affections of a similar kind.

It is not pretended that all diseases are to be referred to one or the other of these two classes. On the contrary, there are some which may be regarded as a mixture of the two; and there are others which depend upon circumstances quite foreign to either atrophy or hypertrophy. Nevertheless it will be useful in practice, and in considering how to deal with a disease, to ascertain whether or not it may not be placed in one or other of the two classes. The method of dealing with it must necessarily be governed by that preliminary determination.

The case now represented is one of those examples which appear to be distinctly referable to atrophy. In the spring of the present year, JOHN CROKER, one of the young men employed in the garden of the Horticultural Society, remarked some plants of the "Favourite" Pelargonium, and another or two, attacked by a singular swelling of the stem, attended by imperfect attempts at the production of leaves. As these swellings increased they were made the subject of enquiry, and it was ascertained that they consisted in an excessive development of the cellular (or fleshy) matter of the stem, assuming on the surface a warted or tubercular appearance; that the warts were of a great variety of sizes, all tapering to a sharp point, some divided into two plano-convex parts, and a few supported by minute stunted leaves. A section of the surface of the enlargement appeared as at A. The plants thus affected were feeble in their growth, made little progress, and gradually lost their leaves. Both cuttings and old plants of the "Favourite" Pelargonium were attacked. By degrees the fleshy masses rotted off; but the plants remained unhealthy during the rest of the summer.

Here it would seem that the disease consisted in an unnatural development of cellular matter at certain spaces on the stem, owing, it may be presumed, to the leaves being unable to consume the organisable matter existing in the stem. That matter, finding no demand upon it in the usual places, gradually collected, and at last, forced onwards by the vital forces of the plant, broke through the surface in the form of imperfect leaves and buds; for we entertain no doubt that the sharp tubercles which studded the excrescences, were a mixture of rudimentary leaves, incapable of extension after being generated, and of "growing points," in like manner arrested from an insufficient supply of food. Had the plant been sound in constitution, it would either have expended its sap in the formation of true leaves, and in that case no such accumulation as here occurred could have taken place; or, if by local causes the original leaves had been so disturbed in their action, that such an accumulation of sap was effected, then the leaves and buds consequent upon it would not have remained stationary after their first appearance, and would not have dropped off, but would have lengthened into true leaves and branches, and formed themselves into monstrous but permanent excrescences.

The present condition of these plants, at the end of a summer, is this. Some of them, which have been unable to gain greater vigour, are nearly dead. Others, on the contrary, which have now made more healthy shoots, have nearly lost their warts; but evidently retain their tendency to produce them. We presume that if means had been taken to bring on very vigorous growth, the warts would have disappeared altogether. Perhaps some one of our readers may have observed how this would be.

HOW TO MISMANAGE A GARDEN.

CHAPTER VI.—Water is not an uncommon source of profit to the mismanager. It is quite astonishing, indeed, how easily this element may be made to assist in spoiling a garden.

Foolish people say that it is a part of the food by which plants exist, and that it requires to be administered with care, skill, and discretion. But your geniuses are not to be bamboozled by fine names, or what the world believes to be authority. They know better. How, indeed, can anything be fed on water? Can a man, or a horse, or a sheep? Even a goose on a common won't live on water, but must have Grass. How, then, should a plant? The opinion of the mismanager is decidedly that water is of no other use than to moisten the soil, and therefore he keeps his soil as wet as he can.

He has also his own ways of applying it. When he waters the plants in his borders, he gives them "just a sprinkle," by holding the watering-can high, and allowing the drops to dash on the ground "quite natural like." By repeating this operation once a day, he will by degrees bring his ground to a nice hard surface, so as to keep in the heat, and be easily raked. It is true that hard, hot ground is not favourable to the admission of water, but, then, it has the advantage of looking well; and besides, if water is poured on it, somewhere or other it must go, and it will be sure to find its way to the roots——if it does not find its way to the gravel walks or a neighbouring ditch.

In like manner, if plants are in pots, they should be deluged overhead, from a coarse-rosed watering-can. When you see the water running out of the hole in the bottom of the pot, you can be under no mistake that plants have had enough. It is true that a good deal of soil and other matters run out of the pot along with the water; but that is of no consequence: there is the more room in the pot for a further supply of water. It is true that little or no water remains in the pot, the ball of earth being too hard

to receive it; but that also is of no importance, because it is so easy to water it again.

Some people, on the other hand, soak their potted plants very gently, and when the ball of earth has taken all it can, they then remove it carefully from the water. But that is troublesome, takes up a great deal of time, slops a man's legs, and is merely a fancy of folks who pretend to be wiser than their neighbours.

Another method to be particularly recommended is to water trees in the open ground, by pouring down water at the foot of the stem. The man who has a genius for mismanagement knows the advantage of that. Water is to moisten roots; the biggest roots are at the foot of the stem; therefore water should be applied to the foot of the stem. It must be owned that the advantage of the practice is not apparent, unless a heavy storm of rain should fall immediately afterwards; but as the reasoning is correct the practice must be right.

It will be evident that the plans of the mismanager are far more judicious than those of the man who contrives to irrigate his beds by turning a gentle stream over them. If it were only because so much labour is saved by irrigation, such a Frenchified way ought never be be adopted. It is just as absurd as that plan of warming water in tanks artificially heated or exposed to the sun, before using it. Who would drink lukewarm flat water, if he could get it fresh and cold from a deep well; and why should a plant like it? As to warming it by hot-water pipes, that is about the silliest scheme of the modern pretenders to a knowledge of gardening. A labouring man might as soon think of washing his face and hands in warm water. Besides, plants cannot feel. If you ask our friend the genius whether he does not think that warm water would agree better than cold with a labourer in a violent perspiration, or who had been stewing all day in a hothouse, he triumphantly enquires whether a plant is a man. It may be true that tropical plants come from countries where cold water is unknown; perhaps they do; perhaps they don't. At any rate the mismanager will teach them how to bear it; and it cannot be denied that to harden plants is an object with all real gardeners.

Never have a syringe in your garden. What is the use of a syringe? It only throws water on leaves; but where is the advantage of moistening leaves? Even if plants did feed on water, they would not feed by their leaves. You might as well put a man's roast beef under his arm-pit and expect him to fatten by it. Still more repugnant to all the mismanager's ideas is the foolish habit of syringing the walls and brick paths of a greenhouse. What is the use of that? What good can it do a plant to throw water on a brick wall not within a yard of it? No, no; keep the footpaths dry and nice to walk upon; keep the walls dry too—(if you do not they are very likely to be covered with "green") and then you will make things comfortable. If you do employ a syringe be sure to use it most when Vines are in flower, and afterwards when they are in fruit; and in the greenhouse, first when the flowers are opening, and next when the wood is ripening. When they are making their growth it is of no consequence.

These rules are highly deserving attention. There can be no doubt that if they are carefully studied, and the precepts duly observed, there will be little left to desire by him who would mismanage.
Κήπουρος.

GARDENING IN HOLLAND.—No. II.

IN that quaint old town yclept Ghent there are markets for flowers, for pigeons, and for puppy dogs, all of which I duly inspected. Fruit, vegetables, herbs, as well as medicinal drugs, are all exposed for sale in this congeries of markets. Amongst fruits were some varieties of summer Pears that differed from those grown for the market at home, but possessing no merit to warrant their introduction here. Nuts and a few Filberts were exhibited, and an abundance of Plums. Of these, the Greengage and Cherry Plums were most common, the former more yellow-green than we usually grow them, and the latter prettier to look at than to taste. Not a Peach or Nectarine was shown, but Apricots from standard trees were plentiful.

It was amongst the flowers that I had hoped to find varieties that are not cultivated with us; but such is the effect of rail and steam, that there was not a single plant but was familiar, although some were of kinds that we do not usually grow in pots. For instance, there were displayed three kinds of Marigolds, a Sunflower, China Asters, Mallows, and even Hollyhocks in pots. To me the China Asters appeared the only kind worthy of pot culture. A few Gladiolus Gandavensis and Lilium lancifolium enlivened the collections, but neither so well grown as we are accustomed to see them in England. In the culture of the Lilies one thing, however, surprised me, which was, that they had contrived to produce three or four blossoms upon stems not more than 18 to 24 inches high. I was tempted at first to believe that the roots were not there, only the flower-stems; but I afterwards learned that the roots were put late into pots and plunged in the open ground, having no other covering than ashes or sand.

The nursery of Van Houtte is a short distance from the town, and as time was precious, I drove, to allow as much as possible to this far-famed collection. The ground skirts the road for a good distance, the entrance being at the extremity furthest from the town, the reason for which I could not divine. A high hedge of Hornbeam protected hundreds of Camellias and New Holland plants, and prepared me for the sight of almost a town of glass houses. On arrival I noted the little attention that had been paid to the culture of specimen trees of hardy kinds, and the utter neglect of any attempt at what we call landscape gardening—all here was hard, mechanical, and business-like. It looked a manufactory for plants, as such, indeed, it is, and something more. I took a rapid glance over the herbaceous department, which is large, and contained some plants not usually cultured with us, especially some Composites. The Alstrœmerias were nearly out of blossom; they had been grown under glass, and the lights taken off as the plants had advanced. In this manner many bulbs are grown in this establishment, and some, as the Zephyranthes alba, that I should have thought would not have required this indulgence.

I had here the opportunity of seeing beds of Gladiolus Gandavensis in full flower; they differ slightly from each other, as has been well given in Paxton's plate; but there was none of them at all comparable with G. Brenchleyensis, of which some inquiries were made in the *Gardeners' Chronicle* a few months back. G. Brenchleyensis is a far superior flower, being at once of a higher as well as more pure and transparent a colour. I had left it in blossom at home only a few days before, and could not be mistaken Both hybrids have natalensis for one parent; but the other may have been cardinalis in one instance, and florabundus in the other; but however this may be, one thing is certain, namely, that we have no border flower a rival to G. Brenchleyensis—it is peerless.

After Groom's Lilies, or even my own, I could but feel that those I saw were not particularly well grown; but then it is not made a point of here, and there is quite enough well done to allow the truth to be told without offence. In fact, as far as plants go in this establishment, the very great merit is in the hothouses.

We have here collections of Palms and tree Ferns, of herbaceous Ferns and Tillandsias, &c., of dimensions we only expect to find at botanic gardens or our own Loddiges. These are in fine health; in one house placed so thinly that the form of each was shown, whilst in another that delightful intricacy of tropical forms is produced by growing them closely together, with twining creepers and dependent Orchids. The extensive use of Lycopodium, both on the borders and in pots, gave a freshness and coolness to the whole. A Cycas revoluta, with a stem 12 feet high, and dividing into four branches, with their leaves, gave a very extraordinary character to one of the houses. The houses are generally narrow, and some of them of extreme length; the longest appeared upwards of 300 feet, and with a path so narrow that one person only could pass down at the same time; but arrangements were made to pass each other at intervals, there being side niches in which one person might stand whilst another continued his way unimpeded. This long house was entirely filled with stove plants. Nearly all the structures are low, and at their entrance you have to descend some two or three steps.

In one house I observed nothing but Gloxinias, which were admirably grown. In this family Mr. Van Houtte seems to take particular interest, for here were seedlings and crossings almost without end; and amongst them were some very beautiful new varieties. A house has just been erected for the growth of Victoria regia; it is circular, the outer walls about 5 feet, upon which rests a curbing of stone, which receives the iron sash bars—for rafters there are none; these ascending at a low angle, are united by a circular collar of iron, upon which is supported the only means of ventilation. The tank is 3½ feet high, and the young specimens appeared very happy in an atmosphere of 95° Fahr. But the most remarkable part of this establishment, and one that separates it entirely from all rivalry, is the manufacture of coke and gas for the buildings. What gas could be required for, in such quantity, at first puzzled me; but when I saw a whole range of buildings, capable of holding 150 persons at their desks, I ceased to marvel.

It is here that artists paint the flowers from nature; these are copied, for form and shadow, upon stone, and struck off upon paper; each separate outline then is passed to youths to colour, as nearly as they can to the original—the artist who formed the first design superintending them. I believe we have no such artistic workshops at any nursery in England.

I returned as highly gratified with the place as with Mr. Van Houtte's politeness, and would recommend all lovers of gardening, travelling in Belgium, to spare a few hours to its inspection. *William Masters, Exotic Nursery, Canterbury.*

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

THURSDAY, *August* 1. — SECTION D. — PROFESSOR ROYLE, M.D., made a communication *On the Herbaria of the Hon. East India Company.* He stated that the collections of plants of the Company consisted of specimens collected by himself, and Messrs. Griffith, Falconer, Harris, Stocks, and others. Of these the most extensive was that of the late Mr. Griffith, containing about 12,000 species. These were principally from Assam and Affghanistan. The other collections contained Himalayan, Cashmere, Scinde, Abyssinian, African, and Arabian plants. The duplicates in these collections had been presented to various public museums. — Professor Walker-Arnott complained that in the distribution of their plants the Hon. East India Company had not given any to individuals who were studying the botany of India, and who would make much better use of them than public institutions, where frequently there was no provision made for their preservation, and they were regarded as mere lumber. He knew institutions where this had been the case, and at the same time the only individuals who could make use of these perishing treasures could not get at them. He was glad to hear that the stores of the India House were being distributed, and would suggest that such botanists as De Candolle, Bentham, Hooker, and others who were studying particular families of plants, should not be forgotten in their distribution.—Professor Balfour expressed his thanks to the East India Company for the plants presented to the University of Edinburgh, and hoped that they would be made use of there. —Professor Royle stated that the plants had been distributed at his suggestion, and he had thought that institutions to which all had access were the most likely places in which the plants would be made generally useful and available.

Remarks on Anacharis alsinastrum, by C. C. BABINGTON, Esq. This plant, which had been recently added to the British flora, threatened to become one of our most troublesome weeds. It was first discovered about eight years ago by Dr. George Johnston, of Berwick-upon-Tweed, in a pond at Dunse Castle, near that place. It was afterwards found by Dr. Johnston in the river Whittader, and although he had for many years been in the habit of botanising in the waters of this river, he had not previously seen it. It was observed only in small quantities at first, but it was now one of the most prominent features in the vegetation of the stream. Subsequent to Dr. Johnston's observations, it was found in a canal near Leicester. At this time it was examined by Mr. Babington, and although very like to a Canadian plant, the Udora canadensis, he had named it Anacharis alsinastrum. At first no flowers had been discovered, but he had now specimens to exhibit which possessed flowers. It was evidently a dicœcious plant, and the flowers on the present plants were staminiferous, but they possessed no anthers. The plant was allied to Vallisneria, and the flowers were attached to an elongated stalk similar to those of Vallisneria. Since the announcement of the discovery of the plant, three years ago, it had been found in many of the canals and rivers of this country; and in ponds and reservoirs where it had been introduced, it had been increased in such quantities as to render it necessary to remove it. This had been the case in the Cambridge Botanic Garden. Professor Walker-Arnott stated his conviction that this plant was precisely the same as the Canadian plant Udora canadensis.

In the MECHANICAL SECTION (G.), Mr. MACPHERSON brought forward a plan for preventing water-pipes bursting with the frost, but as several expert mechanicians present expressed their conviction that the author's plan would not be more likely to succeed than that of others, we merely record the fact for the purpose of indicating the desirableness of some method which would secure the object Mr. Macpherson had in view.

FRIDAY, *Aug.* 2.—In the CHEMICAL SECTION, Mr. R. HUNT read a report on the *Present State of our Knowledge of the Chemical Action of the Solar Radiations.* After an historical introduction, the author summed up as follows:—The chemical action of the sun's rays is proved, by its influence on organic and inorganic bodies, to extend over all the luminous rays of the prismatic spectrum—and slightly beyond them at the least refrangible end, and considerably beyond them at the most refrangible extremity. Living organisms and the products of organic life appear to be influenced by light—the luminous power—as distinguished from the purely chemical or calorific powers. The vitality of plants is stimulated by light; and although many functions are performed in the absence of luminous radiations, they appear to be all quickened by its exciting powers; at the same time we have evidence to show that the chemical principle is necessary to the processes of assimilation, and consequently to the production of many of the proximate constituents of plants. The author is of opinion—though he regarded the subject as open to serious inquiry—that the process of germination and budding are essentially influenced by the chemical principle *Actinism;* that the decomposition of carbon is peculiarly due to the luminous principle; and hence that the formation of wood in plants is a function of their vitality excited by *Light;* that the development of the flower is due to a delicate balance of the forces *Actinism* and *Light*, since we find that both the luminous and chemical agencies are very active during the process, and that the ripening of fruit and the perfecting of the healthful conditions of the seed are due to a combination of the calorific and chemical forces—as evidenced in the so-called parathermic rays—many of the properties of which have been examined by Sir John Herschel and Mrs. Somerville. With regard to the action of the rays of light on inorganic bodies, the author thought the following propositions established: 1. That the maximum of chemical (actinic) phenomena was to be found where there was the least quantity of

light and heat. 2. That as the luminous power increased—either in the spectrum or in natural phenomena—the chemical (actinic) power diminished, until it came to its minimum, where light—luminous power—existed at its maximum. 3. That although the chemical influence extended to the red or heat-giving rays, its operations were materially modified, and to all appearance changed, by the combined operation of the calorific power, and that results standing in direct opposition to those obtained by the pure chemical rays were given by the chemico-calorific rays. In conclusion, the author pointed out the wide field for investigation which was opening up to the experimentalist; and he showed that, although much had been achieved by the experiments already undertaken, there yet remained a most extensive ground for inquiry, which may be considered as absolutely unbroken; chemical action, vital power, electrical phenomena, and phosphorescence were proved to be directly dependent on the solar influences; but we yet want the researches which shall satisfactorily show whether these phenomena are due to one great principle modified by the matter on which it acts, or if they result from the operation of forces combined in action, although very different in their resulting effects.

VILLA AND SUBURBAN GARDENING.

When produced in perfection, few plants are more esteemed than the Lily of the Valley, more especially when brought into bloom during winter. Its fragrance and simplicity never fail to elicit for it a tribute of esteem from the fair sex. Nevertheless, how seldom do we see it well flowered in winter in private gardens. Let us, therefore, point out how this may be obtained.

As its name implies, it is the Lily of the Valley, delighting in rich deep alluvial soil. It will not thrive under trees, where all nutriment and moisture are absorbed. It would be nearly as consistent to expect a Water Lily to grow on a rock; such situations are, however, frequently assigned to it. A spot suitable for its successful growth should be selected where the staple is light, rich, and deep, and where moisture can be conveniently applied in dry weather when the plant is making its foliage, for unless a vigorous foliage is obtained, the flowers will be partial and small. In preparing the ground for planting, a generous coating of well-decomposed manure should be given, and if vegetable manure, such as decayed leaves, can be obtained, a large portion of this may be safely applied. Let the ground be turned up at least 18 inches deep and the manure well incorporated with the soil.

The best time to form new plantations of the Lily of the Valley is during autumn, when the foliage is becoming yellow; when planted at this season, in one year they will make strong flowering plants. If the plantations are made with a view to the plants being eventually potted and forced, they should be planted in patches of two or three roots, 18 inches apart, and 2 feet between the rows. By constant attention to moving the soil amongst them, and keeping the land clear of weeds, they will form strong roots fit for forcing in a year. The patches should be taken up whole and placed in the pot without disturbing the mass of roots, or tearing them asunder, as is frequently done, which, in fact, is one cause of failure.

Plants treated as above described are almost certain to bloom freely. A mixture of light loamy soil and leaf-mould will be found suitable material to pot them in. The pots should be placed in a cold pit or frame, and if a succession of bloom is required, a portion only should be put into the forcing-pit or hothouse at a time. A temperature of 60° will be found suitable for them. The surface of the pots should be kept moist, and as soon as they begin to emerge from the soil, frequent slight syringings should be afforded them. When the plants are coming into flower, they should be gradually exposed to a lower temperature, which will be the means of keeping them longer in perfection; or if they are intended for bouquets, they will not flag so soon as when they are cut from a stove. *Pharo.*

Home Correspondence.

Roberts' Tiles.—Having given Mr. Roberts' Strawberry tiles a fair trial this season, I must say that my opinion of them is most decidedly unfavourable. In a wet, dull season, they might be useful in keeping the fruit dry, but they certainly will not answer in a fine warm summer. The tiles become so hot that they actually cook the fruit, and I was compelled to remove them last July from two or three beds, or I should have lost all the crop. I left a few on one bed, the remaining portion being covered with fresh moss, and the contrast was striking, the fruit upon the moss being far larger and finer than those upon the tiles, many of which were quite scorched. I am also convinced that the tiles absorb a large amount of moisture from the ground, and, consequently, injure the growth of the plants. *Henry Doubleday, Epping, Sept.* 9.——I have used Mr. Roberts' tiles for two years, and have given them a fair trial. In comparison with slates, sweepings of lawns, and flints, I have found the tiles to be superior to anything that I have employed for keeping the fruit clean and free from vermin. I would not, however, recommend them to cobblers, and slow-go-motives, but to practical gardeners, in whose hands they are amongst the best articles that can be introduced into a garden. *D. Johns, The Gardens, Shobrook Park, Crediton, Devon.*

Potatoes from Cuttings.—Our Potatoes from cuttings are still growing vigorously, while those planted in the usual way are diseased. Although no chemist, it is my opinion that a proper quantity of starch is wanting to bring the Potato to maturity. From 7 lbs. of Potatoes, the produce of whole sets, planted in the usual way, on the 6th April, I had 1 lb. 3¾ oz. of starch. From the same sort, raised from cuttings, put in on the 4th May, the produce was 1 lb. 13½ oz., showing a difference of 9¾ oz. I observed, when taking the first water from the pulp, that that from the former was a very much darker brown than that from the latter, which was a muddy white. I have taken up my White-blossom Kidneys, the produce of tubers from cuttings of 1849. They are all sound; I have obtained 30 bushels off 6 rods. *John Sangster, Cumberland-place, Newington Butts.*

Large Cucumbers without Seeds.—The great pains taken to produce large Cucumbers with few or no seeds, is, as far as the palate is concerned, labour thrown away. Any common Cucumber, with however many seeds, not approaching to ripeness, or bitter, is as well flavoured and more digestible than the finest looking specimen that was ever grown at 50 times the cost and trouble. *C.*

Scientific Excursionists.—In reading the report of the British Association, in one of the Edinburgh newspapers, we are informed that nearly 300, belonging to the association and other learned bodies, set out on an excursion of pleasure to the Bass Rock and the ruins of Fontallan Castle. This was all very well; but there was one thing connected with the excursion I could scarcely believe, and had to read the paragraph twice over. We are told that "they had no botanist to name the plants picked up by one or two of them, the most conspicuous being the Beta maritima, as was supposed, and even the locality of the beautiful Lanatera arborea was not discovered. The Solan geese required no description, and their exceeding tameness gave every one a full opportunity of examining their form and plumage." Had it been a company of gardeners in the first year of their apprenticeship, we have no doubt that some of them would have been able to tell whether the plant that was picked up was the Beta maritima or not; but when we bear in mind that the cream of the scientific world were not able to distinguish the difference between the Beta maritima and the Cakile maritima, or the Crambe maritima, or the Chenopodium maritimum, or any other maritima, it is high time that they were turning their attention to Dr. Lindley's "School Botany." Is it right to be able to talk about Lepidodendron and Lepidostrobus, Neuropteris and Odontopteris, Sphenopteris and Cyclopteris, Stigmaria and Sigillaria, found in the stony herbarium of Nature, before we are able to distinguish between a Sea Beet and a Sea Goosefoot in a living state on our native shores? With such a company, in such a locality, we might have expected some addition to our marine botany—some new Cladophora or Sphærococcus, looking—

> "—— as if these wonderous plants had thought
> And power to choose out places for their growth;
> As if they sought to bless the homeliest haunts,
> And clothe the rock with beauty: bidding men,
> Passing perchance in haste, to pause and think
> Of Him who made them, and look scorn no longer
> On lowlier ones, whom the Most High hath placed
> In fitting stations."

It is really surprising that so many learned men should know so little about botany, almost as little as the tame inhabitants of the Bass Rock; for some of them may say, "Meæ alæ pennas non habent." *P. Mackenzie.*

Amateur Gardening.—As I conceive the object of your Paper is not only the further improvement of the literate in gardening matters, but also the instruction of the illiterate, I think your Calendar writer would do a service to many, if he would not only instruct them in the time and manner of cultivating their crops, but would add some information as to the character of vegetables, and the state in which they are fit for use; and the manner of preparing them for the cook. It is frequently said that God sends meat, but some one else sends cooks. The same might be said of amateur gardeners. For instance, I purchased this year a select parcel of garden seeds from one of the best growers who advertises in your Paper. Amongst them were several of which I knew nothing, but having the seeds, I wished to grow them, and having grown them, I wished to eat them; but from not knowing the nature of their formation and state for the table, I apprehend I have lost many. Amongst the "Cabbages" were the "Couve tronchuda," and "Jerusalem Kale." These were both sown in seed-beds, pricked out, and finally transplanted, and have grown away in good style. I looked for the "Couve" forming a head or heart, as other Cabbages, but they have all gone to leaves, as large as a coal-box, but no heart. The Jerusalem Kale partly run off to seed, and the others remain in broad leaf. No doubt the fault is in my ignorance; and having been a reader of your Paper for more than six years, as well as other horticultural works, there must be something very dull in me, or deficient in these works. May it not arise from the fact, that your contributors take it for granted that your readers are better informed than they really are? Or that while they provide for the proficient in the art, they neglect the instruction of the less informed. *A Learner.* [All amateurs should provide themselves with some book on routine gardening, as an addition to which the newspaper is most useful. Couve tronchuda does not heart.]

Brunsvigia Josephinæ.—It may perhaps interest some of your readers to learn that the treatment pointed out by me last year, for flowering the Brunsvigia Josephinæ, has fully succeeded again this season. I have now two of the smaller plants showing for flower, and two of the larger in full bloom; one or two others having now flowered consecutively two and three years. None have yet been repotted since I first had them from the Cape; and the breadth and substance of the leaves of those that were kept out of doors till the middle of November, as compared with the narrow and attenuated leaves of one that has grown all its time in the greenhouse (and which still shows no sign of flowering), testify to the fact that the want of success, in growing this kind of bulb, is almost, if not entirely, attributable to the too tender care that has hitherto been bestowed upon it. *Charles Leach, Clapham-park.*

Disease in Melons often originates at an early stage in the growth of the plant, either when it is transferred from the seed-pot, or in training after it is planted in the frame. I have seen healthy looking Melons die away suddenly, drooping as if the vines had been cut from the roots during hot sunshine; the roots, at the same time, being healthy. The cause of failure lay in the neck of the plant, being so much diseased that every channel had ceased to carry sap to the leaves. I am inclined, however, to think that a little care will, in most cases, prevent the evil. Last year my Melons suffered more or less from disease, the cause of which I pretty well understood, and this year I determined it to my satisfaction. I discovered the evil in this way—in potting the young plants from the seed-pot, I placed three plants in a pot; in one of the plants I made a slight bruise with my finger-nail, similar to a bruise occasioned by a grain of sand, when pressing down with the finger and thumb at potting time. I watched the progress of the sore; week after week it gradually increased, although the plants had the same healthy appearance as their neighbours. At this stage the plant had two Melons on it about half grown; by and bye the stem became diseased half-way through, and it increased rapidly until nothing more than the skin was left on the lower part of the stem. Nevertheless the leaves appeared healthy for many hours afterwards, but at last the sore proved fatal. In a second experiment I carefully potted three plants from the seed-pot, and when ready I planted them in the frame; but when the plants had commenced to run off, I slightly twisted one of them at the neck, as is too often done in training or by a current of air before the shoots are tied or pegged to their proper places. Bleeding took place instantly, but it did not appear to check the healthiness of the plant. This occurred in a 4-light pit, where the plants grew vigorously. When the Melons had attained the size of walnuts, the plants were trimmed and well watered; after watering, the bleeding matter that had congealed on the wound, became black, as though fermentation had taken place, when it rapidly increased, until all the tissue through the stem was diseased, the woody fibre decaying with it; the sap then ceased to flow, and the plant died. I accidentally bruised a plant at the neck in a similar way, when bleeding instantly took place. This being the only plant under the light, I lost all hopes of a crop; but as soon as I saw matter in the wound, I wiped it dry with a soft rag twice and sometimes thrice a day, taking care never to let the water touch the wound; at last it dried up, and the plant ripened three good-flavoured fruits. I have often had the branches go off in the same way, but I have always traced the evil to a twist in training, or where a leaf has been taken off, leaving the leaf-stalk to decay on the plant. *Wm. Culverwell, Thorpe Perrow.*

Herbaceous Plants.—Being a great admirer of herbaceous plants, I have frequently contemplated sending you a few lines, by way of an endeavour to recall the attention of cultivators to a class of plants that should never have been suffered to fall into neglect. To expatiate on their beauties would be superfluous, as their merits in that respect will scarcely be denied. I would only observe, that the beauty and interest of a garden may be greatly enhanced, both cheaply and easily, by a good selection of such interesting and ornamental subjects, and the borders or clumps kept constantly with something in bloom from February till December. I am pretty well acquainted with a garden (an old-fashioned one certainly), surrounded and intersected by 6 feet gravel walks, parallel with which are 6 feet flower borders. In the latter are three rows of permanent herbaceous plants placed 3 feet apart in the row; the taller behind, the intermediate in the middle, and the dwarfer sorts in front, and behind all, next the back alley, is a row of standard and dwarf Roses, with Narcissi, and other bulbs under them. These borders, although now greatly out of fashion, are often very much admired. In summer, the spaces between the permanent plants are filled up with showy annuals, biennials, &c., and throughout the summer and autumn they have a charming appearance. I am, however, not advising such an arrangement to be adopted by your readers. My object is simply to direct attention to the culture of the herbaceous hardy tribes of plants; let those who cultivate them, arrange them according to their own taste and circumstances. Again, there is the beautiful little Alpines; what a slender share of attention they enjoy, compared with their merits. *Querous.*

New Animal and Vegetable Food.—On the first establishment of the Zoological Society, I well recollect that it was set forth as being one of the principal objects of that institution to promote the introduction of new animals and fishes, useful and various, for the food of man; I was led to expect to see the silure and picture carp of the continent sporting in our rivers, and the guanaco and tapir convertible into saddles of meat, and

hams for the table. Now, although none of us may live to see that attainable, I do hope to hear that we should not charge in vain the fifth continent with not producing fruits or vegetables economically useful for the support and comfort of civilised man, when we never have taken any trouble to attain that end. I ask myself, were either Wheat, Oats, or Barley be, &c., fit for food in their native form? And then I say, why might not the Panicum lævinode of Mitchell, or other Grass growing seeds, be so improved by cultivation, as to make them fit objects for an article of export from that southern land to the old country? *C. P., of York.* [Possible; but not probable.]

Fairy Rings.—Most writers on this subject, if not all, have been imitators of Mr. Howitt, a favourite author of mine, but who is wrong in his theory as to the cause of these rings, at least according to my experience of them in this county. A great number of those which I have seen have only continued for one season. The diameters of the rings, or rather of the space within the circles, are of various dimensions—some only 3 or 4 feet, others from 10 to 20 feet. Other rings have continued for four or five seasons in succession, but every season in the same exact situation. I have been very particular on this point since I first saw Mr. Howitt's theory on their cause. One in a meadow near here has continued four years; the ring is 18 inches broad, and the space within the circle 24 feet in diameter. This is the largest I ever saw. The soil is a good rich loam 2 feet deep. In many cases which I have seen, the green mark has diverged outwardly or inwardly, for several feet, and returned to the true circle again. In some cases it has been broken off for a few feet. I have no theory on the subject, but according to my experience it is evident Mr. Howitt's is not a true one. I suppose them to be caused by the electric fluid; and yet I have one reason to doubt this, and that is, I never recollect seeing one on any but old Grass land. *W. Rothwell, Winwick.*

The Apple of the Dead Sea.—The following is an extract from Curzon. He made a somewhat singular discovery when travelling among the mountains to the east of the Dead Sea, where the ruins of Ammon, Jerash, and Adjeloun well repay the labour and fatigue encountered in visiting them. "It was a remarkably hot and sultry day; we were scrambling up the mountain, through a thick jungle of bushes and low trees, which rises above the east shore of the Dead Sea, when I saw before me a fine Plum tree loaded with fresh-blooming Plums. I cried to my fellow-traveller, 'Now, then, who will arrive first at the Plum-tree;' and as he caught a glimpse of so refreshing an object, we both pressed our horses into a gallop to see who would get the first Plum from the branches. We both arrived at the same moment, and each snatching at a fine ripe Plum, put it at once into our mouths, when on biting it, instead of the cool delicious juicy fruit which we expected, our mouths were filled with a dry bitter dust, and we sat under the tree upon our horses sputtering and hemming, and doing all we could to be relieved of the nauseous taste of this strange fruit. We then perceived, and to my great delight, that we had discovered the famous Apple of the Dead Sea, the existence of which has been doubted and canvassed since the days of Strabo and Pliny, who first described it. Many travellers have given descriptions of other vegetable productions, which have some analogy to the one described by Pliny; but up to this time no one had met with the thing itself either upon the spot mentioned by the ancient authors or elsewhere. I brought several of them to England; they are a kind of nutgall. I found others afterwards on the plains of Troy; but there can be no doubt whatever that this is the Apple of Sodom, to which Strabo and Pliny referred." Surely if the traveller, who found what he considers to be the "Apple of Sodom," had been a botanist, he would have been able to have told us more about the fruit than that it was a kind of nutgall. Has it been ascertained what plant it is that bears such Apples? *P. Mackenzie.*

On the Cultivation of the Melon in France.—The finest kind of this fruit is the Cantaloup, and is brought to great perfection in the environs of Paris, where it is produced in immense quantities. It is covered with tubercles or warts, from which appearance the French give it the distinctive *soubriquet* of "Melon *galeux.*" This delicious fruit averages 7 or 8, to even 10 lbs. in weight, and exceeds 2 feet in circumference. The finest Melons could be bought in Paris this season for 15*d.* and 20*d.* The method adopted by the best growers near Paris, among whom may be named Messieurs François and Decouplé, is as follows: When the young plant has formed its second or third leaf beyond the cotyledon, the stem is pinched off, or "stopped." The effect of this is to make it throw out two lateral branches, which again are stopped beyond their sixth or seventh leaf. The plant now comes into bloom, and as soon as the fruit is set, two, or at the most three, are selected as the most promising, and all subsequent ones are pinched off as they form, so as only to have this limited number on one plant, to preserve its vigour and increase the sap. The seeds of this Melon are found to vegetate, even when transmitted to the East and West Indies, taken from the fruit as brought to table. They should be merely wiped and dried, but not washed. The French gardeners follow the same system in growing the immense orange-coloured Pumpkin, or "Potiron," so extensively used to make vegetable soup on "meagre days." When it is desired to produce very large Pumpkins, only one fruit is retained on each plant, all the others being suppressed. It may be well to mention, as the result of careful observation, that the climate of Paris enjoys a far greater portion of solar heat and light than the meridian of London. *B. C. H., London, Sept.* 11.

Disasters in Gardening.—Some years ago I walled in an acre of ground for a garden. I got the interior borders ready for planting fruit trees, and taking Loudon's "Encyclopædia of Gardening," I chose from his lists the names of the best fruit trees of different sorts. These I got at a first-rate nursery, and handed over to my gardener to plant. He professed to be competent to do this in the best manner. Nothing could possibly be more unsatisfactory than the result. My crops, except Cherries, are indifferent, and many trees have not borne ripe fruit, from being planted in a bad aspect. With regard to the exterior walls, I took a different plan. I wrote to the *Gardeners' Chronicle*, saying I had so many yards of east, west, north walls, &c., and I asked what kinds of trees, and how many, I should plant in each aspect. I followed the directions given in answer, and I have now plenty of fine fruit ripening on my outer walls—nothing could do better. I do not know what to do with the inside trees. My best Pears are against the north wall, Crassane, Chaumontelle, and Glout Morceau; and my south is thrown away on Cherries. They have been eight years there, and would be troublesome to transplant. Will they do any good on the north? [No.] *Cavanensis.*

Limonia laureola.—This Limonia stood last winter in Mr. Skirving's nursery, near Liverpool, quite exposed, in a pot; not a leaf was injured. I saw it last April, after weathering the last severe winter, as green as a Leek, while Laurel, Yews, and scores of other things, were brown and nearly dead. It has a peculiar and aromatic smell, accompanied by a fine and noble appearance, and is altogether a splendid thing. How it has been obtained is unknown. *Thos. Williams, Haigh-hall Gardens, Wigan.*

Societies.

Tardebigg Horticultural Show and Cottagers' Gardening Society.—The first meeting and show took place in Hewell Park on Wednesday. It has been suggested and established by Lady Harriet Clive for the purpose of encouraging habits of industry among the neighbouring cottagers, and by fostering a taste for horticulture to increase those home-pleasures which are the green spots and brooks by the way in the poor man's journey of life; and it is only one of the many acts which are testifying that lady's constant thought and regard for those around her who have been blessed by Providence with but a small share of this world's good. The hour fixed for opening the show was 2 o'clock, and before that time a great number of well-dressed people had assembled from Bromsgrove, Redditch, and other neighbouring towns at the park gates; for, in order to lend an additional attraction to the meeting, the Hon. Mr. Clive had announced that the beautiful gardens adjoining the mansion should be thrown open to those who attended the show. When the crowd first entered the park the first thing that called their attention was a group of tents, in which were arranged the collections of fruits, flowers, and vegetables, sent for exhibition and competition. The largest contained the cottagers' vegetables, and a magnificent show of flowers and fruit from the gardens of some neighbouring gentlemen, but principally from the hothouses and conservatories of Hewell Grange itself. In an adjoining and smaller tent were the specimens sent by parties who did not come under the denomination of cottagers. Tickets of merit were adjudged to such of these as were thought worthy, and the exhibitors who obtained the greatest number of these also received prizes. The Yeomanry band was stationed near and played at intervals during the afternoon. The Hon. R. H. Clive and his son, Robert Clive, Esq., had been busying themselves all the morning in the arrangements, and Lady Harriet, with her daughters, Mrs. Pepys, and two or three other visitors from the house, were also early on the ground welcoming the visitors, and evidently sharing in the general pleasure. About three o'clock the children from the National Schools at Bromsgrove, something like 1000 in number, were brought on to the ground in 22 waggons, drawn by two horses each. They carried banners and boughs, and added not a little to the life of the scene. They were seated upon forms round about the tents, and seemed to enjoy their holiday mightily. After looking round the tents, the company strolled off to the gardens, and distributed themselves among the picturesque and winding walks of the rockery, through the conservatories, or the tasteful parterres and soft treading turf of the terrace in the French garden. The day was beautifully fine, and the company seemed full of admiration and thoroughly delighted. The gardens were in a high state of cultivation, and kept with a care and attention which bespeak the interest which Mr. Clive takes in them, and do infinite credit to the skill and taste of his gardener, Markham. Towards the close of the day, Mr. Clive distributed with his own hands the prizes, which varied in amount from 5*s.* to 3*s.* The judges were Mr. Robson, gr. to Lord Lyttelton; Mr. Smith, gr. to Captain Galton; and Mr. Dytch, gr. to Captain Taylor. With regard to the show itself, we must add our testimony to the very superior quality of many of the productions shown from the cottagers' gardens; they were, indeed, such as could not have been obtained without a good deal of practical knowledge and much attention. The Potatoes which Mr. Clive noticed were truly beautiful specimens of that favourite root; the Kidney Beans and Apples were also particularly fine. The tradesmen and superior class of workpeople did not exhibit so freely as might have been wished, owing, we believe, in some degree to a want of perspicuity in some of the rules, which will doubtless be set right before another meeting. As to the merely honorary part of the exhibition it was in itself a show. At the upper end of the large tent was a table of fruit from the Hewell hothouses, comprising fine Ischia Figs, Jamaica, Antigua, Queen, and Santa Cruz Pines, black Hamburgh Grapes, double Swalsh Peaches, Elruge Nectarines, Greengages, Apples, Pears, and Cherries, all in the highest state of perfection, and betokening that Mr. Markham was a grower worthy of such gardens. Towards 6 o'clock the exhibitors took away their collections, the 22 waggon-loads of children wheeled off the ground amidst the most vociferous shouts and hurrahs of their joyous burdens, and the general company gradually dispersed to their several homes. *Abridged from the Worcester Herald, Sept.* 7.

Royal South London Floricultural, *Sept.* 4.—This, the last exhibition of the season, was well attended; the show itself was above an average one. Dahlias, of which there were some admirable specimens, were produced in great numbers. Fancies are rapidly advancing to perfection in shape; we shall soon see them as unique in this respect as the ordinary varieties. The prizes were awarded as follows:—Amateurs and Gardeners, 24 varieties: 1. Mr. Robinson, gr. to I. Simpson, Esq., Pimlico, with Duke of Wellington, Purple Standard, Mr. Seldon, Queen of Lilacs, Thames-bank Hero, General Negrier, Mrs. C. Bacon, Imbricata, Lady St. Maur, Standard of Perfection, Yellow Standard, Richard Cobden, Fearless, War Eagle, Essex Triumph, Scarlet Gem, Nonpareil, Beauty Supreme, Louis Philippe, Queen of the Isles, Shylock, Duchess, Sir F. Bathurst, Oakley's Gem; 2d, Mr. Black, gr. to E. Foster, Esq., Clewer Manor, near Windsor, with Earl of Clarendon, Fearless, Richard Cobden, Mr. Seldon, Negro, Marchioness of Cornwallis, Fame, El dorado, Sir F. Bathurst, Charles Turner, Seraph, Queen of Lilacs, Duke of Wellington, Black Prince, Princess Louisa, Essex Triumph, Princess Radziwill, Mynn, Shylock, Purple Standard, Duke of Cambridge, Unique Superb, Hector (Turner's) Andromeda; 3d, Mr. Allen, Shacklewell; 4th, Mr. Cook, Notting hill; 5th, Mr. Weedon, Hillingdon.—12 Blooms: 1st Mr. Rowden, Adbury House, near Newbury, with Earl of Clarendon, Mrs. Seldon, Hero, Marchioness of Cornwallis, Black Prince, Mr. Seldon, R. Cobden, Duke of Cambridge, Seraph, Grenadier, Gem, Princess Radziwill; 2d, J. Edwards, Esq., Holloway, with Thames-bank Hero, Fearless, Andromeda, Beeswing, Duke of Cambridge, Duke of Wellington, Mr. Seldon, Earl of Clarendon, Sir. F. Bathurst, Snowflake, Shylock, Black Prince; 3d, to Mr. White, Chelmsford; 4th, Mr. Bennett, Dulwich; 5th, Mr. Battie, Erith; 6th, Mr. Hunt, jun., Paddington.—6 Fancy Varieties: 1st, Mr. Black, with Miss Compton, Elizabeth, Madame Bresson, Comte de Flandre, Miss Blackmore, and Gaeparine; 2d, Mr. Robinson, with Comte de Flandre, Emperor de Maroc, Madame Bassaville, Floral Beauty, Lady Grenville, Madame Wachy; 3d, C. Lockner, Esq., Paddington; 4th, Mr. Rowden. Nurserymen, 24 Blooms: 1st, Mr. C. Turner, Royal Nursery, Slough, with Grandis (Turner's), Sir F. Bathurst, Mrs. Seldon, Thames-bank Hero, Earl of Clarendon, Negro, Snowflake, Mr. Seldon, Queen of Lilacs, Marchioness of Cornwallis, Richard Cobden, Andromeda, Black Prince, Miss Hawtrey, Essex Triumph, Duke of Wellington, Grenadier (Turner), Nonpariel, Duke of Cambridge, Utilis, Seraph, Frederick Jerome, Yellow Standard, Fearless. Equal 1st, Mr. J. Keynes, Salisbury, with Magnificent, Cleopatra, Princess Louisa, Snowflake, Essex Triumph, Richard Cobden, Yellow Standard, Queen of the East, Bathonia, M. Gauberte, Sir F. Bathurst, Mr. Seldon, Mrs. Bacon, Gen. Negrier, Marchioness of Cornwallis, Crocus, Toison d'Or, Miss Vyse, Fearless, Dulcet, Shylock, Golden Fleece, Buffalo Girl, Sarah; 3d, Mr. Bragg, Slough; 4th, Mr. Gurney; 5th, Mr. Hunt, Paddington. Fancies: 12 blooms: 1st, Mr. C. Turner, with Striata perfecta, Belle de Nogent, Mrs. Hansard, Unique, Miss Compton, Elizabeth, Post-secretaire, Hane, Dulce's Lady Grenville, Jenny Lind, Mr. Labouchere, Comte de Flandre; 2d, Mr. Keynes, with Miss Compton, Elizabeth, Highland Chief, Comte de Flandre, Bell Bonquet, Rainbow, Candidate, Striata perfecta, Miss Blackmore, Lady Grenville, Forget-me-Not, Jeannotte; 3d, Mr. Bragg.

Hollyhocks were shown in spikes, and in capital condition, by Mr. Bircham, of Hedenham, Norfolk, and by Mr. Chater, of Saffron Walden; there were also numbers of single blossoms, which in this state looked miserable. They should be shown in spikes, or not at all.

Verbenas were poor. Some pretty seedlings were sent by Mr. G. Smith.

Seedling Dahlias.—These were more numerous than good. There were several useful flowers staged, but few novelties; among the latter, Mitchell's Queen of Beauties was the most attractive—colour, waxy soft white, with clear rose tip, and very delicate, but apparently having a treacherous centre; the form of its petal and outline are good. Bragg's Admiral is a good useful lilac, and appeared to be very constant. Others consisted of Keynes's Summit of Perfection, dark purple; do., Honourable Mr. Herbert, shaded red and yellow, both full flowers; Stein's Nil Desperandum, good heavy scarlet; Turner's Grandis, much the same colour; Holmes' Barmaid, very promising white; Do., Roundhead, dull buff, of fine form; Soden's Beauty of the Grove, small and neat, and the darkest flower we have seen. Edwards's Mrs. Hansard is a noble fancy, yellow tipped with white; this flower is large and of very fine form, decidedly the best of its class. A large number of blooms were put up for inspection, but we were unable to ascertain which flowers received certificates, on account of the crowd which had assembled before the cards were put on.

Review.

The British Flora, comprising the Phænogamous or Flowering Plants, and the Ferns. By Sir W. J. Hooker, K.H., and G. A. W. Arnott. The 6th edition. 12mo. Pp. 604. Longmans.

This is a particularly nice edition of a well-known and very useful work, aided by some lithographic drawings executed by Mr. Fitch, with his usual accuracy and admirable taste. To some it will be more acceptable than "Babington's Manual," because of its including more details of various kinds. We should, however, advise all students of British plants to use them both; in that way they will be able to compare discordant opinions concerning species and genera, and perhaps to draw their own conclusions. Upon this subject, however, we are tempted to quote in this place the author's words: "What is a genus, or what is a species, is a point upon which scarcely two botanists are agreed at the present day. With regard to the former, however

much it may be necessary to subdivide in a system comprehending the known plants of the whole world, so as to retain only a limited number of species in each genus, the same does not apply to a local Flora; and it is there preferable to constitute sections or subgenera, particularly when the limiting characters are inconstant, difficult, or obscure. A *species* cannot be so treated; it is formed, by our Maker, as essentially distinct from all other species, as man is from the brute creation; it can neither for convenience be united with others, nor be split into several; but the difficulty is to ascertain what is such a primitive or natural species; and it is here so great a difference of opinion exists. Some pronounce a species to be distinct if it presents a different habit or appearance to the eye, particularly if this be constant, although often indefinable: others consider it a species, although exhibiting no difference of aspect, provided it can be defined, even although the differences are so minute that they can be detected only by the microscope; while a third party are of opinion that the validity of a species may be tested by cultivation. The authors are not inclined to believe that any one of these tests is sufficient. Of all the works of Creation, we have a specific account only of man; but as the others appear to be formed on the same plan, there is a strong presumption in favour of those arguments which assimilate the species of plants to what we know of the human race. With regard to mankind, it is universally acknowledged that there now exists so great diversity between an inhabitant of the torrid and an inhabitant of the frigid zone, and even of any one part of the globe and of another, that it can only be accounted for on the principle that each succeeding generation has a tendency to recede more and more, in general appearance, from the original type; and if we apply this to the vegetable kingdom, we must at once allow that, although cultivation may sometimes in a single year or two satisfactorily show that two supposed species are the *same*, a thousand years' cultivation cannot prove them *distinct*. The more we cultivate a plant, or the more it is limited in its wild state to a particular climate or place of growth, the more permanency is given to the peculiarities of what was originally derived from the same root, or even seed-vessel, of another apparently widely different form. Hence a rare mountainous plant may frequently be a mere alpine permanent state of some common lowland species, or a Swedish species the more northern race or state of a southern one; and it is from this cause that we see in our gardens so many called species (as in the genus Achillea), which cannot now be referred satisfactorily to any of the wild ones, although primarily derived from them. Knowing, then, this tendency of Nature to give permanency to a variety of forms obtained from one primitive species, there appears to be less violence done to her laws by combining too much, than by subdivision, unless where there is an anatomical or physiological distinction. Linnæus took nearly all his specific characters from conspicuous parts, especially from the stem and foliage, and they were therefore natural; but at the present day we are prone to select minute ones: of these some are of trifling value, while others, sufficient to constitute subgenera, are connected with the habit of the plant, and should therefore not be neglected. Indeed the time may ere long arrive, when what are now called genera or subgenera will alone be considered species, and another Linnæus be requisite to reduce the chaos into order. In the meanwhile, we have endeavoured to steer a middle course: the species admitted in former editions are seldom reduced, unless where it was found that the characters were insufficient or variable; and as rarely has sanction been given to those which have been split off from other species, by the too-refined ingenuity of the German, Swiss, and modern Swedish botanists. If in one or two cases this neomania has been yielded to, it has been more on account of the remonstrances of the author's friends, who had opportunities of examining the living plant, than from any conviction of either the necessity or utility of so doing." In the justice of these views we may concur, but who is to apply them? and how?

The reader will find in this edition the authors' funeral discourse upon the once celebrated Linnean system. It will no longer answer the purpose of booksellers, because their customers have become too intelligent to occupy themselves with puerilities; and it is clear that the counsel who have for a quarter of a century been defending the sexual system, have now thrown down their briefs in despair.

Garden Memoranda.

Botanic Gardens, Glasnevin.—There is now in flower in this establishment the rare Allardia tomentosa (Decaisne), which is a new genus to our British collections, besides being important for its locality, viz., on the Thibet frontier, at an elevation of 12,000 feet. The plant when growing is very pretty, and will become a great favourite with those who look after plants suitable for rock-work. The large pink flowers, contrasted with the very woolly leaves, make a fine appearance. The stems rise, or rather grow, about 10 inches long, trailing on the surface of the ground. In this garden, from the same situation, are also specimens of the Potentilla rigida, of Wallich, a fine species, allied to P. fruticosa. It is very pretty, growing about a foot high, with large bright yellow flowers. The seeds from which both plants were raised were presented by Major Madden.

Bodorgan Hall, Anglesea, the seat of O. F. Meyrick, Esq.—It has been the custom for strangers visiting Wales to decry the attractions of the Island of Anglesea, and to devote all their attention to the mountain scenery on this side, or in the immediate vicinity of the Menai Straits. The country appears somewhat flat and barren about here, though this aspect is relieved at intervals by pleasing knolls and fertile valleys. But there is one spot adjacent, a perfect oasis in the desert, a most delightful mansion and park—the seat of Owen Fuller Meyrick, Esq., a descendant of one of our most ancient and highly respected Welsh families—sheltered by fine woods from the northern and western winds, on an eminence, gently undulating, and with an incline to the southward and eastward, herds of deer frolicking on the green sward, shaded walks, the waters of Carnarvon bay rolling in front, at the foot of the hill, some distance towards the interior, so as to present at high water the appearance of a vast lake, with the Carnarvonshire mountains in the distance; the whole furnishing *a coup d'œil* that is truly enchanting. But even this brilliant scene is eclipsed by the gardens, which are admitted to be the most perfect and best conducted in Wales, and may vie with many of the first character in England. The flower-garden is spacious, well stocked with the choicest plants, and tastefully laid out and preserved; the Vineries and Pineries are on the best principle, the hothouses exhibit a profusion of Orchids, the fruit and kitchen-gardens are in exquisite order, the shrubberies are carefully attended to and well arranged, and the Tobacco plantation is an object of much curiosity to strangers. The forestry and gardening departments are under the care of Mr. Ewing, who resides in a neat little cottage, with a turf before it on which fairies might love to dance, and the water not a stone's throw distant, and who has great pride and satisfaction, by permission of his employer, in showing respectable visitors over the grounds and gardens, and paying them every attention. The railway station being only about a mile from this delicious spot, considerable numbers have availed themselves of the privilege, during the last month or two, and we should be sorry indeed were any persons, fond of sylvan scenery, admirers of art and nature combined, lovers of order and neatness, and in search of the picturesque, to leave Wales without making this excursion. *Abridged from the North Wales Chronicle.*

Miscellaneous.

Wintering the Carnation.—As winter will soon approach us, perhaps the following plan of wintering the Carnation may prove acceptable. My frame stands on legs, and has a false bottom 8 inches from the ground, well drilled with a 1½-inch auger. On this bottom I put a layer of potsherds and brick-rubbish, and on these my pots (48's, each containing two plants) are placed. I then fill up to the rims with a compost of three parts cinder-ashes and one part sawdust, with a small quantity of powdered charcoal, all well mixed. In this mixture the plants may be watered without the least fear of injury from mildew, &c., as the water passes off freely, and no damp is generated in the frame from the earth beneath. In this way I have grown Carnations, &c., for a number of years, and have always had an extremely healthy stock. I have false bottoms in my frames, because I use them for other purposes, such as working Dahlias and growing Cucumbers in, &c. *Alpha, in Beck's Florist and Garden Miscellany for September.*

Method of hardening Objects in Plaster of Paris, and rendering them like Marble.—Take 2 parts of stearine, 2 parts Venetian soap, 1 part pearlash, and 24 to 30 parts of solution of caustic potash. The stearine and the soap are cut into slices, mixed with the cold ley, and boiled for about half an hour, constantly stirring. Whenever the mass rises a little cold ley is added. The pearlash, previously moistened with a little rain-water, is then added, and the whole boiled for a few minutes. The mass is then stirred until cold, when it is mixed with so much cold ley that it becomes perfectly liquid, and runs off the spoon without coagulating and contracting. Before using this composition, it should be kept for several days well-covered. It may be preserved for years. Before applying it to the objects, they should be well-dusted, the stains scraped away, and then coated by means of a thick brush with the mass as long as the plaster of Paris absorbs it, and left to dry. The coating is then dusted with leather or a soft brush. If the surface has not become shining, the operation must be repeated. *Archiv der Pharm.*, lvi. p. 327.

Cure for Serpent Bites.—The following account of the use of the seeds of a tree growing on the table land of the Cordillera, and called by the natives "Cedron," was communicated by M. Herran, chargé d'affaires for the republic of Costa Rica, in a letter to M. Jomard, and by him to the Academy of Sciences at Paris. "In the year 1828 some Indians brought to the market of Carthagena some seeds of the Cedron, and, to show their value, caused animals, as well as themselves, to be bitten by the most dangerous serpents, called toboba, corail de la Montagne, &c.; the rapidity with which the effect of the poison was neutralised was such that as much as a doubloon (3*l.* 6*s.* 6*d.*) was paid for a single seed. During my stay in Central America, I have myself been obliged to make use of the Cedron seed on eight occasions. It is applied as follows: 5 or 6 grains of the seed are rasped, and the powder, in a spoonful of brandy, is swallowed by the patient; next a piece of linen soaked in brandy, and powdered with more of the seed, is placed upon the wound; the patient is then left to himself, and seldom requires another dose, the cure being perfect. I have employed the same substance with success in intermittent fevers which had resisted the action of sulphate of quinine." *Comptes rendus.* [We are not informed what this Cedron is.]

On the Constituents and use of the Jerusalem Artichoke. By Messrs. Payen, Poinsot, and Férey, in "Journ. de Pharm.," xvi. p. 434.—"The Jerusalem Artichokes which the authors used for their experiments were grown upon a sandy soil of moderate goodness, which had been manured with ammonio-phosphate of magnesia. They contained in 100 parts, 76.04 water and 23.96 dry substance. The dry substance yielded on combustion 4.24 ash and 2.16 nitrogen. This is twice as much as is obtained from Potatoes, and somewhat more than the Cerealia contain. There was further obtained from 100 parts of Jerusalem Artichoke 0.87 of fatty matters, of which one was liquid, the other solid. This quantity is likewise twice as great as in the Potato. Water to which a little muriatic acid was added extracted 1.56 per cent. pecten, which was precipitated by spirit. The insoluble residue was treated with water to which one-twentieth ammonia was added, and expressed. It furnished an aqueous liquid, from which muriatic acid precipitated gelatinous pectic acid, which after washing and pressure amounted to 3.76 per cent. The dry substance, wholly exhausted with æther, was now washed with alcohol of 0.850 and 0.833. The crude saccharine matter was thus obtained, but still mixed with a little chloride of potassium and nitrogenous substance. It formed 68 per cent. of the dry substance, or 16 per cent. glucose for the fresh tubers. This large amount of sugar induced the authors to repeat the experiment. The tubers were rubbed to a paste and fermented; from the alcohol obtained 14.7 per cent. of glucose was calculated. Besides these constituents, albumen, gum, and two other nitrogenous matters, were detected in the tubers. The following are the tabulated results of the analysis:

Water	76.04
Glucose and other saccharine substances	14.70
Albumen and two other nitrogenous substances	3.12
Cellulose	1.50
Inuline	1.86
Pectic acid	0.92
Pectine	0.20
Salts	1.29
	100.00

The ash of the Jerusalem Artichoke contained the following constituents. I. is the analyses of some that were grown upon a soil manured with ammonio-phosphate of magnesia, and II. of purchased tubers:

	I.	II.
Silica	2.00	6.95
Carbonate of lime	4.12	10.23
Carbonate of magnesia	1.94	
Phosphate of lime and magnesia	33.50	16.62
Alumina	1.44	
Chloride of potassium	8.36	10.75
Sulphate of potash	11.16	10.66
Phosphate of potash	28.40	8.45
Carbonate of potash and traces of soda	9.93	36.34

The Jerusalem Artichoke also contains a small quantity of a violet pigment, which is deposited in the cellular tissue beneath the epidermis. According to this investigation, therefore, 100 parts of the Jerusalem Artichoke contain 23.96 parts of nutritive substance, and they are certainly well adapted for the fattening of pigs and cattle. *Chemical Gazette.*

Wash for Fruit Trees.—I am, at this season of the year, frequently asked what is the best wash for fruit trees, both trunk and limbs. The following has given me the best satisfaction of all the various mixtures I have tried, and I have used no other for at least 12 years:—I use a large vessel, say a tub, made by sawing a molasses hogshead in two, at the bung, which will hold about 70 gallons; in this tub I put a wheelbarrow load of yellow clay, and an equal quantity of fresh cow manure, covering it with water. After soaking and mixing a day or two, I add half a bushel wood ashes, 1 lb. of sulphur, 6 or 8 lbs. of soft soap, and mix well together; then slake half a peck of lime, and add to the above, using water sufficient to make the whole about the consistency of thin cream, which will nearly fill the tub; mix well together for several days; then, with a common whitewash brush (an old floor brush will answer), I paint the bodies of the trees, having first used a smaller brush to paint the crotches of the limbs, and the limbs themselves, as far as possible. I think any gentleman trying this wash, or paint, if you please, will find it to give him perfect satisfaction on every kind of fruit tree in ordinary cultivation with us. *Captain Lovett, in Hovey's Magazine of Horticulture.*

Mangold Wurzel.—We observed that Beet-root cut below the collar, produced neither leaves nor buds, even when in the earth. If Beet-root is pulled up and cut below the collar, it will not vegetate any more. The roots may therefore be exposed all the more to air and light, in order that fermentation may be prevented, since the development of leaves and buds need be no longer feared. The wound thus caused in the roots never causes them to alter or rot, if they are exposed to a temperature of from 53° to 59° F., in dry air. The wound soon heals, and the roots can be preserved without rotting. In order to ascertain by experiment the effect of this mode of keeping Beet-root, two lots of roots, the juice of which marked 7°, were taken in the month of November, 1848, the roots of one lot being cut across below the collar, and the roots of the other lot being in the state in which they are usually stored up. The two lots were placed in a dry spot, out of the reach of frost, and in which the air was renewed; at the end of February the juice was extracted from them. Those roots which had their collars had nearly all vegetated, and gave a juice marking 3°; those, on the other hand,

which were cut across, had neither leaves nor buds, and gave a juice marking from 6° to 7°. *Comptes rendus.*

Transmutation of Species. — The state of natural history in India reminds us continually of Pliny, and the mass of facts, fiction, shrewdness, and credulity there preserved. Occasionally its revelations rival the most recent experiments or speculations of our own philosophers. Bhubdev Teewaree, and other learned pundits of Almorah, affirm that the fact or fable of the transmutation of the Cerealia by means of frequent cutting or browsing has been known in India from time immemorial. The late Mr. G. T. Lushington informed me, that the same belief prevails at Bhurtpoor. According to Bhubdev, Wheat becomes Barley; Barley, wild Oats (Avena fatua); Rice, Panicum furmentaceum; while mundooa, Eleusine corocana, degenerates into Khurooa or Jhurooa, which seems to be Eleusine indica. They do not seem to have any tradition as to how and where the finer Cerealia were obtained. Dr. Griffith (p. 3) mentions the wild form of Oryza sativa as common in Silhet. *Major Madden, in the Journal of the Agricultural and Horticultural Society of India.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

As we may soon look for cold weather as a natural consequence of the season, it behoves us to secure all our more tender plants immediately, lest we be taken by surprise, as many were last year. But for the present, even in less favourable localities, we would only put the most tender of our greenhouse plants under cover, as we dislike crowding the houses as long as it can be avoided, and there are many plants whose constitutions will allow of their being freely exposed for some time longer; as a familiar instance of this we may mention the Cytisus, Acacias, &c., and as the flowers of many such plants are valuable through the winter, the continued exposure will retard their season of blooming. In very cold localities, Chrysanthemums in pots should be placed in a cool house, or under the shelter of a wall, where they can be protected by drawing down a canvas in severe weather. Many plants whose wood is properly ripened may at once be removed to a cool light shed facing the north, or placed beneath the stage of the Geranium house; the situation should however be such, that frost can be effectually excluded without entirely depriving the plants of light. These will include Fuchsias, Hydrangeas, Plumbago capensis, Hibiscus, Brugmansia sanguinea, Erythrina, Bouvardia, Hedychium, Canna, Liliums, and a great many others that have done flowering, and only require protection from frost, and a moderate exposure to the light. By removing these, a greater space will be afforded for plants with healthy foliage. Balsams, Cockscombs, and other annuals which have been cultivated for decorating the plant houses during the summer must give place to the winter occupants, as they require the space.

FORCING DEPARTMENT.

PINERIES.—As the necessity for using artificial heat increases, considerable attention must be paid to regulating the temperature. The night temperature should be kept steadily ranging from 63° to 68°, with a bottom heat of 85°. As long as the daylight is strong enough to keep the plants in a healthy growing state, great care should be taken to prevent them receiving any check, and where the heat is supplied by dung linings, &c., this will require special attention. Examine carefully the wants of the plants as regards water; avoid either extreme, and syringe only in very fine weather, and then with water of the same temperature as the pits. Care must be taken not to syringe to such an excess as to allow the moisture to accumulate about the stems and hearts of the plants, as considerable injury will be done thereby during very dull weather. Admit air freely in such weather, to assist evaporation, even if extra fire heat is required to enable you to do so. VINERIES.—The pruning of Vines intended for early forcing should not be longer delayed, or they will be liable to bleed. The course of proceeding should be similar to that recommended for the early Peach-houses. The old, loose rough bark should be rubbed off, and the whole of the plants washed over with sulphur and soft soap. The glass should be cleaned, and all the interior of the house painted; every precaution should be taken to smother effectually insect life in every stage. The old worn-out soil should be removed from the surface of the border, as far as this is practicable without injury to the roots, and replaced by a rich compost, consisting of charred turf, fresh horse or deer dung, and lime rubbish, with a portion of rough bone dust. CHERRIES.—The forced Cherries will now be losing their leaves, and should, with the house they occupy, be treated exactly as was recommended for the early Peach-houses some weeks back. MELONS.—Unless these can be freely supplied with top and bottom heat, thereby allowing the admission of a free current of air, they will be of little further value; and, as the fruit ripens, they may be cleared out, to make room for various plants during winter. Take care, however, of those growing in pits which are furnished with the necessary facilities for keeping up the requisite amount of heat. We had such a house last year, from which the first fruit was cut in the first week of May, and which continued bearing in an uninterrupted succession till the end of October; and many fruits were cut after that; the last was used near the end of December.

FLOWER GARDEN AND SHRUBBERIES.

The propagator must be very active to get his cuttings struck while he has the advantage of genial weather; and that they may have the chance of getting fairly established before winter sets in, a strong force should be kept at such work till it is completed. If the cuttings are put in early, they have a much better chance of striking, and have a longer time to establish themselves, so that one early-struck well-rooted plant will go as far as two or three weakly things at planting out season; and when we consider the numbers of the latter that dwindle away during the winter, the disadvantage of delay is too obvious to need more comment. Young plants of Campanula pyramidalis, Antirrhinum, and other plants which require a slight protection, should be placed in a suitable situation. All these arrangements should, as far as practicable, be completed at once, so that the hands may be clear when the weather becomes so severe as to render it necessary to take up and pot the old plants required for another season. To this end, pits, frames, boxes, pots, &c., should be prepared, that when the job commences it may be completed as quickly as possible. No time should be lost in commencing any extensive alterations or improvements which it is proposed to carry out this autumn, as the ground is in a much more workable state now than it will be two months hence, and any shrubs shifted immediately will have time to strike fresh root before winter.

KITCHEN GARDEN.

If Cardoons will be required for the use of the kitchen before November, a few should now be earthed. It is a common practice to wind haybands round the stems, to keep the soil out of the hearts of the plants; but there are several objections to the practice, and particularly in very cold or wet ground. In such cases, the haybands unavoidably absorb moisture from the surrounding soil, and are thereby decomposed, thus forming a harbour for insects, and a natural conductor, by which the frost is admitted, where the object should be to exclude it. In such ground, we would prefer to surround the stem with a casing of sand, or fine coal ashes. In very dry sandy soils, the evil does not exist to so great an extent, and to such ground an admixture of sand or ashes would be injurious; but where it is of a stiff clayey nature, such an admixture will ameliorate the texture of the soil, besides being more suitable for the preservation of the crop. In any case do not allow the outer leaves to be stripped off, as they are much hardier by reason of their exposure, and form a natural guard to the more tender leaves within. Where soil is used, let it be as dry as possible, and made fine with the spade before it is placed round the plant. Let any plants be taken up, which, in spite of the rich manure given them, are beginning to run into flower. As they are of no use when blanched, but as the foliage is so noble, we generally make use of these by planting them in open spaces about the clumps in the pleasure ground. If the ground is properly enriched, they form very interesting and striking objects. They are excellently adapted for planting near the margin of water. The spring sown Onions should now be taken up and laid out to dry thoroughly before being strung and hung up for the winter. As the weather of our autumns is so very precarious, they should, if possible, be spread out thinly in an open shed; but if such a place is not at command, the next best is a hard dry gravel walk, from which the rain can pass freely off. Get them under cover, by all means, as soon as possible, but do not allow them to be thick together, nor be in too great a hurry to bunch them up. A quantity of Parsley should now be gathered and dried; it answers as well as the green for every purpose except garnishing, and, by securing a supply before hand, the demand of green leaves during winter is considerably diminished. Do not neglect to gather in due season ridge Cucumbers, Nasturtium seeds, Radish and Bean pods, Chillies, and other matters required for pickling and preserving.

State of the Weather near London, for the week ending Sept. 12, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 17th, 1843—therm. 84 deg.; and the lowest on the 17th, 1840—therm. 29 deg.

Notices to Correspondents.

BOOKS: *J Patterson.* Lindley's "Theory of Horticulture."—*G G.* If you wish to understand the subject you *must* begin at the beginning. Make yourself master of "School Botany."

CLEMATIS: *E G.* Strike the ripe wood in a little heat, in the same way as China Roses, or propagate by layers.

COUNTRY SHOWS: *NC.* The judges at the Dorchester show, who disqualified a collection of 12 greenhouse plants because of its having Zauschneria californica in it, were perfectly right.

CUCUMBERS: *J C.* Your Essex Hero is 22 inches long, nearly 8 inches in girth, very straight, short-necked, soft and spongy. We cannot understand to what purpose such fruit is to be applied.

DOUGLAS FIR: *G A.* We have not seen a weeping variety of it.‡

GLASS: *J H G.* We should use the patent rough plate for the roof; as to the sides, they may as well be glazed with common sheet. You will have less direct light with the former, but more diffused light. The size is immaterial; you had better consult price and convenience, only remember the larger the squares the less ventilation there will be by laps, and the more special ventilation must be provided. The more you have of the latter the better.

GRAPES: *G O L.* We think your plan of glazing the border with glass pantiles a very good one, but we cannot give prices. It is to be recollected that if your Vine roots are already in cold heavy clay at a distance below the surface, glazing the borders will not help you, unless you previously raise the roots.

HEATING: *H W B.* For Polmaise, which would suit your place, apply to Mr. Smith, of Leamington; or an Arnott stove, if you can get your servants not to mismanage it, would be quite sufficient. It might be placed in the wall between the two places. There is also an ingenious open stove by Mr. Pearse, of Jermyn-street, which might suit you; only, being open, it cannot be kept constantly alight without occasional attention.

INSECTS: *H S.* The caterpillar sent is that of the eyed hawk-moth (Smerinthus ocellatus). *W.* — *T C.* Thanks for the specimens, some of which have changed their skins, and become blue instead of black. *W.*—*J M M.* The caterpillar sent is that of the elephant hawk-moth (Deilephila elpenor). *W.*

MORPHOLOGY: *J L S.* Such appearances in Maize are by no means uncommon. They show how strong the tendency is in the unisexual Grasses to assume the usual hermaphrodite state.

NAMES OF FRUITS: *R W.* The Keswick Codlin, a sort extensively cultivated as an abundant bearer, and a good kitchen Apple.‖

NAMES OF PLANTS: *Erzeroum.* 294, Cnicus Benedictus; 562, Cirsium acaule.—*G W.* Stanhopea Bucephalus, and some Micropiper which we have not time to determine. That Vanda you mention is in cultivation!—*Adelaide.* Catalpa syringifolia; the leaves were so broken we thought they were lobed.—*A Gardener.* Phlox picta and Hardenbergia monophylla. Your Luculia will flower in the spring, if you do not force it.—*Selecus.* Gentiana Amarella.—*W H J.* It is the spawn of some fungus, but of what species no one can tell. Corrosive sublimate will destroy it.—*R W.* Bifrenaria racemosa.—*Cavanensis.* It is a Fuchsia of some sort.—*Sub.* We cannot undertake to names florists' flowers.‡

NUTS: *Bacca.* It is the Sapucaja nut, the produce of Lecythis Ollaria.

ORANGE TREES: *X Y Z.* Better let them alone till next spring, and remove them the moment the buds begin to swell.

PAINT. We hear good accounts of Carson's anti-corrosion paint, but we believe that painters find it troublesome to apply.

PAXTON'S COTTAGERS' CALENDAR may be had at the Office of this Paper, or of any bookseller, price 3*d.*, or 5*s.* for 25 copies for distribution amongst cottage tenantry.

PINUSES: *G E.* In order to effect the object you have in view, we would advise you to cut off the lowest tier of branches annually, until the stem is cleared to the desired height.‡

POTATOES: *Reader.* The York Regent is a white Potato.‡

ROBERTS' STRAWBERRY TILES: *Fairplay.* Will you enable us to communicate with you through the post confidentially?

ROOT-PRUNING PEACH TREES: *A H Z.* They may be root-pruned now, with the view of making them more fruitful next season, and with a greater chance of success than if the operation was deferred until October; for by cutting the long carroty roots, the growth of the tree will be checked, and the wood will have more time to ripen. The root-pruning of unfruitful trees at Midsummer tends to ripen the wood better, and promotes fruitfulness in a greater degree than if done in autumn. Root-pruning so late as last October, your trees had not a chance of ripening their wood. Open a trench down to the drainage, about 3 feet from the stem of your trees planted in 1846, cutting all the roots with the spade. After the trench is cleared thoroughly out, get down into it, and cut the roots smoothly with a knife, when the soil, if good, may be returned to its place. Curl in spring is caused by green-fly and cold weather. The former may be destroyed by dusting with sulphur or Scotch snuff; and the effect of the latter may be prevented by using a good canvas covering, which can be rolled up by means of lines and pulleys during fine weather, and let down when it is cold. This is better than fixing a thin material over the trees night and day, as is usually done, by which the trees are half blanched for want of light and the action of the sun. Cover well when necessary, and expose fully when the weather is fine.‡

SCARLET GERANIUMS: *E and Georgiana.* They may be wintered in a dry cellar, which is free from frost. With occasional protection the Verbenas may possibly winter safely where they are; but it is all chance-work. If you had wished to preserve them successfully, you should have put in cuttings of them early in autumn.‡

STRAWBERRIES: *Tristan.* Any kind of stone will do. Burrs were employed for no other reason than that they were cheaper than anything else in a district where natural stone is unknown. We do not esteem the Strawberry you name. It is not to be compared with the old Pine, the British Queen, or even Keens' Seedling. You cannot prevent Asparagus running to seed; all you can do is to hand-pick the plants when in flower.

THERMOMETER: *Mold.* We will see what can be done.

THE TREE ROSE: *W D.* At the request of numerous subscribers the price of this work is now reduced from 4*s.* 6*d.* to 3*s.* 6*d.*, post free; it can be forwarded to any address by a Post-office order being sent to James Matthews, at the Office of this Paper.

TOMATO SAUCE: *T B.* To make this, when the Tomatoes are quite ripe cut them in two, press out the pulp, and separate the seeds, then put them into a skillet with some savoury sauce, and a little salt. When of the thickness of Pea-soup, rub it through a coarse cloth, boil it to the consistence of marmalade, put it into jars, and in a day or two after pour over it lard or butter, and tie down with oiled paper. For further information, see p. 653, vol. 1847.‡

VERBENAS: *E C, Kent.* Pink, with a crimson centre and light eye; a nice variety, and well worth cultivating.°

VINERIES: *Senex.* 60° to 64° is not enough for Muscats. You ought to command 75° to 80°. We cannot suppose that the eminent firm you employed would put up a defective apparatus. They might be called upon for an explanation. What your gardener has said is so true that we should imagine him to be a master of his business.

MISC: *M R.* Stowe, Buckingham.—*Rosabella.* We do not know; probably in next year's pocket books.

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE LONDON MANURE COMPANY beg to offer as under:
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
TURKEY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.
The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

GUANO AND OTHER MANURES FOR WHEAT SOWING.—On Sale, Guano (finest Peruvian), Superphosphate of Lime, made from Bone, Bone-dust and half-inch, Dried and Prepared Night-soil, Urate, Gypsum, &c. Also Foreign and English Linseed Cake of the best quality.—Apply to MARK FOTHERGILL, 204 A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.
EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY.
"Do you bruise the Oats you give your horses?" "No."
"Then you lose one bushel out of every three, and your cattle do not half so well."
MARY WEDLAKE AND CO.'S OAT-BRUISING MILLS. Superior Chaff Engines, simple in construction, doing from 50 to 500 bushels daily, and more. Almost all brewers and coachmasters in London use these implements.
118, Fenchurch-street, London. A pamphlet on the above, by sending 12 postage stamps. Chaff-cutters, Linseed, Bean, and Malt Mills.

The Agricultural Gazette.
SATURDAY, SEPTEMBER 14, 1850.

MEETINGS FOR THE FOLLOWING WEEK.
THURSDAY, Sept. 19—Agricultural Imp. Society of Ireland.
THURSDAY, — 26—Agricultural Imp. Society of Ireland.

IT may not be generally known that medals are offered at THE EXHIBITION OF NEXT YEAR for the best sacks of Wheat, Barley, Oats, Rye, Beans, and Peas respectively. Any one who wishes to compete must send a notice of his intention to the nearest local committee connected with the exhibition, during the course of next month, which is the latest period of entry: and from the same source he may obtain instructions for the further steps necessary to be taken. Foreigners will, no doubt, compete for these prizes, and our farmers, we imagine, would not like to hold back. The characters as to weight, quality, and uniformity of sample will determine the merit of the different parcels exhibited, and certainly there are in this country varieties good enough which have been harvested well enough to furnish specimens qualified for a good place in what *may* be made, and no doubt *will* be made, by foreigners, if not by ourselves, a very interesting section of the exhibition.

AT page 426 in our number for July 6 of the present year, there will be found a tabular statement of certain DRAINAGE REPORTS, kindly furnished by correspondents during the year 1847, and published in our volume for 1848. These reports embrace an extent of nearly 4000 acres of land lying in England, Scotland, and Ireland. They include every variety of soil, describing it as "strong clay," "hard clay," "weak clay," "stubborn clay," "heavy clay," "alluvial clay," "clay of various consistencies," "poor white clay," "weald clay," &c.—"strong loam," "red loam," "soft loam," "sandy loam," "light mould," "sandy soil," "gravel and coarse sand," "blowing sand," and "various." They describe cases in which the depths of drains adopted varies from 22 inches to 60, and the intervals between them from 16 feet to 70—in which the acreable cost of the operation varies from 2*l.* 10*s.* to 10*l.* 11*s.*—in which the material has been "bushes," "broken stones," "tiles and soles," "pipe tiles," and "stones over tiles,"—in which the result has varied from "a partial failure" to a "permanent improvement." They furnish, with respect to most of the instances described, the extent and cost of the operation, the nature of the soil, the direction, depth, and material of the drains, the cost of the digging, and the condition of the land before and after the operation. They may thus surely be deemed worthy of study; and we shall endeavour, accordingly, to point out some of the lessons which they appear to teach.

As to the *direction* of the drains, it is worthy of note, that in every instance in which they had been cut "across the slope," the result was unsatisfactory, the operation had "little effect," and was "imperfect"—the land was "not perfectly drained"—"not much improved"—"fallows were still needed on it," and it had to be redrained in the direction of the greatest fall; after which the same reports speak of it as "now perfectly dry"—"worth 30 per cent. more to rent"—"paying the expense of redraining the first year"—and so on. The fact, then, regarding the proper direction of drainage in all lands, not so steep as that a stream of water down it is liable to wear away the trench, seems clear enough; and the advantage of the direct descent appears to be chiefly owing to the immediate passage from the land thus afforded to the drain water, which has no such opportunity as drains cut aslant the slope offer, for percolation from the conduit through the land below it.

On the *depth* of drains these reports do not furnish distinct comparative statements. In the few cases in which a deeper re-drainage was executed, the result—a great improvement—has to be divided between the effect of increased depth and that of an altered direction of drains, so that the portion of merit due to these causes respectively is not easily attainable. Many cases of successful deep drainage, however, are recorded. Thus, in Northamptonshire, strong and stubborn clays were drained 4 feet deep, at intervals of from 30 to 36 feet, with ample success; and we are told that Mr. PARKES' system, formerly condemned in that neighbourhood, is now approved. Again, at Ardingley, in Sussex, 100 acres of weald clay were drained 4 feet deep, at intervals of from 30 to 50 feet, and at a cost of 3*l.* 15*s.* per acre, and the crops of Wheat have been increased by 8 or 10 bushels per acre. On the other hand, we have, in Staffordshire, a case in which "strong loam resting on clay," then in a poverty-stricken state, was drained 22 inches deep, at intervals of 33 to 36 feet, at a cost of from 3*l.* 14*s.* to 4*l.* 5*s.* per acre, and the result "answered all expectation"—better crops of better quality being obtained. And 120 acres of stiff clay in Cheshire appear to have been perfectly drained at a depth of 30 inches—the drains being 18 feet apart. In another case, too, the result of deep drainage on a strong clay appears to have convinced the reporter that it is "wrong in principle." We believe him in this to have arrived at a wrong conclusion, and we recommend him and all others, who may not already have matured their opinions on this subject, to read an article on "Agricultural Drainage," which appeared originally in No. CLXXI. of the "Quarterly Review," and has lately been republished in a separate form.* There is ample experience in favour of very deep drains in very stiff clays, and their success under such circumstances perfectly corresponds with the indications of theory. Water will not filter from land so long as its weight is insufficient to force the power of attraction which holds it there. And thus the depth in every wet soil, where it begins to weep from the sides of a trench, is the point above which there is height enough of water in the land to overcome the capillary attraction which tends to retain it. The depths of this point will obviously be greatest where the capillary force is greatest; and, as this approaches its maximum in the stiffest clays, so these drains must be cut the deepest. That is the theory of the subject as it has been often expounded of late years; and one is surprised that the accident of a puddled surface, which may in any case have hindered for a year or two the efficiency of a deep drain, should have been allowed to interfere with the general adoption of an idea which appears inconsistent with the practice of shallow drainage in stiff clays.

There is a good deal in the reports we are referring to upon the *intervals* between the drains in the several instances described—but no such distinct comparisons are possible from the materials they furnish as would bring out the effect of a greater or less interval under any particular circumstances of soil and depth of drain. We are inclined to think that the nature of the climate has more to do with the correct solution of this question than the nature of the soil; and that the quantity of rain which the field is likely to receive during 24 hours is a more important datum in determining the proper interval of drainage than the per centage of alumina its soil contains. But on this and other points to which our tables refer we cannot now enter—we must be satisfied for the present with having exhibited what they appear to express upon the depth and direction of drains.

* "Agricultural Drainage." JOHN MURRAY, London.

THE SOIL AND THE AIR.

A VILLAGE LECTURE.

(*Concluded from page* 572.)

BUT plants contain ashes as well as wood and water, and these ashes they get from the soil. The mineral parts of a plant, its ashes if it be burnt, are as necessary to its growth as is the wood of which it chiefly consists. A large tree contains a very few pounds of ashes, a heavy Mangold Wurzel a very few grains, and yet without this small quantity of mineral matter neither of them could grow. And it is not every kind of earthy matter that will do, there are particular kinds that it needs, and without which it cannot live. And very often it happens that a soil is barren, just because it does not contain the particular kind of earthy matter that is wanted; and so when that one thing is added it is at once made fertile again.

The ashes of plants contain 11 or 12 of the 60 different kinds of matter which are supposed to exist. They do not all contain the same kinds. Wheat contains, in many respects, a different sort from Turnips, Oats contain a different sort from Clover, and so on. If you were to grow Wheat year after year upon the same ground, and always sell the produce from off the land, the land would very soon cease to be able to grow Wheat; the Wheat would ultimately take out of the soil all that sort of mineral matter which it requires, and when there is no more of that matter there, then that soil will be barren so far as Wheat is concerned; but it may not be barren for other crops, the mineral matter for which may still be present. And you can imagine how, by growing Turnips after Wheat, and Barley after Turnips, and Clover after Barley, and so on, each taking its own sort of matter from the soil, that the period when the soil would be exhausted for *all* these crops, of the mineral matter they respectively require, would be delayed for a very long time. And this is the secret of the advantage of having a rotation of crops; it is as if you had half a dozen people living on the food of one store-room. If they came one after another, and all of them ate only bread, the larder would be very soon exhausted, for the beef and other things there are supposed to be of no use to them; but if the first took bread, and the second beef, and the third bacon, and so on, the larder would keep them living for at least six times as long. Just so with the land: if you have one crop which takes *a*, and another which takes *b*, and a third taking *c*, and a fourth *d*, out of a soil which contains *a* and *b* and *c* and *d*, then if these crops be taken one after another, they will exhaust the land much more slowly than if all the four crops one after another took *a* only, for that would soon be all used up. And when, as we know, the straw of Wheat, and the manure from Turnips, and so on, are returned to the land, it will be a very long time indeed, if *ever*, before the soil, under this good management, will have been exhausted of all mineral food for plants that it contains.

This mineral food for plants does not enter them in grains or as sand, it can only enter them when it is dissolved in water, and thus it goes in by the extremities of the roots. It is known that the sap or juice of plants is a thick viscous sort of fluid, and it is known that that sort of fluid is a very thirsty sort of thing, possessing considerable affinity for water. Well, the little holes at the end of the roots are too small to let this thick viscous fluid out, but not too small to let the water in, and so the desire of the sap to unite with the water can be gratified only by the water passing through these holes into the tree, and thus the process goes on. I have got just such a process going on here in this vessel. I have here some sugar and milk mixed together—a viscous fluid possessing the requisite desire to unite with water, and it is separated from the water by a skin of bladder, the pores of which are large enough to allow water to pass through, but small enough to hinder the milk from passing through, and so the milk pulls the water in, and it rises in the tube. Just so the sap rises in the tree, and pulls in the water out of the soil, which water contains all those mineral substances which the plant requires.

Now for one word on drainage. Fancy a soil full of water, so that any rain which falls on it just rolls over the surface into the next ditch without getting into the land. The water in such a case, by excluding the air, will sour the land; it will convert what would have been good food for plants into poison for them; but even supposing it did not do this, the plants would soon starve. For you must remember that a plant in the soil is just like a man would be who was chained by the leg to one place in the larder. The larder may be full of food, but as soon as the man had eaten all that was within his reach he would starve, though in the midst of plenty; that is, he would do so if there were not some contrivance in operation for carrying the different dishes by him as he stood, so that he might take a bit here and a bit there as they passed, just as he chose. Now, in a well drained soil the rain water is just such a contrivance as this. It dissolves out the mineral part of the soil and carries it by the roots of plants, so that they may take a bit here and a bit there as they choose, and thus they are fed; but if the land be not drained, the water soon fills it, and

then no more rain will sink in and the water is stagnant in the land—there is no current through it—the dishes in this larder are lying still on their shelves, and as soon as the poor plant has eaten up all the food around it (even supposing it is food and not poison), it must starve, for it cannot go about after its food like an animal; it is like an animal chained by the leg; it is stationary, and must die if food is not brought to it. The use of draining is not to get rid of water, it is to make use of water; it is to keep the soil so that rain shall sink through it and feed the plants, not off it and leave them to starve. Abundance of water is a good thing. What is more fertile than a water meadow? but then it must not be stagnant water, which keeps the food for plants away from them, or converts it into poison. It must be water in motion, continually carrying food to the roots of plants, as in a water meadow or in a well drained field it does.

Now, what is this mineral matter which the soil contains, and without which the plant must starve? I cannot go over all the different things it contains. I will refer to only two. Here is one—a piece of one; this thing I have in this bottle is called phosphorus; it was got out of the bone of an ox; all bones contain some of it. Where did the ox get it? It got it out of the Grass it fed on. Where did the Grass get it? It must have got it from the soil. And all fertile soils do contain some of it. It is in its pure or uncombined state, a waxy looking thing of very remarkable properties. It is very easily set on fire, and burns most brilliantly in the oxygen gas, as you see. Now the Grass could not grow, and Turnips could not grow, unless they had some of this to feed upon; and when the soil is exhausted of it, it will be barren for almost all crops. This substance, phosphorus, is an important part of bones, and it is a fortunate thing that almost all plants do require it from the soil, and do contain it in their substance, for otherwise animals could not form their bones by eating those plants as food. Well if your soil does not contain enough of this phosphorus, all you have to do, is to apply a lot of bone-dust, which contains the phosphorus it wants. You know that that is a powerful manure, and almost all its power it owes to this phosphorus. Milk and cheese contain a lot of phosphorus in them. Milk, the food for infants, must contain it, or it would not enable the growth of the bones of the child; or of the young animal that receives this food. Now all the phosphorus in milk or in cheese is taken out of the Grass, and the soil of the farm; and on a dairy farm, no manure has a more fertilising influence than this bone-dust, which restores this phosphorus to the almost exhausted soil. And whereas nothing in the soil is of any use to plants, but what will dissolve in the water which they take up by their roots; and whereas bone-dust dissolves very slowly in rain water, so any means by which you can make the bone-dust dissolve more readily, will greatly increase its effect—will make a small quantity of it, in fact, do for the year what a large quantity would otherwise be required for. And that is the secret of the effect of the oil of vitriol upon bone-dust. Bones and acid, as it is called, or superphosphate as it is sometimes called, is more powerful than common bone-dust, just because it is more easily dissolved in water. A less quantity of the superphosphate will make the Turnips grow as well, because it is more soluble, and the rain water will dissolve as much phosphorus out of a cwt. of it, while the crop is growing, as it would out of many bushels of the simple bone-dust. And now suppose we have got our Turnips, we give one-half of them to a lot of young cattle with growing bones, and the other half to a lot of full grown fattening oxen, whose bones are as large and as heavy as ever they will be. Don't you see that the former, the young beasts, will take all the phosphorus out of their food to make their bones with, while the latter will use hardly any of it; and this is the reason why manure from the former is not nearly so good as manure from the latter. The manure from the full grown fatting oxen contains all the phosphorus of their food to be used over again by another crop of Turnips, and that from our store stock contains none of it, for they need it all to make their bones of; or, in the case of cows, to make their milk of. And thus you see that it is not so much bulk of manure that the farmer wants; that would be of little use, provided the bulk in question did not contain the right things. A ton weight of guano has in it more of the mineral food of plants than 50 tons of poor farm dung; and to talk of a heavy dressing of dung, does not convey any idea of how the soil has really been treated. A heavy dressing of poor dung may not be half so enriching as a very light application of good manure.

But the ashes of plants contain many mineral substances besides phosphorus—they contain sulphur, and lime, and iron, and magnesia, and the earth of flint, and several gases, and soda, and potash. Now I will just refer to one more of them—potassium, the metal of potash. I have some here; this was obtained from the ashes of a plant which got it from the soil. Not a mouthful of bread or of meat you eat but contains some of this substance. It is a soft metal floating on water, and having such a tendency to violent chemical action, that it catches fire and burns as soon as it reaches the surface of the water. This potash and potassium is added whenever you apply wood ashes to the land, and they are a very powerful manure in many cases, and their power as a manure is owing to the potash they contain.

Well, then, we have seen that a plant obtains its combustible part from the air, and its mineral part from the soil—that the mineral part is not the common earth of the soil, but consists of 10 or 11 things in the land, which emit them in comparatively small quantities, and which the farmer must restore as the plants remove them, or the soil will be found to get poorer. We have seen that draining is a contrivance by which the rain-water continually going through the soil to the underground drains, instead of off it to the open ditches, is enabled to feed the roots of plants with the things which it dissolves out of the land. We have seen that these things must be kept in the land by the cultivation and manuring of the farmer, or else the land will lose its fertility. We have seen that plants have no power to change one thing into another—if the things you give them in manure be not the things they require, the manure will be useless, and the plants will be stunted or starve. Strange as it may seem to those who see the manure continually added to the land, and the Wheat continually taken from it, a plant has no power to convert one thing into another. It can but take the atoms or particles you give it. It will flourish if they are food, it will starve if they are withheld, and if they are poison it will die. Take some manure and burn it, you will find that it has ashes; burn some Wheat, too, and you will find that the mineral part of both is alike—that the ashes of the Wheat contain the very same things as those of the manure, and the very atoms you might have added to the land in that manure would have been built up in the Wheat plant. There is no mysterious or necessary connection between a heavy dressing of dung applied to the land and a heavy crop taken from it. It is not the weight, it is the composition of the manure that must be looked to to determine its agricultural value. The crop finds in the manure the very particles which it requires as building material. Draining and good cultivation are the hodmen who bring these building materials to the growing plants. Plants are at once the masons who put them together, and the erection that is in process of completion; and the whole procedure goes on under the eye, and according to the laws, of that great Master Builder who contrived the whole wonderful system of vegetable growth, and confers the life which puts it in exercise. *M. S.*

BOG CULTIVATION.

One part of White Moss, near Middleton, to the extent of nearly 200 acres, has been improved, under the superintendence of Mr. James Dixon, now agent to Robert Gregge Hopwood, Esq., of Hopwood. This part of White Moss has been purchased, or leased, by Messrs. Gould and Jones, at whose expense it has been brought into cultivation. It now carries excellent crops of corn, Clover, and roots, although the climate is far from what is termed good. This Moss lies at an altitude of about 400 feet above the level of the sea. The drainage is perfect, which is not always the case in Moss improvements. The following detail of improvements made upon this Moss is from information furnished by Mr. Dixon himself.

"The whole extent improved is divided into fields of from 6 to 8 acres in extent each. The fields are in the form of parallelograms, not more than 70 yards wide, all joining up to suitable roads formed for the purpose. The fields are divided by the means of large open drains. The first operation in improving was the cutting of these divisions or main drains, 5 feet wide, and from 2 to 3 feet deep, thus providing suitable outlets for the water. Drains were then opened across the fields from one main to another, being cut 20 inches wide, and 24 inches deep. The whole extent intended to be improved as a first undertaking, was gone over in the way herein specified; and by the time that all the cross drains were cut, the mains were in a fit condition for being deepened another foot, but in no case should there be any immoderate haste in performing this work, owing to the pulpy state of the surface. It was found the most judicious method to open the drains at different intervals, getting nearly the depth in one season, and completing or covering up such as were to be under drains the season following. The cross drains were cut to the depth of not less than 4 feet 6 inches when completed, and the mains as much deeper as the condition of the peat would allow.

The main drains, as before observed, were left open, forming a division between each field; cross drains were cut at from 5 to 7 yards distance, laid with sods, and covered up before any attempt was made at further improvement. The mode of cutting these drains was with an implement called a tommy spade. This spade is straight on the shaft, and the operator cuts so that his drain sides are nearly vertical. The surface sod is taken neatly out to the depth of 12 inches, and laid carefully on one side in order to be a covering for the lowermost spit, this being 18 inches deep, and cut with an implement called a spitting tool; after which the surface was introduced on the spit, and formed what is understood by the term wedge and shoulder drain.

After draining, the surface was broken up, partly with the plough and partly with the spade. In ploughing, to prevent sinking, the horses are provided with wood pattens attached to their feet, made firm by light iron plates, and fastened by means of a bolt. As a further preventive against sinking, the horses were not allowed to walk on the ridge, or in the furrow, but on the undisturbed surface. After ploughing, a heavy roller with 8 or 10 circular knives fastened to its cylinder, was drawn with four or five horses over the land. This instrument cuts the tough peat into small pieces. A large harrow was then employed to effect a further reduction. Marling being the next operation, was done by a portable railway, without which, peat bogs of any extent cannot be by any means cultivated to advantage.

The waggons and other machinery required to complete one mile of this sort of railway will cost about 400*l.*, and when laid down on a tolerably level line, one horse will draw upon it from three to four tons. Sand was used in connexion with marl, in the proportion of one of sand to two of marl, and of the two substances about 200 cubic yards were applied to the acre. Night soil and coal ashes have been applied as manure, and found to answer much better than others, not only as immediate help to the crops, but also to reduce and decay the live peat to a soil. To prepare the peat ready for cropping required three ploughings and three harrowings, and twice cutting with the roller; these operations on the average cost about 3*l.* per acre.

In breaking up by the spade, the surface was first turned over with the plough, then spade trenched, with the ploughed furrows laid underneath, as the work proceeded. This operation cost from 4*l.* to 4*l.* 10*s.* per acre. The extra outlay in the cultivation by the spade has been found to be amply repaid in the results of the produce, which have been estimated to be from 10 to 15 per cent. in favour of that implement. The following is an estimate of about the average cost of bringing this Moss into cultivation, excluding the cost of making roads, &c., viz:—

Draining, including mains	£4 0 0
Marling and sanding 200 cubic yards	4 10 0
Manure, night soil, &c., 30 tons	7 10 0
Trenching	4 0 0
	£20 0 0

Some parts of the improved peat were first planted with Potatoes, others sown with Swedish Turnips, common Turnips, and Mangold Wurzel: all in drills. Oats have been produced on the Moss in question, averaging full 60 bushels per acre. Also Turnips from 26 to 32 inches in diameter, and at the rate of about 20 tons per acre."

A railway has been made from the Manchester and Leeds line right on to this Moss, by which manure is conveyed from Oldham and Manchester, and the produce from the Moss to any market. Being situated in a manufacturing district the greatest part of the produce is sold from the land, consisting of hay, corn, straw, and roots, and manure brought in return. Very little stock is kept on the land besides the working horses. The rotation adopted after the Moss is brought into a regular system of cultivation is, 1st Oats, after Clover; 2d Potatoes or other root crops; 3d Wheat, winter or spring varieties according to the time of sowing, which is sometimes in the early spring months; 4th, Clover, cut twice. The detail of the work is as follows:—the Clover root is ploughed one furrow in the spring, and the Oats sown broadcast and harrowed in, and when the new crop is in the second or third leaf, it is rolled.

After harvest the land is ploughed one furrow deep, and left all winter. The spring following it is cross ploughed, then well harrowed and gone over with the cultivator and harrow alternately at intervals, until the soil is well pulverised, and the weed roots picked out and burnt. The land is then drawn out in 27 inch ridges with a double mould board plough. Dung is then cast upon the land and put in heaps of from 1 cwt. to 1½ cwt. in each, the heaps being put about 6 yards asunder in every third drill. It is then spread equally in the furrows and the ridges, reversed with the double mould board plough. The mode of management is the same whether for Potatoes, Turnips, or Mangold Wurzel, only the Potato sets are laid on the dung before covering up, and the Turnip and Beet seed are sown above it after it is covered, the ridges being rolled before and after sowing. Mangold Wurzel is sown early in April, afterwards Potatoes are planted in that month, and also in May. Swedish Turnips are sown from the middle of May to the middle of June. Different varieties of the common Turnip are sown (as soon as time and circumstances will allow), on the remainder of the fallowed land; of course that land on which those crops are sown the latest, receives extra scarifyings and harrowings before sowing.

All these root crops are gone over with the drill cultivator or horse hoes, during the growth of the crop, and the plants thinned and kept clean by hand hoeing and weeding. Potato sets are laid from 9 to 12 inches asunder in the drill, and the best Turnip plants left at about 12 inches. As these crops are removed from the land in the autumn or winter, the land is ploughed one furrow if the weather suits, the Wheat seed also being sown broadcast and harrowed in. In April following the crop is rolled, then red Clover and Rye Grass sown, and the land bush harrowed and rolled again. After the Wheat is harvested, a top dressing of night soil and ashes is given as soon as the land and weather will permit, or of guano or soot in the spring following. The quantity of seed Oats sown per acre is about 5 bushels, and of Wheat, 2½ bushels. *Rothwell's Agriculture of Lancashire.*

THE POTATO HARVEST.

Allow me to point out to the agriculturist what has long appeared to me a general and serious neglect in gathering in that most important vegetable the Potato. I have observed for years in my travels through the different counties of England, in my professional pursuits, a general tardiness in securing the Potato crops at a proper season; and as that season is already at hand, the suggestions I have to offer will perhaps now

be most opportune and serviceable. It is generally but erroneously supposed that the Potato is not ready until the top appears completely decayed or withered up; whereas, it is unquestionably ready as soon as the functions of the stem and leaves have ceased to act: the tuber then derives no further nourishment, and can be no better for lying in the ground; consequently as soon as the Potato tops become exhausted—that is, have lost their vigorous greenness, and are evidently turning to a languishing yellow, the tuber has reached the height of its growth, and can derive no additional good by remaining longer in the ground, and should therefore be got up the first favourable opportunity in fine weather and stored away in as clean and dry a state as possible. Many crops will be found ready in the early part of September, and by the end the whole ought to be got in. Instead of this, hundreds of acres every season remain ungathered at the end of October, and many in November, the natural consequences of which neglect are deterioration in quality, and inevitable loss in quantity, many being seriously damaged by the heavy autumnal rains or by frost, both as they lie in the ground and in the process of taking up. It is gratifying however to know that although the Potato disease prevails to some extent in all parts of the country, yet its prevalence is far less than it has been for some years past; therefore, if strict attention be paid to the getting in of the crops we may confidently expect a fair average supply of good healthy Potatoes, which have long been not only scarce and dear, but very deficient in quality. The improvement in the health of the Potato this year is variously accounted for; by some it is attributed to a proper supply of rain, which has been pretty general, and which has kept the plant in a state of regular growth throughout the season; great transition of drought and wet promoting the disease.

On a visit to a friend on the west side of Sheffield, a month ago, I learnt from the gardener that the crops of Potatoes were for the most part scarcely diseased. On my enquiring into the state of the weather in that neighbourhood, it appeared the ground had been very dry, that then heavy rains succeeded, and, the ground having a clayey bottom, the wet lodged too much about the roots. About 3 miles from the former place, on the opposite side of the same town, where the soil was of a loose nature and free from clay, the disease had not made its appearance. The gardener was of opinion that there had been sufficient rain in that locality to keep the plant in a proper and healthy state of growth.

At a third place, which I visited a fortnight ago, in a fine neighbourhood near Doncaster, the crops in the garden were quite free from disease; and, upon asking the gardener what kind of manure he had used, his reply was, None, but that the ground was in good condition, having had a copious supply of manure the previous year; the produce was certainly clean and beautiful. The proprietor, a close observer, informed me that his field Potatoes, which were planted in March, were equally good; but he showed me a small field belonging to a farmer, and separated from his own vegetable garden only by a road, in which the whole crop was so much diseased as to be almost useless. My friend attributed the failure to two causes which he had told the farmer at the time of planting would be prejudicial to the crop, viz., late planting and copious manuring on the top of the sets with fresh stable manure. They were planted at the end of May, and grew vigorously until the end of July, when the disease took them, and the tops at the time I am speaking of were completely black and withered. My own crops planted at the end of April cannot be said to be entirely free from disease, but so nearly so that my men in taking up a plot of upwards of 300 square yards say they have not found more than 2 lbs. weight of diseased Potatoes in the whole. The Prince Regents are scarcely ready, but promise to be a fine crop, and are equally free from disease. They were all planted at the same time. Previous to planting, all the ground was trenched over two spades deep. The soil is of a loose kind nature. We laid on the top a moderate quantity of quick-lime, then mixed it well and regularly amongst the soil, then a trench was thrown out about 3 inches deep with a spade, and a small quantity of well-decayed stable manure was spread all over the bottom; the set was placed on the top, and lastly the trench filled in to its original level. I may add that spent Hops have been used to some of our crops, which answer admirably, and better perhaps than any other tillage. We have also found crops succeed well in fine coal ashes, the trench being half filled with them and quick-lime employed as above. I believe ashes to be invaluable for strong land. I do think it of importance to plant in good time in the spring, say from the middle of March to the middle or not later than the end of April. Late planted crops are more liable to the disease than early planted ones, as they are growing vigorously towards the end of summer, when it is considered the disease does the most mischief.

I think there is no advantage in planting much sooner than the first named period. The tops are in great danger of being cut off by early spring frosts and the crop seriously injured; besides, early planting affords all the more time. It is moreover of the utmost importance that plenty of room be allowed between the rows, so as to admit a free circulation of air as well as the sun's rays, both of which are essential for driving off stagnant and impure damps, which lodge amongst the crowded tops. Two feet from row to row for such as have moderate tops, and 3 feet for strong spreading kinds, are the proper distances. *Joshua Major, Knosthorpe, near Leeds, Sept.* 3.

P.S. We ought not to be alarmed by the black and withered appearance that the Potato tops present just now in almost every locality, as this is to be attributed more to the late high winds than to the effects of the Potato disease.

RAPE CAKE FOR SHEEP.

Finding that in consequence of my remarks at the discussion after the council dinner of the Yorkshire Agricultural Society at Thirsk, my relation, Mr. Charnock, of Holmefield House, had written, without my knowledge, to Mr. Milburn, the secretary of the society, confirming what I said on that occasion, I should be greatly obliged to you to allow that letter—a copy of which, with Mr. Charnock's permission, I send herewith—a place in your next impression, or in as early a number as you can find space for it. It is a subject which is creating great interest amongst the agricultural portion of your readers, and as Mr. Charnock has explained very fully his plan of operations, its publication will render the greater practical service. I would further beg permission to add that so far from the sheep not eating rape cake, Mr. C. has at this time 50 of his draft ewes that are daily eating their ordinary ration of rape cake alone, without any linseed cake. *J. H. Charnock.*

"*Holmefield House, near Ferrybridge, Aug.* 12, 1850.

"My dear Sir—Seeing that my relative, Mr. J. H. Charnock, has been speaking at your meeting, at Thirsk, of my mode of feeding sheep principally on rape cake, and that some doubts were expressed as to whether the animals could be induced to eat rape cake, I hasten to furnish you with the particulars of my system, the results of which, in the shape of fat hogs, you last spring did me the honour to praise. I first commence teaching my ewes to eat rape cake at lambing time, but from their now having had it the previous season they eat it readily. At lambing time the ewes have free access every night to troughs, in which is crushed rape cake, placed in the lambing fold. As they lamb and go to pasture, the rape cake is continued through the summer, at the rate of half a pound each ewe per day. At weaning time, about the middle of July, I take the ewes from the lambs, giving to the latter, on their old pasture, as much cake as they will eat in the proportion of one-third rape cake to two-thirds linseed cake; this proportion is continued until I remove them on the second crop of Clover, when I alter the cake to one-third linseed and two-thirds rape, which is continued through the winter, giving to each sheep ½ lb. of cake per day on Turnips, and always cutting the Turnips from the commencement. In this way I find no difficulty in getting my flock to eat rape cake, if of good quality; for there are certainly some samples of rape cake no animal can be persuaded to eat; such as have been heated on shipboard, or in the warehouse, or have become fusty from being stowed in a damp room, or on a damp floor. I also find sheep prefer foreign to English-made rape cake. But sweet good rape cake is not only readily eaten by sheep, but experience has proved to me that it is a most healthy food for them. Since I began to use it liberally my flock has been much more healthy, and the deaths have decreased to a very small per centage annually. The amount of deaths in my ewe flock from October 1, 1849, to July 8, 1850, was barely 1½ per cent., and in my hog flock from July 1, 1849, the time of weaning, to the date of their going to market, fat, and clipped, was scarcely 1½ per cent. This small number of deaths does not arise from anything peculiarly favourable in the season, nor in the plan of giving cake, for some very good sheep farmers who reside near me, and who give their sheep quite as much cake per head annually as I do (but all linseed) were comparing notes with me the other day on the advantage of using rape cake as part of the food of young sheep; and they admitted their loss of lambs, both at weaning time and when first put on to Turnips last year was very considerable, whilst I did not lose one lamb at either of these times. The principal cause of death in my hogs was apoplexy, from high feeding; but I find a regular supply of salt does much to check that disease. One great claim rape cake has to the attention of the sheep breeder is that not only does it check scouring, but it seems a complete preventative to that most fatal disease amongst newly-weaned lambs. Perhaps if given with too much dry food it might confine the bowels of sheep too much, but when given with succulent food it seems peculiarly adapted to prevent too great laxity.

The reason I first tried rape cake for sheep was from seeing the great good which green rape did to young sheep; and considering that the seed of a plant contained the very essence of that plant concentrated, I determined to try the effect of rape cake, more especially as I had seen it given to a certain extent to cattle in the Netherlands. Economy has caused me to persevere in it, as I find it by far the cheapest food I ever met with for sheep; and when given to sheep on Turnips the succeeding crop of Barley is better than if the same value in Oats, Peas, or Beans had been given to them. I gave from 4 to 6 lbs. of rape cake each per day to 30 young heifers in my straw fold last winter; they eat it readily and did very well upon it, with a small supply of cut Turnips. I first persuaded my ewes to eat rape cake by sprinkling a little salt upon it; there is one thing, however, which is almost needless to mention to you, that much of the success attending the feeding of sheep on cake depends on the shepherd's care, attention, and cleanliness; the troughs should be cleaned out daily, and the appointed time of feeding should be strictly and punctually kept. The cake troughs should be so made as to keep the rain from the cake. Before I conclude allow me to say that the plan of giving cake to my sheep all through the year is part of my system (on very light and naturally poor land) to manure directly for every crop; and I find passing highly nutritious food through the stomachs of animals to be the easiest mode of applying manure, and at a time, and to a purpose, when most needed. The young sheep, as a growing animal, is a great robber of your soils, especially of phosphoric acid. It ought therefore to have it supplied in the food you give it; and you cannot more readily, or at a less cost, do this than by giving rape cake, which contains more phosphoric acid than linseed cake. The ashes of rape (green) are particularly rich in phosphoric acid, containing nearly 20 per cent. Excuse this rough and somewhat hurried letter. I have no ends to serve; but if I can bring a cheap food under the notice and use of the agricultural world, I shall be satisfied, only you may rely upon my not riding my hobby further than is profitable. I should certainly not have troubled you with this had it not been for the recent discussion at Thirsk. *Charles Charnock.*"

Home Correspondence.

Evening Schools for Adults.—The following remarks, made at the establishment of an evening school in an agricultural district, sufficiently indicate the plan proposed, which I happen to know was successfully carried out during the past winter. *M. S.*

"Now, as to the management and guidance of the affair—that, of course, so soon as it is fairly at work, will be matter for the consideration of the subscribers themselves; for it is much to be desired that people should not talk of joining it for a mon h and then leaving it, as if it were a thing apart from themselves; they should think of it as their own and of themselves, as joining together for mutual benefit in establishing it. The future government of the room, then, will rest with the subscribers themselves, who will no doubt choose a committee from among themselves to determine future arrangements, but as it is necessary to have rules made to begin with, and a system arranged before subscribers join, I beg to propose that the following 7 (intelligent farmers and working men), who, I dare say, will join as subscribers to the room, should be a committee, to arrange the details of its management to begin with. As regards the support of the room and of the evening school, the following at the present time are our means. We shall have, I fully expect, a least 30 subscribers; that will yield 15*s.* a month. We have succeeded in obtaining promises from kind friends, who will give us gratuitous lectures at monthly intervals during the winter. From these six lectures I expect we shall receive as admission money at least 30*s.* a month; add 5*s.* a month as the quarterly sixpences of the evening school, and we have 50*s.* a month, or 15*l.* in the six months, as what we may call our educational fund. Out of this, the cost of lighting and warming this room four nights in the week will be at least 2*l.*; that of lighting and warming the school-room three nights in the week for the school will be 30*s.*. 8*l.* or 9*l.* will be spent in books and maps and newspapers ordered for the reading room, and then about 4*l.* will be left towards the support of the evening school—that will cost about 6*l.* or 7*l.*; but the difference will I have no doubt be made up by subscriptions for the purpose. These then are the prospects we entertain of support. To those who propose joining us, I may now as well say what are the means with which we at present start. The following is a list of books which we already have in our library, many of them containing engravings and other illustrations of the subjects they treat of. Some of these I have taken the responsibility of ordering on account of the library; others are presents from friends: Lives of Eminent Englishmen, with Portraits, 16 vols.; China and the Chinese, 3 vols.; History of British Commerce, 3 vols.; Literature and Learning in England, 2 vols.; The Englishwoman in Egypt, 2 vols.; British Chemical Manufacture, 1 vol.; Life of Wm. Caxton, 1 vol.; Dialogues on Instinct, 1 vol.; Mind among the Spindles, 1 vol.; The Elephant, 1 vol.; Pinnock's English History, 1 vol.; Donaldson on Manures, Grasses, and Farming; Lawson's Agriculturist's Manual; Main's Farmer's Manual; Smith's Productive Farming; The Farmer's Medical Dictionary; Stewart's Stable Economy; Wiggins on Under-draining. We have also in smaller volumes, Cleeve's Book of Inventions; several volumes on different branches of natural history; on the Thunderstorm; Natural Phenomena; History of the Plague; Winter in the Arctic Regions; Short Memoirs of Eminent Men; Narrative of Shipwrecks. We have also the following newspapers: The Express daily paper, one local paper, the Mark Lane Express, the Gardeners' Chronicle, Bell's Weekly Messenger, the Economist, the Irish Industrial Advocate, the Midland Counties Herald, the Scottish Farmer, the Illustrated London News, and the Pictorial Times. And I believe that in weekly or monthly periodicals of interest to us as farmers, or interesting as containing the public news and current literature of the day, our room will be well furnished. This will be in some measure out of the funds subscribed by the members themselves, but chiefly by the kindness of friends—for we would not be altogether independent. We are very glad to be under obligations to others for assistance of this kind; indeed, so long as we have this roof over our heads we cannot be independent, and I am sure none of us wish to lose that feeling of gratitude which all of us entertain for the generous munificence which has erected so admirable a school-room for our village. In addition to the library and newspapers, subscribers will have free access to the monthly lectures, for which 3*d.* and 6*d.* are charged to others; they will also, if any one should prefer it, be able to attend the evening school on such nights of the week as they fix upon. There are no doubt some young men among us who will think they ought to attend the school rather than the reading room; if they subscribe to the latter they will be able to attend both. I would just say a few words in conclusion on the principle of this movement. You may depend upon it that all of us need relaxation and entertainment for the mind. I believe this is just as much a necessary of life as bread and water are necessaries of life. You may depend upon it that *we will have it too*, whatever our station in life may be; and unless we either join together or are assisted to obtain it from instructive and useful sources, it will be looked for and found in useless or mischievous sources. And I submit to you that *a great mistake* is committed by those who are anxious to benefit their neighbours, by those who are anxious to spread what benefits they have themselves received; if they confine themselves to relieving the body or offering dry instruction in school to the mind. Why do they leave all the *pleasures* of life, which are by far the most attractive to the young, and to those whom we are especially anxious to have as friends and assistants, in the hands of the *enemy;* for so it is when a young man looks around him on a summer or a winter's evening after his day's work, and finds nothing better than the skittle-ground or the card-table to go to—games which

might, perhaps, be harmless, but which NEVER HAVE BEEN HARMLESS YET, because they are made the occasion by the men in whose hands they are of commencing and confirming those habits of drinking which are, I firmly believe, one of the deepest curses under which this country labours. I am sure that the pleasures of interesting and instructive reading, of listening to illustrated lectures on interesting subjects, and so on, are as superior to those which any public-house has to offer as light is superior to darkness; and I hope that our friends who may be interested in this matter, but who may not be able to join us as members of our society, will yet assist us as far as they can to make this room as interesting and attractive as possible. Books, and money to buy books, are what we want. In what I have said, however, on the subject of useful amusements for the purpose of displacing those which are mischievous, I wish to be understood as addressing only those of our friends who are interested in this subject, and I have not been speaking *to* young men when I have been speaking *of* them. If I had to address those young men themselves who may hitherto have frequented public-houses and card-tables for want of anything better to engage their leisure hours, I would speak in a very different style from this. I would, indeed, ask them to join us here, and assure them they will find far more satisfactory amusement and enjoyment with us; but I would confidently warn them that whether better places are open for them or not, it really is at their peril they continue as hitherto, where they can *do* nothing but mischief, where they can *receive* nothing but mischief, and where it is simple truth to say that hundreds and thousands have continued before them till they have come to wish that they had never been born."

Clover Failure.—I venture to suggest the trial of an experiment on Clover cultivated under two distinct conditions. You may test the results upon such as is grown together with Barley in the usual way, and also upon such as is grown in the unusual way, free from the disadvantageous influence to which it must of necessity be subjected under the ordinary treatment it experiences in an agricultural routine. If you turn to the *Agricultural Gazette* of 1844, page 529, you will find some remarks I made upon the subject of Clover failure, after a short and imperfect view I had just been taking of this question. I then asked for an experiment, and I have continually asked for it ever since, of a very simple description, which I consider necessary as a preliminary step for acquiring a datum on which an argument may be safely raised as to whether Clover failures are not essentially and primarily to be ascribed to the condition under which the seed is grown. If some 50 or 60 farmers will back a research on this subject by merely leaving a single stetch without Barley when they sow their Clover next year, it is most probable that two more years will not have elapsed before we shall have ascertained whether a failure in other parts of a field extends to the stetch on which no Barley has been sown. If it should turn out that it does not extend to that ridge, we may fairly say that the presence of the Barley has had something to do with the failure elsewhere, and that I need not repeat what I have already suggested. I may however add to what has been said before, that I am now inclined to think the condition of the seed when raised from crops cultivated in the usual manner may have less to do with the evil than I had supposed at first might possibly be the case; still, I would not withdraw the suggestion already given, of testing this point also with direct experiment; such parts as have come under my own observation within the last few years have tended to confirm me in the notion I had formed of the necessity of treating the inquiry rather with reference to physiological than purely chemical consideration. I have heard farmers say they cannot afford to lose the Barley for the sake of keeping the Clover healthy, and they immediately arrive at the conclusion that the experiment I have suggested would be useless. But I need not tell you that even if the Barley turn out to be the primary cause of these failures, there would be no need of entirely abandoning its culture in order to secure the Clover. Let us understand the merits and demerits of the case, and then your chemical experiments may furnish data for so far modifying present practice as shall enable the farmers to raise their invalid crops of Clover over the difficulties to which they have subjected them. I have observed several suggestions and conjectures about Clover failures and the remedy for them, of later years; but I have only heard of a single instance of a direct experiment having been made of the time to which I refer, and in that case there were no failures in any part of the crop, so that no satisfactory result could be obtained. If it had been thought worth while to try this experiment in every county of England at the time it was suggested, I cannot doubt that we should long since have had an opportunity of knowing whether the cause of Clover failures is rather to be sought for in physiological or chemical consideration. I have no idea that suggestions about Orobanche, Cuscuta, and others to which I could refer, are at all likely to throw light on the present question of Clover failure. *J. S. H.*

Dairy Stock.—I think you will find great errors in your "dairy stock account," published at page 556, especially in the article of milk sold; in 1833 I find the price of butter sold was 13*d.* per lb., and the milk 1½*d.* per quart; in 1837 the butter was sold at 15*d.* per lb., and the milk 7*d.* per quart; in 1840 the butter sold at 15*d.*, but the milk at 3*s.* per quart! This of course will materially alter the amount of produce sold per cow per annum; it was the large amount each cow netted that called my attention to the particulars. I should, however, very much like to see a fair statement of the real average value of a cow per annum, and many other of your readers, I have no doubt. *Buffer.* [You forget that part of the milk only was sold in the *new*, otherwise where did the butter come from? and that the quantity of milk given is only that of the *new* milk sold. The result, however, is extraordinary enough to suggest doubts of its accuracy, and we should be glad if Mr. Rothwell would re-examine it.]

Farmers' Clubs.

LONDON FARMERS' CLUB, *June 3.*—"*Upon High Farming, showing how and to what extent capital can be applied to a given quantity of land to ensure the greatest amount of profit.*"

Mr. BAKER, of Writtle, said: I consider, in pursuing this investigation, as set down for this evening, that my object will be best secured and more effectually obtained by taking up the question as a farmer's question, and in examining its various bearings, to consider it as an occupation carried on for the sole object of remuneration and profit, and to treat each investment as made with reference entirely to that object. In fact I shall consider the land in its twofold character: first, as to the investment made by the landlord, by which the largest return by way of rent can be produced; and secondly, by the tenant, as a business carried on, which, by his application of capital and skill, may be made to realise the largest possible annual return. I will presume, therefore, that the land having been thoroughly drained and cultivated, and the investment made, that we are in fair progress to realisation; but it must not be expected that such result can be made in the first year; it will take at least four years before high farming can begin to repay; the land must participate in the general benefit to arise from extra cultivation and manuring for at least that period; but if the land had previously been under a worse than an ordinary state of cultivation, it will require at least seven years before it may be said to be fully established. The main features to be attended to are, the producing a large amount of green crops for consumption by cattle and sheep, to make such application of inorganic substances to the soil as may be necessary to insure success—in fact, by the addition of lime, chalk, clay, silica, &c., as may be necessary for the general amelioration of the soil; to apply the manure produced upon the farm with the utmost economy and care, keeping in mind always that two light dressings will at different periods produce a greater return than one heavy one for all grain crops, whilst to green crops it will be necessary to apply manure more bountifully, as no damage will ensue by producing them as fine and at the same time abundantly in quantity as possibly may be effected; and as regards the application of guano, it will be found most advantageous to apply it to the production of root and other green crops in preference to grain crops, reserving the farmyard manure as much as possible for the latter. And it may be worth while here to observe that by a series of experiments communicated to me by a most intelligent cultivator, as well as derived from other sources, it has been found that more than 2 cwt. of Peruvian guano applied to each statute acre of Wheat or Barley did not repay the cost of the application, as it was found, in numerous experiments, that as the quantity became increased, the result diminished the quantity of grain, although it would have been considered otherwise, as the straw was materially increased, and by increasing the quantity to 4 cwt. per acre, there was no increase whatever in the grain from where no application took place. With Grass it was otherwise, and with root crops also; an increase in quantity upon the former produced a greatly increased amount of Grass, until the evil was apparent in the opposite direction by the weakness produced in the stems being such as to cause the crops to become lodged, whilst with root crops 4 cwt. or even 5 cwt. can be used if applied with skill, but 3 cwt. appears to be the quantity that may be used with the greatest advantage; and in every experiment made by myself, when not drilled, I have found the better plan to sow it and cover with a shallow ploughing a few days previous to ploughing for the depositing the seed; by such process, even in dry weather, we need not fear losing the guano by evaporation, as on its being covered in, the ammonia becomes at once fixed and therefore not liable to escape. The making and management of manure, next to draining, is the most essential operation towards the improvement of the farm. Much diversity of opinion at the present time exists as to the mode in which it should be carried out. One class, and that a very limited one, contends for the system of lodging the cattle upon latticed floors, so that the manure may escape through the interstices and be collected below. In that case I think the means as hitherto resorted to are not complete; the flooring below the latticed floor should consist of an inclined plane, from the front to the back of the building, and should be first laid with concrete and covered with asphalte, and when the moderate cost at which this can be effected is estimated against the advantage to be derived, it will be at once apparent; every portion of the manure and urine of the animals will be thereby saved and easily conveyed to receptacles behind, for mixing with ashes, burnt earth, or other substances; the opening will also allow the man attending the cattle to easily clean away manure, or even wash down the floor in the best manner. The detail of application afterwards I shall not enter into, having never practised the system, and until I am convinced more of its utility than I am at present, I fear I never shall, except so far as mere experiment may lead me. I have not come to this conclusion without sufficient reason for so doing, and I am quite satisfied that upon corn farms the better mode of making manure is to use all the inferior straw for litter, and for the purpose of absorbing the animal fæces; we thereby have it in the most convenient state for application to the soil, and thus return the ingredients that have entered into the formation of the straw to the soil. The system next introduced is that of confining the cattle separately in covered sheds, called boxes, the floors of which are sunk several feet below the surface in each division; in these places, about 10 feet by 8 feet, the animals are kept for several months together, fresh litter being added daily; the accumulated manure thus made is found to be highly concentrated, no other moisture having been admitted but such as is deposited by the animal, and it is doubtless one of the best modes of producing manure. But it is objectionable on some accounts, for young animals especially, whose growth is better insured by having liberty of action, and having a constant supply of fresh air, and it has been found injurious to them if afterwards subjected to the changes of atmosphere that follow upon exposure; therefore for all breeding stock it is highly objectionable, and, as a system, can only be made applicable to fattening cattle, or for cattle designed from the commencement for fattening; besides, upon a farm where a mixed description of cattle is kept, the extent of covered building required would be greater than landlords are disposed to erect, and it is a question still unsettled whether the advantage to be gained is equivalent to the annual sum that would as a per centage be chargeable upon such a system of management. Another, and certainly, in my estimation, a more beneficial mode, is by covered yards, in which a number of cattle may be kept for rearing or fattening purposes. No rain-water should be allowed by this process to fall upon the manure in the yards, and in fact the result is the same as in the box-feeding system, the only difference being that the cattle have liberty of moving about over the whole extent of the yards; but judging from observation, the manure thus produced is better than I have seen under any other system. The Rev. Mr. Cooke, of Semer, in Suffolk, has perhaps more fully succeeded than any other person in carrying out this system; his yards are well aranged, and the buildings judiciously constructed, and, as models, may be viewed with advantage by any one desirous of adopting this certainly most excellent system. The common and almost universal practice in this kingdom is to keep the store and breeding stock in open yards, and to stall the oxen under covered buildings, the manure from which is, or ought to be, daily spread over the yards, to be trodden in by the stock moving at large; but it unfortunately happens in most cases that the rain-water falling upon the building descends into the yard, and flows through the manure exposed to its action, and thus a very large proportion of its valuable quality is lost, and too frequently is seen stagnating in the open ditches, or running to waste in various directions; but this may be materially obviated, and perhaps sufficiently upon corn-growing farms, by having the eaves of the buildings supplied with cast-iron or zinc troughing, and thus convey away the water by underground drains. If this process is well carried out, none of the valuable properties of the manure need be lost, for if no part of the deposits of the cattle are allowed to escape, every portion must be retained, not in so highly a concentrated state, but sufficiently so for all useful purposes. As the object of this discussion is to ascertain the best mode of producing manure as one of the essential points to insure success, I have been the more minute in describing the various processes resorted to, and must leave every one, under the various circumstances of place and convenience, to adopt that mode which can be most readily applied; the result will be pretty much the same if every portion of the deposits of the cattle is made available. The application will nevertheless be the same, provided the respective farms are of similar character; but as I presume that in every occupation more or less green crops are annually produced, the intention should always be to secure the largest possible quantity of the manuring properties that those crops will produce by feeding with cattle and sheep, and it has been found that the sooner the application of manure is made to the land after removal from the sheds or yards the greater the effect, and, therefore, it should never be allowed to enter into active fermentation if it can be avoided; but as a difficulty arises frequently to prevent that object being carried out, then it should be carted out and consolidated as far as possible, by drawing the loads of manure upon the heaps, and after the sides are trimmed, then to cart upon the heaps as much fresh earth as will keep the whole mass in as compact and solid a state as possible; and a few days only previous to application, to fork it over for the purpose of mixing, and as soon as it has arrived at a state of fermentation to cart it upon the land, and plough it in as quickly as possible. It is true that a small portion of the gases thus generated by fermentation will escape; but, on the other hand, the manure will become far more portable, and will eventually give a better result, than if turned in in quite an undecomposed state. I have practised both modes, and have found in dry seasons that the application of raw manure is frequently injurious to the crops, from keeping the land open and porous, and therefore rendering it liable to be affected by drought. The chief application of the manure should be for the production of the green crops or such other crops as precede the Wheat crop; the latter will generally succeed better after a crop of Beans, Peas, Clover, or Turnips have intervened between the Wheat crop and the manure than when the application is made direct for the Wheat. Farms now said to be high-farmed must be considered as having external aid by the assistance of guano or other portable manures, purchased for producing the Turnip or root crops; it is more suitable to their growth than for corn crops, as experience proves; and by a liberal application of it, nearly or even the whole of the farm-yard manure may be spared for grain crops. The horses, and indeed every description of stock, should be foddered in yards during the summer as well as in the winter, and it would be better that each horse have a division to himself, or only four horses be kept in each yard. All the green food should be cut into chaff, first using about one-third of green to two of dry food, increasing the quantity until the proportion is reversed, or the dry food superseded altogether. The detail, as pursued by myself, I will give in a letter that I drew up at the request of a gentleman, and which process I am now pursuing, having, from the middle of April last in the current year, foddered all my horses and most of my neat stock upon that system. Whatever mode is pursued, it is important that a dressing of at least 10 or 12 yards of manure should be raised for every acre of arable land yearly; and I assert that, under proper management it may be accomplished. In addition to the green crops thus consumed, every portion of hay, to be cut also into chaff, should come into use upon the farm during the year, and as much also of the green crops as can be applied with advantage: but I am doubtful if cattle, sheep, or pigs can be fed upon grain with any profitable result, except so far as they contribute to the quantity of manure raised upon the farm. A bushel of Barley or Peas has always been considered as equivalent to the production of a stone of 8lbs. of meat; therefore if the price of the meat is less per stone than the grain per bushel, the difference is a loss, and *vice versa*. Upon the judicious application of manure much of the success of the cultivator depends. By an application of it too liberally, as much injury may ensue to grain crops as by doling it out too sparingly; and therefore, practically speaking, the judgment of the cultivator will be manifested to the casual observer by the even character of the crops produced over the whole farm, and not, as is too frequently found on the side of public roads, that the fields, from having been more highly manured, have crops luxuriating in rank vegetation, whilst those fields not under observation, and at a distance from the homestall, have crops of a starved character and appearance, contrasting themselves like the fat and lean ears in Pharoah's dream. The successful application of manure should, as far as possible, be at once to cart it on and cover it in speedily with the plough, especially for green crops; but in autumn it frequently happens that large masses have to be moved for the coming crops of Wheat and Beans, and then it is absolutely necessary that the dressings be completed during the continuance of weather suitable and as expeditiously as possible. I may, I fear, be exceeding the ordinary limits of the discussions by dilating to such an extent upon these essentials of high cultivation, viz., the producing of manure, and by its application yearly increasing the general character of the soil and progressive advancement of the condition and power of the farm to maintain itself in the highest possible state—produce crops, by judicious management, to make the largest return with the greatest amount of profit. Another most important point is, how best to effect that object by the system of cultivation to be pursued, and I must therefore presume that the farm is sufficiently stocked with active horses at all times to carry out an expeditious system of converting the land to the production of the forthcoming crop, immediately upon the present one being removed; for unless such is the case, it will be impossible to realise the largest available product that the farm will give if its ability is not taxed to the utmost. It will, therefore, be necessary at all times, and through all seasons, that the number of horses be sufficient, especially during the summer months. As soon as any crop is removed, the more speedily the land can be ploughed the better, not only as a means of keeping down weeds, but also by keeping the land in good tilth, and available for the production of the forthcoming crop. This system, pursued for a series of years upon the same land, will almost eradicate weeds, and the hoeing of the crops will thereby be comparatively reduced to a modicum of what originally was the case. It may perhaps save time if I show the particular cultivation of one field as it has taken place during a series of years, as better exemplifying the system pursued, than by dealing generally with the question. The land referred to is of a light or gravelly character, with a subsoil of sandy loam and strong loam and clay alternately, with a fair depth of staple, originally of a poor character, producing the wild Radish, known as white Charlock, Corn Marygold, Mayweed, and a species of Vetch called Tare-tyne, which on the lighter portions of the land used to grow up with the Wheat and grain crops to such an extent as to be out of the power of the hoe to eradicate without partially destroying the crops

with them. By an application of chalk clay in quantities varying from 60 to 120 tons per acre, all those pests have disappeared, and by that process and thorough drainage alone, the produce has been doubled; until this operation was effected (and which it took several years to complete) the application of manure was of little avail except in the production of green crops, for which the land was always well calculated. The cultivation during 12 years was as follows:

	Cultivation.					Manure.				Crops.
	Ploughing.	Scarifying.	Harrows.	Drillings.	Rollings.	Manure.	Clay and Chalk.	Guano.	Soot.	
						Tons.			Bush.

	29	13	47	12	18	80	60	4	70	

The foregoing has been indiscriminately selected, and the statement not in any case exceeding the actual number of operations. This put into comparison with some of the statements that have lately appeared, especially that one of Mr. Huxtable, showing how Wheat can be produced by one ploughing and a few pounds of ammonia, if not disproving others, at least exhibits a system practically applied for a series of years without regard to public exposure, and which, if it has no other recommendation, at least involves a large amount of labour, and exceeding that stated by Mr. Mechi as his maximum, viz., 40*s.* per acre. It would have facilitated this investigation had I been able to have given the quantities produced in each year, but this I am unable to do. The average, I presume, of Wheat to have been about 4 qrs.; of Barley, 6 qrs.; Oats, 7 qrs.; Clover-hay, from 3½ to 4 tons; Swede Turnips about 20 tons; of Rye, cut green, 10 tons. The Pea crop was a deficient crop, all the green crops productive. The expenditure for the period will stand thus:—

Cost of Manure per Acre.

80 loads manure, about one moiety carted from town, 5*s.*		£20	0 0
40 loads chalk clay, 1*s.* carting, 2*s.* 6*d.*		7	0 0

It therefore appears by this comparison, which has been drawn up without regard to the result, that the profit upon a large investment in farming is about the same proportionately with the smaller investment. Under the high farming the average expenditure would be 10*l.* 5*s.* per acre; the return, with Wheat at 56*s.* including profit, 13*l.* 3*s.* 2*d.*; with Wheat at 40*s.*, 8*l.* 19*s.* per acre, showing a loss of 9*s.* 3*d.* per acre. Under the ordinary system of cultivation, of manuring the land once in four years and taking one crop of Wheat, one of Barley, one of Clover, and one green crop, the result would be, with Wheat at 56*s.*, a return of 8*l.* 0*s.* 3*d.* per acre, with Wheat at 40*s.*, 5*l.* 10*s.* 7*d.*; the expenditure 6*l.* 10*s.* 9*d.* per acre. So that either under high farming or fair average farming, although the annual expenditure may be increased 50 per cent., still the crops under the same reduction will not yield any profit, but show a positive loss. It has in cases similar to the one now under discussion been of late the fashion to compare high or very good farming with very bad farming; but as good farming is now the rule, and not the exception in the present day, it is unfair to make such deductions. If Wheat and grain cannot be produced at a profit under ordinary circumstances of low expenditure, and regular ordinary practical application, then how can it be produced at increased expenditure with greater profit? The subject viewed dispassionately is an anomaly if otherwise construed; I am nevertheless an advocate for producing the utmost possible quantity from each and every acre under cultivation, but I hesitate advising others to act up to that principle, until they shall be satisfied that prices will be sufficiently high to become remunerative; and it has been not only my opinion, but that of all practical men who have followed farming as a business, that by a proper alternation of crops and a steady and consistent system, more corn can be produced than by adopting the system of growing Wheat in succession on the same land, or even more frequently than the intervention of ameliorating crops will allow, within a very short period. Wheat was and is still the grain by which the farmer meets his chief payments, and this he does without any consideration whether it produces him more or less than other crops: he still endeavours to obtain as much Wheat per annum as possibly can be obtained, when it might have been that other crops would have paid him as well or better. I should be one of the last to disparage the attempts of others, however feeble, in pursuit of agriculture, having through a long life exerted myself in effecting that object by applying the utmost practical skill and knowledge I was possessed of, combined with such science as I have been able to obtain, to effect it; but I confess I have of late been startled at the assertions put forth by certain persons that, in proportion as prices diminish, exertions and outlay of capital should increase. As in trade so it is in farming; whenever profits become reduced, it is wise to limit transactions, and when losses occur to reduce them still further. None but gamblers pursue their object with increased energy as the risk becomes greater.

Miscellaneous.

On the Nutrition of Plants. By Prof. Magnus.—Prof. Magnus has instituted a series of experiments upon the vegetation of Barley. The Barley was subjected essentially to the same treatment as that adopted by the Prince of Salm Horstmar; in the analyses, the results of all those experiments which have been made in recent times have been applied. The author preferred this method of determining the constituents necessary for the growth of the Barley to that of the mere ash analyses, for the reason, that although the latter enable us to ascertain what inorganic constituents occur in a plant, they do not give us any further information as to whether they are all requisite for it. If the latter were the case, the ashes of the same species of plant ought always to exhibit the same composition, whilst in fact rather considerable deviations occur. This evidently depends upon the circumstance, that sometimes more, sometimes less of the alkalies and earths contained in the soil enter the juices of the plants, according as they exist in a more or less soluble state, as Saussure has already shown by his experiments. On drying the plants, the mineral constituents contained in the juice, which are thus as it were accidental ingredients, are left, and are subsequently met with in the ash. Hence this sometimes amounts to more, sometimes to less; and contains sometimes more of one, sometimes more of another inorganic substance, according as this has been applied to it from the soil. Hence it is possible that certain substances, which are by no means essential to the existence of a plant, may constantly be met with in its ash. We might imagine, *e. g.* that the lime or magnesia which occur in all manures, and are therefore met with in all ashes, are still by no means indispensably requisite for some plants. We must therefore enter upon a synthetical method, in addition to the analytical one which has hitherto been adopted. With this view Prof. Magnus placed grains of Barley in pure carbonised sugar in a series of experiments; various salts were then added to this; and in another series of experiments, the same seeds were placed in pure felspar. The carbon was obtained from pure white sugar-candy, which was fused in a large porcelain dish, and heated until it formed a hard mass; this was then taken from it, and thoroughly heated to redness in a well-closed porcelain crucible. To be certain that the carbon contained no mineral constituents, 2 grms. of it were burnt upon silver foil in oxygen gas. They left a mere trace of residue, which weighed much less than half a milligramme, hence less than $\frac{1}{4000}$ of the weight of the carbon. Eight different experiments were made with this carbon. In one, it was used without any addition; in the second, all the mineral matters existing in the plants were mixed with it, and in the following quantities:

	per cent. of the weight of the carbon.
Carbonate of lime	4.0
Protocarbonate of manganese	0.5
Carbonate of magnesia	2.0
Peroxide of iron	1.0
Sulphate of lime	1.0
Phosphate of lime	2.0
Chloride of sodium	0.5
Chloride of potassium	0.5
Silicate of potash (soluble glass)	4.0
	15.5

In the third, all these salts, with the exception of the silicate of potash, were added to the carbon, being most intimately mixed with it, as in all the following experiments; the silicic acid was therefore absent. In the fourth, the chloride of sodium was omitted instead of the former; sodium was therefore absent. In the fifth, the phosphate of lime was omitted; phosphoric acid was therefore wanting. In the sixth, the sulphate of lime; hence there was no sulphuric acid. In the seventh, the protocarbonate of manganese; and to be certain that the peroxide of iron used in this experiment was perfectly free from manganese, it had been precipitated by succinate of ammonia; hence there was no manganese present. In the eighth, the chloride of potassium and the silicate of potash were omitted; and instead of them, 1.5 per cent. of finely-powdered and elutriated rock-crystal were added; here potash was therefore absent. In each of these experiments, three different vessels were used; in each of them a grain of Barley was placed, so that each experiment was performed three times. The vessels were made of zinc, coated with a thick layer of rosin and wax. Their diameter at the top was 1.75, at the bottom 0.5 inch, and they were 5 inches in height. To avoid the variations of temperature, which readily occur in such small vessels, there were always 12 of them fitted into the lid of a wooden box containing sand, so that the zinc vessels were perfectly surrounded with sand. These boxes were placed in a front window of a room facing the south. By opening small panes, the air could be sufficiently renewed. Although the deposition of dust could not be entirely avoided in this way, yet it was as little as possible in experiments of this kind. As often as the carbon got dry, it was moistened with distilled water; and to restore the deficient nitrogen to the plants, water containing one-thousandth of its weight of carbonate of ammonia was added, a quantity which is imperceptible to the tongue. In those vessels which contained carbon without any addition, the plants attained a height of 5 inches. In the others they were either stunted or undeveloped. As in the latter an effervescence of a white salt almost invariably appeared upon the surface of the carbon, this gave rise to the supposition that the carbon might have contained too large a quantity of soluble salts. To remove these, the plants were taken out of the carbon, and then each of the seven mixtures mentioned above, with which the experiments 2 to 8 inclusive had been made, were exhausted with water. Three new vessels were then filled with each of them, and two grains of Barley placed in each vessel. The plants then developed were unequally strong, and in some of these mixtures they even attained a height of 14 inches, whilst those in the vessels containing the pure carbon became developed to a height of 5 inches only. Hence it is evident that the presence of even a small quantity of salts is injurious to vegetation. At first, salts to the amount of 15.5 per cent. of the weight of the carbon were added; of these, however, the chloride of sodium

and chloride of potassium were the only soluble ones, and these together do not form more than 1 per cent., and very small quantities only of difficultly-soluble salts, as sulphate of lime, were present. Scarcely any development then took place; but after the greater portion of these had been removed by exhaustion with water, the plants grew better, although, even after this treatment, the quantity of the remaining salts appeared still too great. The experiment however showed decidedly that Barley cannot be developed without some mineral matter, but dies after having attained a height of 5 inches; whilst, when a small quantity of salts is added, vegetation proceeds much further. How far it would be possible, however, so to mix the small quantities of the various salts with the carbon, that they may be uniformly distributed, and that perfect development of the plants be attained, can only be decided by subsequent investigations. *Monatsbericht der Akedemie der Wissensch.*, zu Berlin, Feb. 1850, pp. 60-71. *Chemical Gazette.* (*To be continued.*)

A Comparison of Farmers.—The great bulk of the Lancashire farmers are bad accountants; indeed, a large number of them keep no accounts whatever; and their profits and losses are only judged of by the weights of their purses at the end of the year. This is certainly a very true criterion, but it gives a man no knowledge of the true cause either of his losses or his profits; it is thus that farmers in general are not aware of the great difference in the amount of the clear available marketable produce from a farm highly cultivated. To show this, in a clear point of view, I have taken the average amount of produce of three farms in this parish. The number of acres under arable cultivation on each farm is the average number for five years, 1834, 1835, 1836, 1837, and 1838, in which I valued the tithes of this parish. The amount of the produce of each farm is also the average amount of those five years. The Clover, Potatoes, and Turnip crops I did not value; of course the weight of these I have estimated by my own experience, but without having the power to test the accuracy of the estimate. I am well acquainted with the soil and the cultivation of every farm in the parish, and, in every case where I have tested my valuation of the crops, I have invariably found that I had rather over-valued the crops of the bad farmer, and under-valued those of the good one. This will show that the following statement will be rather against the highly cultivated farm, and in favour of the badly cultivated one; and from my own experience in farming, I believe this will nearly always be the case in estimating the value of crops. No. 1 is a farm under very good cultivation, No. 2 is a farm in an average state of cultivation for this county, and No. 3 is very badly cultivated; No. 2 is by far the best land, No. 3 is a better soil than No. 1, but is more difficult to manage. The result of the practice on these three farms is, that the tenant on No. 1 began the world with little money, little learning, except the knowledge of labour; has had a little farm, has punctually paid the highest rent per acre, and is now independent of his farm. No. 2 had sufficient capital to begin business, had a good common education given him, has had a large farm of good soil, and at a very reasonable rent, always conducted himself respectably, and perhaps has saved some money, but I have my doubts whether much or not. The tenant of No. 3, with a good sized farm, of very fair soil, and at a fair rent, is now about on his "last legs." He had sufficient capital, but no education.

			Gross Value per acre per annum of disposable produce				2 2 0

From the clear annual value per acre, in all the cases, there are the rent, rates, the manure purchased, and the wages to pay. I have taken no account whatever of the meadow and pasture land on these farms; but the produce from these portions of each farm will be about in the same proportion as upon the arable part. In short, on the farm No. 1, there are as many milch cows kept as upon No. 3, on which is three times the extent of Grass land; and I have no doubt but each cow on No. 1 will give one-third more milk and butter than those on No. 3. Nos. 1 and 2 are very suitable soils for Potatoes and Turnips, and, in South Lancashire, have an advantage in this respect over No. 3. But No. 3 could be made to produce heavier crops of Wheat, Oats, Beans, and Clover, with less manure than No. 1. The produce of No. 2 would be doubled by the same management as is applied to No. 1. In South Lancashire there is a market for every description of farm produce, which is not the case in every part of North Lancashire; but carry out the same style of cultivation in a purely grain or Grass-growing district, and the result will be the same. Everyone will be aware of the great difference in the expense per acre in the cultivation of No. 1, to that of No. 3; and thus the tenant of No. 1 confers a double benefit on the country by the extra money he expends on labour, manure, implements, &c., besides the greater amount of produce to dispose of to supply the wants of the people. But notwithstanding his greater outlay, he will have a heavier balance in his purse at the end of the year. Rent, lays, and taxes are the same, whether the cultivation be good or bad. *Rothwell's Agriculture of Lancashire.*

Calendar of Operations.

SEPTEMBER.

East Lincolnshire Farm, *September* 8.—We last week finished cutting Oats and Barley, and commenced leading Wheat. Of the latter, we cannot this year give a very favourable report; it is small, and in some districts mildewed, particularly in the Fens. The Barley is not amiss, but our best crop this year is Oats: these were grown after Turnips fed off with sheep well caked, and there are probably 10 qrs. to the acre. We mow, as I suppose you are aware, everything here; women and boys following each gang of men, raking and tying. They are getting 7*s.* per acre. Turnips look well on the farm, though not equally so elsewhere. The late fine dry weather, so favourable for harvesting, has for the present retarded their growth, and made Grass keep very bare; so that after getting in harvest, rain will be acceptable. We shall this fall sell off our breeding ewes and buy in an equal number of lambs, to go on Turnips with our own, intending to work a dry flock, which will, we think, answer best here. *H. E.*

Markets.

COVENT GARDEN, Sept. 14.

Vegetables are abundantly supplied. Hothouse Grapes and Pine-apples are plentiful; Peaches and Nectarines from the open walls abundant. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent. Filberts are plentiful and good. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are good and cheap. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are scarcer. Cut Flowers consist of Heaths, Pelargoniums, Carnations, Picotees, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosiasima, Japan Lilies, and Roses.

Smithfield, Monday, Sept. 9.

The supply of Beasts is large, but choice qualities scarce, consequently 3*s.* 8*d.* is obtained for many of them; other descriptions are lower. Several remain unsold. The number of Sheep is small; trade is more cheerful, and a few are sold dearer. The best Calves are dearer, being scarce. From Holland and Germany there are 960 Beasts, 3310 Sheep, and 153 Calves; from Scotland, 30 Beasts; and 2500 from the northern and midland counties.

Per st. of 8 lbs.—	s d	s d	Per st. of 8 lbs.—	s d	s d

Beasts, 4740; Sheep and Lambs, 28,560; Calves, 252; Pigs, 235.

Friday, Sept. 13.

The supply of Beasts far exceeds the demand; the average quality is inferior, the choicest are therefore pretty freely disposed of; trade is very bad for all other kinds. The number of Sheep is for the time of year large. Lower prices are taken, and several remain unsold. We are again abundantly supplied with Calves; the best descriptions are lower, and inferior ones are with difficulty disposed of at a very low price. From Germany and Holland there are 348 Beasts, 1740 Sheep, 235 Calves, and 10 Pigs; from Norfolk and Suffolk, 40 Beasts; from Leicester and Lincoln, 350; and 72 Milch Cows from the home counties.

MARK LANE.

Monday, Sept. 9.—There was a fair supply of English Wheat this morning from Essex, Kent, and Suffolk, which was cleared by the millers on fully the terms of this day se'nnight. Foreign was held firmly at last week's prices, but sales were limited.—Barley of all kinds is 1*s.* per qr. dearer.—The late value of Beans is fully maintained.—Peas must be written 2*s.* per qr. higher.—The sale of Oats is less lively than last week, and prices are unaltered.—The supply of Mustard Seed was somewhat less than last Monday, and disposed of on the same terms.

Friday, Sept. 13.—There has been a fair arrival of English and foreign Wheat this week, and good of foreign Oats, but moderate of other descriptions of corn. The attendance at market this morning was small, but holders insist on extreme prices for Wheat and spring corn of all kinds; our quotations are therefore unaltered.—There is a fair sale for Flour at late rates.—Floating cargoes of Galatz Maize are held at 28*s.*—The weather during the last week has been fine, and favourable for finishing the harvest, which is now everywhere about concluded throughout Great Britain, and the result, according to the best information we have been enabled to obtain, will show the Wheat crop to be below an average, Peas and Beans very bad, Barley and Oats moderate. Prices of all grain have been well supported, with rather an upward tendency, excepting for Oats. Considerable business has again been transacted in floating cargoes of Wheat, chiefly Polish Odessa, for Ireland, at 39*s.* to 40*s.* per quarter.

Liverpool, Friday, Sept. 6.—The weather this week has been exceedingly favourable for harvest work, which is fast approaching to conclusion. Complaints of the yield of the new crop of Wheat are prevalent, but they have not exercised any influence on the price of any article of the trade. At this morning's market the business in Wheat was moderate, but it included two or three purchases for shipment to Ireland, at Tuesday's prices. Sack Flour maintained late value, but American barrels were rather easier to buy. Oats and Oatmeal were without change. Grinding Barley, Beans, and Peas were each in active request, and brought extreme rates. Indian Corn is held with much firmness, and 28*s.* per 480 lbs. is the value of the best American yellow.—Tuesday, Sept. 10.—There was a fair attendance of town and country millers at our Corn Exchange this morning. There was not a large business done in Wheat and Flour, but extreme prices were obtained for both articles. Oats and Oatmeal were not plentiful, and fully late terms were paid for those also. Egyptian Beans advanced 6*d.*, and grinding Peas 1*s.* per qr., with a ready sale.

Now ready, price 10s. 6d. each,

OF THE

IPSWICH MUSEUM.

DRAWN ON STONE BY T. H. MAGUIRE, Esq.

Published for George Ransome, F.L.S., Hon. Sec., to whom all orders must be sent.

DEDICATED, WITH PERMISSION, TO HER MAJESTY THE QUEEN and PRINCE ALBERT.

Ipswich Museum, 1849.

In presenting Portraits of several of the Honorary Members of the Ipswich Museum to the friends of its supporters, a brief explanation should be added of the motives which led to their publication. This Institution was established, in December 1847, mainly with the object of contributing towards the free instruction of the Working Classes in the science of Natural History, by providing for them a good Museum, Library, Lectures, and Classes. The object was no sooner known than the most cordial and generous offers of co-operation were made by many eminent naturalists, whose promises have been amply fulfilled, as opportunities have been afforded them.

Under a grateful sense of their disinterested kindness, I have been induced to present to our Members the Portraits of Gentlemen to whom we feel largely indebted for the prosperity which has attended the progress of the Ipswich Museum, at the same time I have hoped to confer upon them the only tribute of gratitude which it was in my power to offer, for the services and assistance they have rendered us—either by their interesting Lectures, or by their valuable donations to the Museum and Library. It was originally intended to have confined the issue of these Prints to the Members of the Museum, but so many applications for copies have been made by the friends of those whose Portraits have been taken, that I have obtained permission to issue a *limited* number of large India Proofs at 10*s.* 6*d.* each. They have accordingly been reserved for this purpose, and an early applications requested. Any profit that may arise from the disposal of these will be devoted exclusively to the funds of the Institution.

George Ransome.

The following are now ready:

Charles Lucien Bonaparte, Prince of Canino, Author of '*Fauna Italica*,' '*Continuation of Wilson's American Ornithology*,' &c.

Sir J. P. Boileau, Bart., F.R.S., &c. &c.

James Scott Bowerbank, F.R.S., L.S. and G.S., Author of '*Fossil Frutts and Seeds*,' &c.

The Most Noble the Marquis of Bristol, F.R.S., Patron of the Ipswich Museum.

Very Rev. William Buckland, D.D., F.R.S., L.S., and G.S., Corr. Mem. Inst. Fr., and Vice-President of the Ipswich Museum, Professor of Geology, Oxford, Dean of Westminster, Author of '*Reliquiæ Diluvianæ*' '*Bridgewater Treatise*,' &c. (From a Daguerreotype by Claudet.)

Edward Forster, F.R.S., F.L.S., Author of 'On *Vicia angustifolia*' in Linn. Trans.

John Gould, F.R.S. and L.S., Author of '*Birds of Europe*,' '*Birds of Australia*,' &c.

Rev. J. S. Henslow, M.A., F.L.S. and G.S., Professor of Botany, Camb., Vice-President of the Ipswich Museum, Author of '*Principles of Descriptive and Physiological Botany*,' &c., &c.

Sir William Jardine, Bart., F.R.S.E., and L.S., &c., Vice-President of the Ipswich Museum, Author of '*The Naturalist's Library*,' '*Contributions to Ornithology*,' &c.

Rev. William Kirby, M.A., F.R.S., L.S. and G.S., late Pres. of the Ipswich Museum, Author of '*An Introduction to Entomology*,' '*Bridgewater Treatise*,' &c.

John Lee, LL.D., F.R.A.S., Author of '*Antiquarian Researches in the Ionian Islands*,' and Founder of the Hartwell Observatory.

John Lindley, Ph.D., F.R.S. and L.S. &c., Professor of Botany in University College, London; Author of '*The Vegetable Kingdom*,' '*The Theory of Horticulture*.' &c.

Sir Roderick Impey Murchison, M.A., F.R.S. and L.S., V.P.G.S., Hon. Mem. R.S. Ed. and R.I.A., M.Imp.Ac.Sc. St. Petersb., Corr. Mem. Inst. Fr., R. Ac. Ber., Tur. &c., Author of '*The Silurian System*,' '*The Geology of Russia and the Ural Mountains, Alps, Appenines, and Carpathians*,' &c., &c.

The Lord Bishop of Norwich, D.D., F.R.S., late President L.S. and F.G.S., Patron of the Ipswich Museum.

Robert Patterson, V.P. Nat. Hist. and Phil. Soc. Belfast, Author of '*First Steps to Zoology*,' '*Zoology for Schools*,' &c.

Lovell Reeve, F.L.S., Author of '*Conchologia Systematica*,' '*Conchologia Iconica*,' &c.

Prideaux John Selby, F.L.S. and G.S., M.W.S., Author of '*British Ornithology*,' '*British Forest Trees*,' &c.

Rev. Edwin Sidney, M.A., Author of '*Blights of the Wheat and their Remedies*,' and '*Electricity, its Phenomena, Laws, &c.*'

William Spence, F.R.S. and L.S., V.P. Ent. Soc., Vice-President of the Ipswich Museum, Author of '*An Introduction to Entomology*,' &c.

William Thompson, President Nat. Hist. and Phil. Soc. Belfast, Author of '*The Natural History of Ireland*,' &c.

Nathaniel Wallich, M.D., F.R.S.L. and E., F.L.S. and G.S., Author of '*Plantæ Asiaticæ Rariores*,' &c.

William Yarrell, V.P.L.S. and Z.S., Vice-President of the Ipswich Museum, Author of '*History of British Birds*,' '*History of British Fishes*,' &c.

The following gentlemen have also consented to their Portraits being added to the Series:—Professor D. T. Ansted, F.R.S.; Professor T. Bell, Sec. R.S.; W. B. Carpenter, M.D., F.R.S.; J. Curtis, F.L.S.; C. Darwin, F.R.S; Professor E. Forbes, F.R.S; Professor Owen, LL.D., F.R.S.; the Rev. Professor Sedgwick, F.R.S.; Sir C. Lyell, F.R.S.; Sir W. J. Hooker, F.R.S.

Price 3*d.*, or 5*s.* for 25 copies for distribution amongst Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, James Matthews, at the Office of the *Gardeners' Chronicle*.

ENGINEERING SCHOOL CLASS-BOOKS.

In crown 8vo, 4*s.* 6*d.* bound, with 220 Diagrams engraved for the Work,

EUCLID'S ELEMENTS OF PLANE GEOMETRY;

with Explanatory Appendix and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction.

By W. D. Cooley, A.B., Author of the "History of Maritime and Inland Discovery," "The Negro-land of the Arabs," &c.

"The editor has done all that could be done to make Euclid easy to beginners."—*Cambridge Chronicle.*

"Mr. Cooley seems almost to wish to contradict his own motto, that 'there is no royal road to Geometry,' for following in the steps of Playfair, he has considerably diminished both the volume of the work as well as the labour of the student. Prefixed to the Elements are some remarks on the study of mathematics, as valuable for the elegance of their style as for the correctness of their reasoning."—*Civil Engineer and Architect's Journal.*

"This is the best edition of the Elements which has yet appeared."—*Athenæum*—"which, for brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Magazine.*

"Will be found of considerable value as an aid to teachers of the Mathematics."—*New Monthly Magazine.*

Uniform with the 'Elements,' price 3*s.* 6*d.*

COOLEY'S GEOMETRICAL PROPOSITIONS

DEMONSTRATED; or, a Supplement to Euclid: being a KEY to the Exercises appended to the 'Elements,' for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the First Six Books of Euclid, are illustrated in it by new Diagrams.

Whittaker and Co., London.

Handsomely bound in cloth, with 92 Wood Engravings, Price 6*s.* 6*d.*,

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY,

from the Monuments of Egypt. By W. C. Taylor, LL.D.

From the British Magazine.—"This is an elegant and well executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly 300 texts of Scripture are more or less explained in this elegantly executed volume, and in a manner equally curious and interesting."

Price 5*s.* 6*d.*, cloth,

THE HISTORY OF THE UNITED STATES OF AMERICA.

By John Frost, of Philadelphia.

Price 7*s.* 6*d.*, cloth,

THE HISTORY OF FRANCE, from the Earliest Period.

By Emile de Bonnechose. The two volumes of the French edition comprised in the one of the translation. This work is the history approved of by the Minister of Public Education in France, where it has already passed through five editions. London: D. Bogue, 86, Fleet-street.

Stephenson and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

Burbidge and Healy's COOKING APPARATUS, combining Sylvester's Patents.—This cooking apparatus possesses greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus. B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. May be seen in daily use at the Craven Hotel, Craven-street, Strand; Stevens' Hotel, Bond-street; Greenwich Hospital; University College Hospital; and is in use by upwards of 200 private families, and at the Manufactory, 130, Fleet-street, London. A prospectus can be forwarded upon application, detailing particulars and price.

THE MOST SERIOUS CASES OF DROPSY CURED BY HOLLOWAY'S PILLS.—The causes of Dropsy are various, but it generally arises from an obstruction to the free circulation of the blood through the system; to remedy this, there is nothing so effective as Holloway's Pills, as they purify the Blood, and strengthen the Constitution, and thereby gradually diminish the Collected Fluid, and if persevered in till the Cure is complete, it is prevented from accumulating again. Many persons that have suffered from Dropsy can testify to the efficacy of this Medicine, especially Females at the turn of life, who at that period are more particularly predisposed to this invidious disease.—Sold by all Druggists, and at Professor Holloway's Establishment, 244, Strand, London.

FAMILIAR ASTRONOMY.—By George Darley, A.B., 12mo, with Engravings, 5*s.* cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its editor, Mr. Darley."—*Sun.*

Lately published,

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas, as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

A SYSTEM OF POPULAR ALGEBRA, with a Section on Propositions and Progressions. By George Darley, A. B. Third Edition. 4*s.* 6*d.*

A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical; with Popular Treatises on Logarithms, and the application of Algebra to Geometry. By George Darley, A. B. Second Edition. 3*s.* 6*d.*, cloth.

A SYSTEM OF POPULAR GEOMETRY; containing in a few lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By George Darley, A.B. 5th Edition. 4*s.* 6*d.* cloth.

COMPANION TO THE POPULAR GEOMETRY; in which the Elements of Abstract Science are familiarized, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. By George Darley, A. B. Second Edition. 4*s.* 6*d.* cloth.

Taylor, Walton, and Maberly, Booksellers and Publishers to University College, 28, Upper Gower-street, and 27, Ivy-lane, Paternoster-row, London.

BOTANICAL WORKS BY PROFESSOR LINDLEY.

Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth,

INTRODUCTION TO BOTANY.

By Professor Lindley, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.

London: Longman, Brown, Green, and Longmans.

THE ELEMENTS OF BOTANY, Structural, Physiological, and Medical. With a Sketch of the Artificial Methods of Classification, and a Glossary of Technical Terms. Price 12*s.* cloth.

The Glossary may be had separately, price 5*s.*

This will complete the series of Elementary Botanical Works by Professor Lindley, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

CONTENTS.

Part I.—Chap. 1. General Attributes—2. Of the Elementary Organs—3. Of the Epidermis and its Processes—4. Of the Compound Organs—5. Of the Root—6. Of the Stem—7. Of the Leaf-Buds—8. Of the Leaves—9. Of Food and Secretions—10. Of the Motions of Fluids—11. Of the Flower-Bud—12. Of the Inflorescence—13. Of the Floral Envelopes—14. Of the Male Organs—15. Of the Disk—16. Of the Female Organs—17. Of the Receptacle or Torus—18. Of the Ovule—19. Of Fertilisation—20. Of the Fruit—21. Of the Seed—22. Of Germination—23. Of Flowerless Plants.

Part II.—Chap. 1. Linnæan Sexual System—2. Analytical Method—3. The Manner of Studying.—Glossary.

*** The Elements of Medical and Economical Botany, illustrated with numerous diagrams and woodcuts, is now ready.

SCHOOL BOTANY; or, the Rudiments of Botanical Science. New Edition. 400 Illustrations. Price 5*s.* 6*d.*

London: Bradbury and Evans, 11, Bouverie-street.

QUEEN'S COLLEGE, CORK.

SCHOOLS OF ENGINEERING AND AGRICULTURE.

THE SESSION for 1850-51 will commence on the 15th of OCTOBER.

Prospectuses, with details of the several Courses of Lectures in connection with these Schools, the Fees payable, &c., may be obtained by application to the Registrar, or to the Professor of Engineering or Agriculture.

Boarding Houses, licensed by the President, have been established in Cork, where Students are received and comfortably provided for on moderate terms, and their religious and moral conduct watched over by the Deans of Residences.

By order of the President,

Sept. 14. FRANCIS ALBANI, Registrar.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

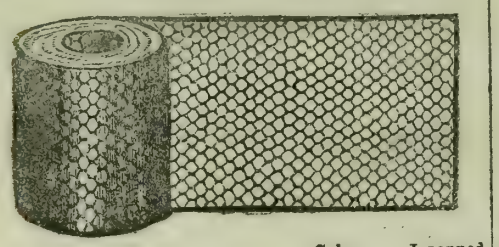
It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S



Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

GALVANISED WIRE GAME NETTING.— *7d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

AYLESBURY DUCKS (White).—The Advertiser has for Sale a limited number of the above, in fine healthy birds, of this season; the breed is warranted pure and of the largest known, weighing, when fattened, 8 lbs. to 10 lbs. each. Price, including package, 8*s.* 6*d.* per couple.—Orders, accompanied by Post-office orders or reference, addressed to ISAAC BRUNNING, North-end, Great Yarmouth, will receive prompt attention.—September 14.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	½ in.	⅝ in.	¾ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d.*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*

3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

VERSAILLES, FRANCE.

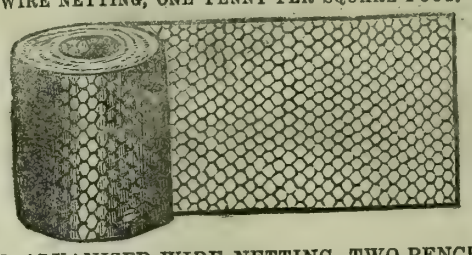
TO BE SOLD, through the Agency of Mr. BERNARD, NOTARY, at Versailles, near Paris, a splendid HORTICULTURAL ESTABLISHMENT, specially applied to the cultivation of Camellias, situate at Versailles, Rue de Beauveau, No. 1, and now occupied by Messrs Souchet and Son, successors to Mr. Margat, jun., on THURSDAY, 26th September, at noon. This Sale consists of the Goodwill, the right to the Lease of the said Premises, Beds, Plants, &c.; Utensils, Tools, and Materials; the whole of the Greenhouses, Galleries to the number of 16, the stands of four of which are of stone, 61,000 double Camellias in cases and pots in the open mould; 53,000 single Camellias, of which 205 parent plants are in open mould, the surplus in pots; 746 Rhododendron arboreums, and 1815 Azalea indicas; in the whole a choice and diversified collection. Together with the materials of a Hothouse, and two large Galleries, easily made serviceable. The Lease has 15 years unexpired, and the rental 64*l.* per annum; valued at 1600*l.* Facilities are afforded for payment.—May be viewed on application, and for particulars apply to Mr. BERNARD, Notary at Versailles, rue Sartory, No. 17, who holds the inventory; Mr. REMOND, Lawyer at Versailles, rue Hoche, No. 18, present at the sale; to Mr. BALIGAND, at the Tribunal of Commerce, of Versailles, Avenue de St. Cloud, No. 26, Assignee to the Creditors of the Bankruptcy of Messrs. Souchet and Sons, pursuing the sale.

TO BE SOLD, A SMALL GREENHOUSE, 10 feet square, with hot-water apparatus complete. For particulars apply to Mr. WM. WRIGHT, Carpenter and Builder, Acre-lane, Clapham, Surrey.

TO BE DISPOSED OF, A NURSERY AND SEED BUSINESS, situate in the neighbourhood of Croydon; about Seven Acres of Nursery, with five Greenhouses, three ranges of Pits, and good Dwelling House. The Nursery is well Stocked with a general collection of Trees, Shrubs, &c. To be taken at a valuation.—Apply to R. C., at Messrs. NOBLE, COOPER, and BOLTON'S, Seed Merchants, 152, Fleet-street, London.

SAWBRIDGEWORTH, HERTS.

TO BE LET, a convenient brick-built RESIDENCE, adjoining the Nursery, with Dining and Drawing Rooms, two Kitchens, and four Bed-rooms, Cow-house, and Stable; with or without a small Pasture adjoining. Rent 30*l.* to 35*l.* per annum.—Apply to Mr. BURTON, Builder, Sawbridgeworth, Herts.



FARM WANTED IMMEDIATELY IN WILTS OR DORSET.

MR. HURLEY is instructed to obtain immediately A GOOD TURNIP-LAND FARM, OF 350 OR 400 ACRES, with a good Farm-house and Buildings, in either of the above counties.—Full particulars to be sent to the Agricultural Agency Offices, 62, Nelson-square, Blackfriars-road, London.—Sept. 14.

SOUTH DEVON.—DELIGHTFUL RESIDENCE, WITH LAND, TO BE SOLD OR LET IMMEDIATELY.

MR. HURLEY is instructed to dispose of a beautiful ESTATE in Devon, having a superior RESIDENCE, situate near the Market Town of Bideford (which will be the terminus of the Taw Vale Railway), 38 miles from Exeter, and close to the Church; is very picturesque, a south aspect, well sheltered, diversified Scenery, excellent Walled Garden, Greenhouse, and 27 acres of Land in a ring fence, in the highest state of cultivation. A Trout Stream runs through the property, which is two miles only from the sea, running at spring tides up to the gates. Price 2000 guineas. Rent 90*l.*—For plans and to treat, apply to the Auctioneer (enclosing two stamps), 62, Nelson-square, Blackfriars-road London.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.* per yard.		30 inches wide	7½*d.* per yard.	
18 "	" 4½*d.* "		36 "	" 9*d.* "	
14 "	" 6*d.* "		48 "	" 1*s.* "	

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

DALSTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions by Mr. J. SMITH to submit to an unreserved Sale by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, Sept. 23, and two following days, at 11 o'clock each day, in consequence of the Lease being nearly expired, the whole of the valuable GREENHOUSE PLANTS, comprising several thousands of choice DOUBLE CAMELLIAS, from 18 inches to 10 feet, beautifully furnished with bloom buds, Azalea indica, Epacris, Ericas, Daphne indica, Pimelea, Corræa, Cassia, Corymbosa, Erythrina, Diosma, Nerium, Plumbago, Kennedya, Chorozema, Gardenias, Geraniums, Chrysanthemums, Cactuses, Fuchsias, Myrtles, Acacias, Heliotropes, Aloes (sorts), Hydrangeas, China Roses, Statice, Magnolia grandiflora (ex), Viola arborea, Calceolarias, Verbenas, Lobelias, &c.—May be viewed and Catalogues had (6*d.* each, returnable to purchasers), one week prior to the Sale; of the principal seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.
SPECIMEN GREENHOUSE PLANTS, &c., THE PROPERTY OF AN AMATEUR.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton (one mile from Hyde Park-corner), on THURSDAY, September 19, 1850, at 1 o'clock, a large assortment of GREENHOUSE PLANTS, including some fine specimens of Ficus, Dracæna, Passiflora in fine varieties, Begonia, Plumbago, Achimenes, Tecoma, Erica, Azalea, Epacris, Corræa, Bignonia; also a large plant of Rhododendron Altaclarence, Nerium, Evergreens in pots, 150 Strong Fuchsias in varieties, 3 one-light boxes and a tumbril cart, and other miscellaneous Nursery Stock.—May be viewed one day prior to the sale, and Catalogues had of the principal Seedsmen; and of the Auctioneer, Brompton Auction Ground, Fulham-road, Brompton, near London.

FULHAM ROAD.
TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. D. A. RAMSAY has been favoured with instructions from Mr. J. Shearman, to submit to public competition, on TUESDAY, October 15 and following day, at 12 o'clock (his lease having expired), on the premises, near Queen's Elm, Fulham-road, Brompton, a portion of the valuable NURSERY STOCK, comprising Standard and Dwarf-trained Peaches, Nectarines, &c., a large quantity of fine Evergreens, Deciduous Shrubs, Ornamental Trees, &c. A choice assortment of Standard and Dwarf Roses, &c. May be viewed prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen; and of the Auctioneer, Brompton Nursery, Fulham-road, London.

CHELSEA.—IMPORTANT SALE OF NURSERY STOCK.
TO NOBLEMEN, GENTLEMEN, AND OTHERS ENGAGED IN PLANTING.

MR. D. A. RAMSAY has received instructions to submit to public competition, by Auction, on the Premises, opposite Cremorne Gardens, King's-road, Chelsea, on TUESDAY, October 1st, and two following days, at 12 o'clock (without reserve), by order of Messrs. W. Dennis & Co., to clear about five acres of land required for building purposes. The Stock comprises a large assortment of fine Evergreens, large Irish Ivies, and other Creepers in pots; 300 varieties of the finest Prize Gooseberries, a large quantity of Mulberry Trees of all sizes, the collection of Standard, Dwarf, and Pillar Roses; choice Deciduous Shrubs, Ornamental Trees, &c. The Stock on view till the time of sale.—Catalogues may be had on the premises; of the principal Seedsmen; and of the Auctioneer, Brompton Auction Ground, Fulham-road, London.

BROMPTON AUCTION GROUND, FULHAM ROAD, BROMPTON (one Mile from Hyde-park-corner). Established for the Sale of all Kinds of NURSERY AND FLORISTS' STOCK BY AUCTION.

D. A. RAMSAY, AUCTIONEER and VALUER, &c., begs to inform his Friends, the Trade, and others, that he has commenced receiving (for the season), NURSERY and other STOCK intended for Sale by AUCTION. Terms, &c., sent on application.

D. A. R. begs to recommend these Sales to the notice of all Persons engaged in Planting, &c., as offering unprecedented opportunities of securing at extraordinarily low prices large or small collections of every kind of Stock.

N.B. Every accommodation provided for Buyers of Stock required to be packed for the country or the Continent.

FARMS TO LET AT MICHAELMAS NEXT.

MR. HURLEY, Farm and Estate Agent, is instructed to let the following, amongst other desirable farms: No. 1.—TWO EXCELLENT FARMS in Herts, 26 miles from London, and close to the Great Northern Railway, consisting of 526 and 287 acres respectively, admirably adapted for Turnips, Wheat, &c., and for carrying a large flock. Rents, 18*s.* and 21*s.* per acre; superior residences and buildings. No. 2.—A first-rate Farm of 160 acres, near Windsor; good house, &c. No. 3.—A capital Farm at Enfield, of 105 acres, equally divided; superior residence and buildings. No. 4.—An excellent Farm, with gentleman residence, &c., with 100 acres of very capital land, equally divided; situate in Essex, within 4 miles of the Harlow station. No. 5.—A good Farm in Sussex of 230 acres, well drained, and adapted to the growth of Wheat and Beans, but not of heavy tillage. Rent 20*s.* per acre, tithes, &c., 6*s.* Good Premises; tenant may propose his own terms. No. 6.—A small Farm of 61 acres, in Sussex, with Farm-house and two Cottages. Rent, on lease, 50*l.* a year. No. 7.—A capital Farm, in Kent, of 220 acres. Rent 135*l.* a year, tithe 30*l.* Two capital Farms, in Surrey, of 400 and 170 acres. Rent and tithes low; the latter tithe free. Another, in same county, of 600 acres; rent and tithes very low. Also a good Farm at Fulmer, Bucks, of 90 acres, nearly equally divided. And, lastly, three Farms, in Kent, consisting of 155, 123, and 76 acres respectively; rents low.—Apply for terms (inclosing two stamps) to the Auctioneer, 62, Nelson-square, Blackfriars-road, London.

WANTED, A SMALL FARM, from 20 to 50 acres. Particulars to be sent to Mr. HURLEY.

FARM TO BE LET, and entered upon at Michaelmas next. A most compact little FARM of about 70 acres, within a ring fence; a neat but small Farm-house has been lately built upon it; and the whole of the land has been recently drained. It is situated within 200 yards of the Botley Station, on the South Western Railway, within half a mile of one of the best markets in the county, at half an hour's distance from Southampton, Winchester, Fareham, Gosport, and Portsmouth; about 1¼ hour from Salisbury, and under 3 hours from London. There is a Liquid Manure Tank built of brick, in the farm-yard, and part of the Farm is bounded by a navigable river running into the Southampton Water, giving the advantage of water-carriage for bringing on the farm manure, and for taking off its produce.

For a view, apply to the present tenant, or to Mr. THOMAS ATKINS, Botley; and for further particulars and rent to Messrs. JENKYNS and PHELPS, Red Lion-square, London.

Printed by WILLIAM BRADBURY, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, SEPTEMBER 14, 1850.

FOREIGN BULBOUS ROOTS.

WM. HAMILTON, SEEDSMAN, &c., 156, Cheapside, London, begs to state that his Priced Catalogue of the above is now ready, and may be had (gratis) on application.

HYACINTHS in colours, named, for pots or glasses, 6*s.*, 9*s.*, and 12*s.* per dozen; in mixtures, 3*s.* per dozen. MIXED DUTCH CROCUS, 1*s.* 6*d.* per 100. TULIPS for early forcing, 1*s.* per dozen. SNOWDROPS, 2*s.* 6*d.* per 100. NARCISSUS, 4*d.* to 6*d.* each. GLADIOLUS, IXIAS, IRIS, RANUNCULUS, ANEMONES, and a large assortment of other Roots, the prices of which will be found in his Catalogue.

W. H.'s Improved Supporter for Hyacinths, &c., 6*d.* each.

*** Not to be equalled by any now offered to the public.

Address—156, Cheapside, London.

GEORGE JACKMAN, NURSERYMAN, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK Manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted. Priced lists of plant tubs and boxes forwarded on application.

BULBOUS FLOWER ROOTS CHEAP.

Carriage free, as see below.

The best sorts of fresh imported Hyacinths, Tulips, Irises, Gladioli, Anemones, Crocuses, Ranunculus, &c., may be had at much less than the usual prices, in valuable assortments, as under.

Choice assortment for pots, or glasses	...	...	£1	0*s.* 0*d.*
Do. do. in half the quantities	...	...	0	10 6
Do. do. *for open ground*	...	...	1	0 0
Do. do. in half the quantities	...	...	0	10 6

For particulars of the above assortments, see Messrs. SUTTON'S Priced Catalogue, just published, which may be had on application, inclosing one penny stamp, to JOHN SUTTON and SONS, Reading, Berks.

If Hyacinths only are required, Messrs. Sutton's best selection may be had at 10*s.* 6*d. per dozen, with names and colours, or second best selection* 5*s.*

N.B. Parcels of not less than 10*s.* value are sent, carriage free, to any station on the Great Western, South-Western, or South-Eastern Railways, or to any office in London or Bristol.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse, and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s.* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET-WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

TO GARDENERS, &c.

GUTTA PERCHA TUBING for Watering Gardens, spreading Liquid Manure, &c., may be had joined up to any length. Waterproof Soles for Boots and Shoes. Thread for tying up Plants. Gutta Percha Canvas suitable for nailing up Trees, &c.—Manufactured by THE GUTTA PERCHA COMPANY PATENTEES, 18, Wharf-road, City-road, London.

FIRST CLASS SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER.—*This beautiful flower was exhibited at the Chiswick Horticultural Fête, May* 18, 1850, *and was very much admired, and was also noticed by all the leading publications; a description of which will be found in the* Gardeners' Chronicle, *by* Professor LINDLEY; *in the* "Florist," *by* Mr. Beck; *and in the* "Gardeners' Magazine," *by* Mr. GLENNY; *all of whom speak in the highest terms of praise. Two Seedling Plants were also exhibited at the Royal Devon and Cornwall Horticultural Show, two days previous to the Chiswick Show, and won a Seedling Prize. It was noticed by the editor of the* Plymouth Herald, *and as it gives a good description of it we extract it.*

"One of the principal attractions at the Show was a magnificent Seedling Geranium, raised by William Rundle, Esq., Montpellier House, Devonport, and for which an extra prize was awarded. It attracted the attention of every florist, and was undoubtedly one of the best flowers in the room. The ground colour is a bright pink, with a *pure white centre*, extending over one-third of the upper petals. It has a rich and velvety crimson maroon spot, beautifully tinted, and shaded off to the ground colour. It is an extra-sized flower, of good shape and substance, like Lyne's celebrated flower, *Forget-Me-Not*. In fact, it has very much the habit of this sterling flower, being of a short, robust growth, and throws its fine flowers well above the foliage."

Further description would be unnecessary, more than for us to say, that we are certain it will give the most complete satisfaction to every customer, and we can recommend it with the same confidence that we introduced Lyne's *Duke of Cornwall, Forget-Me-Not*, and Arnold's *Virgin Queen. These are all sterling flowers and are much admired even at the present day.*

Price 20*s.* each. One given over three to the trade.

Good strong plants will be ready about the middle of October. Apply to WILLIAM E. RENDLE and Co., Nurserymen, Plymouth.

Our new descriptive Catalogue of Geraniums, Azaleas, Camellias, Fuchsias, &c., is just published, and can be had on application for one penny stamp.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

SAFFRON WALDEN.

SUPERB "DOUBLE HOLLYHOCKS."

WILLIAM CHATER begs respectfully to inform the public, that he is now sending out Plants of his unequalled collection of this ornamental flower. See Catalogue, which may be had on application, by enclosing a postage stamp. Hints on their cultivation given to purchasers, if required.

Saffron Walden, Essex, Sept. 21.

HEDENHAM ROSARY, BUNGAY, SUFFOLK.

THE BLACK PRINCE STRAWBERRY, now sending out at 10*s.* per 100.

Also PRACTICAL INSTRUCTIONS FOR THE CULTIVATION OF THE POTATO, containing the Competition Essay for the Prize of 1000 francs offered by the Belgian Government. Also Instructions on the Management of Asparagus, Seakale, Rhubarb, Vegetable Marrow, Scarlet Runner, Strawberry, Melon, and Cucumber; Chicory and Lamb Lettuce as Salads; the Lisianthus Russellianus, and the Tree Mignonette. The Destruction of Woodlice and Green-fly; and Peat Charcoal as a Manure. By JAMES CUTHILL, Horticulturist, Camberwell, London.—Printed for the Author, and sold by him only. Price 2*s.*; or, by post, 2*s.* 4*d.*

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Sept. 21.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s.* per 100.

Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s.* 6*d.* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 20*s.* per 100.—Manor Farm, Deptford.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

A LIST OF NEWLY INTRODUCED PLANTS NOW OFFERED FOR THE FIRST TIME BY JAMES VEITCH AND SON, EXETER:

Escallonia macrantha, 21*s.* each; one over to the Trade on three.

Ixora salicifolia, 21*s.* each; ditto.

Dipladenia urophylla, 21*s.* each; ditto.

Hoya coriacea, 10*s.* 6*d.* each; ditto.

Dipteracanthus spectabilis, 10*s.* 6*d.* each; ditto.

Oxalis elegans, or Oxalis elegans major, 5*s.* each, or three for 10*s.* 6*d.* of either.

Calceolaria grandis, 5*s.* each, or three for 10*s.* 6*d.*

IXORA SALICIFOLIA (TRUE), WILLOW-LEAF IXORA.

MESSRS. VEITCH AND SON are now prepared to send out strong plants of the above beautiful and distinct IXORA, received by them from Java through Mr. Thos. Lobb. It is a lovely free-blooming species, flowering in a very young state, and at the Chiswick Exhibition in July last received the first prize for new and rare plants—the Silver Gilt Medal. It is figured and described in Curtis's "Botanical Magazine" for July last.

Strong well established plants 21*s.* each; one over to the Trade on three.—Exeter, Sept. 21.

TULIPS, RANUNCULUSES, ANEMONES, HYACINTHS, GERANIUMS, AURICULAS, LILIUM LANCIFOLIUM, AND NEW PLANTS.

HENRY GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to inform the Nobility, Gentry, and Amateurs, that his CATALOGUE of the above FLOWERS is ready, and will be forwarded by post on application.

HOLLYHOCK—"QUEEN OF ENGLAND."

JOHN CHATER AND SON beg to announce that they intend sending out early in October, the above new Hollyhock, at 5*s.* per plant, or with it 11 other distinct Show varieties—the 12 for 35*s.*, hamper included, carriage paid to London. For colour and description see catalogue, which may be had by enclosing a postage stamp, addressed to J. CHATER and SON, Nurseries, Haverhill, Suffolk.

Post-office orders payable at Haverhill.

DUTCH BULBS AND OTHER FLOWER ROOTS.

THOMAS JACKSON AND SON respectfully announce that they have received, in fine condition, their annual consignment of the above; and as they import none but those of the largest size and best quality, purchasers may rely upon having fine roots.

Good mixed double Hyacinths for Borders, 3*s.* 6*d.* per dozen.

Fine named double and single Hyacinths for Glasses or Pots, from 6*s.* per dozen.

The newest Crocuses, and all other Bulbs at the same moderate rate.

ROYAL GARDENS, HAMPTON COURT.

Having added by lease these famous Gardens to their previously extensive premises, "T. J. and Son" now possess the largest Glass Establishment in the Trade. To their General Stock, they respectfully invite the inspection of Noblemen, Gentlemen, and Purchasers, who will find in fine health and great quantity (in the Fruit Department), Fruiting and Succession Pines, Figs, Vines, Cherries, Strawberries, &c., in pots for forcing; (in the Flower Department), Orchidaceous, Stove, Greenhouse, and Herbaceous Plants; (and in the open Ground), Fruit, Ornamental, and Forest Trees, Shrubs, Roots, and General Nursery Stock on Sale, at the lowest remunerative prices.—Nursery and Seedsmen, Kingston, Surrey, Sept. 21.

[ADVERTISEMENT.]

THE PENNY-PLANT GENTLEMAN TO MR. DICKSON, Editor of the Floricultural Department of the GARDENERS' AND FARMERS' JOURNAL.

SIR,—After reading your unwarrantable attack on my character, in the Journal of the 10th August, which a friend has sent me, and presuming you have only a tenth of the superior abilities you assume, *you must have known it to be false*, and for that reason my first idea was to take Lynch-law on your person, but it was at the moment not within reach—the next, legal proceedings; but on consideration I found I could not consistently give my oath in court that you have done, or will do me, any injury. On the contrary, after getting cool, I now think you have just filled a vacancy I wanted, by electing yourself my engine-driver, to clear the way for my second trip; and, what is equally good, you say you are provided with stokers and fuel. You are a bold fellow, Dickson, as you confess, in taking the charge, that it is new to you. You even say that you do not know how the machinery works; but rely on your long experience, in putting on the drag, as driver of Dickson and Co.'s old waggon, that you and your cowardly backers can stop the steam. If this is all you have to trust to, I think the sooner you get back to the old waggon, before your assistants leave, the better—though shakey, it may last you some time. Placing yourself on the rails under such circumstances is little short of madness, particularly as my second is an express and is already started; the passengers—principally ladies, the second and third classes, surrounded as they are with first class Verbenas, Geraniums, &c., unknown to them before in such profusion—look so happy, that I cheerfully accept, at their warm hearted requests, to act as director and guard. From the slight view I have taken, I see many of the former seats filled with the same parties, and what is very gratifying, some have brought their daughters and mothers. Having been the road before, we are now going cheerfully on, as they have had ocular proof that I will not deceive them; that however much dust you and your dusty companions may create, I will try and take care that it does not blind them. But to be serious; you have wilfully left out the words bedding-out plants, which any one referring to my Advertisement will see that it alters the meaning; and any one at all conversant with Flowers must know that first-rate bedding-out Plants are different from new Florists' Flowers. Though every year is adding to this class of plants, still before they have weathered the storms, and shown their habits for a season out of doors, and proved worthy, they cannot in justice be called first-rate for that purpose, however beautiful and suitable for pot culture under glass. I also challenge you to produce one single instance of my sending out new Florists' Flowers as first-rate at high prices. I also challenge you to produce a single instance of my offering Cups, Medals, or Money as prizes for my own seedlings coming out the same season. I may also add that I do not offer new plants the first year at one penny, though judging from what has come out this year, many of them are hardly worth it; but why not the raisers of new flowers make arrangements amongst themselves, and rule the prices the first year, say, for Verbenas, 5*s.* in May, 4*s.* in June, &c.? I, for one, though held out by the editor as a destructionist and impostor, will agree to it. My object is to send out really good bedding-out plants, without any regard to when they came out, such as the first gardeners in the kingdom cultivate, with the view of supplying a class that takes great interest in flowers, but cannot afford to give annually 6*d* per plant for bedding out stuff. A sample of the Verbenas was exhibited at the Botanic Society's show in June and July, and we believe the best ever shown. I have been a grower of flowers upwards of 36 years, and have had prizes more than 30 years ago; and I remember, as if it only occurred yesterday, who I got my first Tulip, Rose, Hydrangea, &c., from, and can fully appreciate the pleasure of those that are fond of flowers when they gain their object. I believe that I was the first that had medals for seedling and specimen plants of Verbenas in London. I am also in the full belief that it will do nurserymen good, by allowing the amateurs more room in their houses for choice plants, and I have no doubt that it will create thousands of new customers; and, therefore, will give greater scope for the raisers of new varieties and novelties, supported as I am by the ladies, and having the good fortune this season to have the services of that now rare animal SUPPOSITITIOUS DICKSONII, which I hope to make good use of as a novelty to attract attention for 1851. And as my system of growing plants by the 100,000 appears beyond your comprehension, you, like all ignorant and obstinate people, condemn what you do not understand. Though I had 100,000 unsold this season, I will try again to deserve the name of "the penny plant gentleman" (*not self christened*) which you say has novelty to recommend it, and leave the vendors of Primroses and Lavender, three bunches a penny, for the present, to the protection of Mr. Dickson, who appears to me, by his leading article of the 10th, to be more qualified for them than editor of a paper that claims the character of being the *only organ of publicity for genuine property and honesty.*

Stowe, Buckingham. DAVID FERGUSON.

P.S. The above was sent to the journal, but as it appears not consistent with their sort of justice, it has not been inserted; I therefore respectfully inform the proprietor of the above journal that if not inserted the following week after this notice, I will take out legal proceedings against him.

FERGUSON'S SUMMER AND WINTER BEDDING-OUT PLANTS.—Ladies and Gentlemen, if you want choice for the summer you will find it advantageous to order now for May, 1851. I have room to winter almost an unlimited number; and where the reference is respectable, and no doubt of their genuine quality, I will not wish a remittance till they prove worthy.

I also offer, at double the price, the following, in about equal quantities, for filling the beds in winter, and which can be removed to a reserved place before planting the Verbenas, &c., in May, and returned again and again, without injury. Nice plants of Aucuba japonica, Chinese Arbor-vitæs, Junipers, Green Holly, Laurestinus, Tree Box, Common and Portugal Laurel, Cotoneaster microphylla, Yew, Berberis aquifolium, &c. For larger stuff, see other advertisements. As the rail is completed to Aylesbury and Buckingham, D. F. invites inspection. For specimen plants, the former; small, the latter.

DAVID FERGUSON, Nurseryman, &c., near Buckingham.

ULMUS MONTANA, var. PENDULA FOLIIS VARIEGATIS, the Weeping Silver-striped Wych, or Scotch Elm.

MESSRS. PONTEY beg to inform the Trade and the Public that they intend sending out the above splendid Tree this autumn.

The variety is an original with themselves, and was found in their Nursery some years ago. It is equally robust and pendulous in its habit with the common Weeping Elm, and its leaf is distinctly striped or margined with silver. It is remarkable for its constancy in variegation, seldom or ever producing an entire green leaf. Several eminent people in the Trade have this summer seen the Stock of Plants, and pronounce it one of the greatest novelties in its line that for a long period has been introduced. The Plants are worked on stems from 3 to 6 feet high. One year worked, 10*s.* 6*d.*; two years, 15*s.*; and three years, 21*s.* each.

MESSRS. PONTEY have also on Sale an extensive Collection of Ornamental Trees and Shrubs, catalogues of which can be had on application.—N.B. Remittances or references will be required from unknown correspondents.

Nursery, Kirkheaton, near Huddersfield, Yorkshire, Sept. 21

MESSRS. KNIGHT AND PERRY feel themselves called upon to offer their most grateful acknowledgments for the confidence with which their numerous Patrons have recurred to them when in want of GARDENERS, and beg most respectfully to state that the scrutiny and vigilance they have always employed in selecting good and clever men (to which the almost invariable satisfaction that has so long attended their recommendations is mainly attributable), is, if possible, increased now; and that the steps they take to arrive correctly at the private as well as the professional character of those they send out as Gardeners, Foresters, Bailiffs, &c., induce them to engage, unhesitatingly, to furnish first-rate men in these capacities whenever called on to do so.

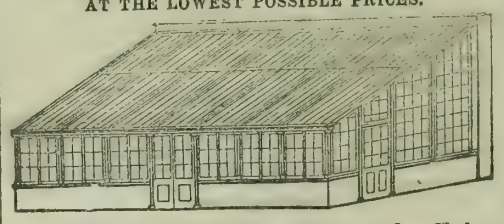
Exotic Nursery, King's-road, Chelsea, London.

UPTON PARK.

SLOUGH DAHLIA SHOW, SEPTEMBER 26.—W. BRAGG, of the Star Nursery, will give a SILVER CUP, value five guineas, in addition to the other Seven Prizes offered, to Amateurs and Gentlemen's Gardeners, for the best 12 blooms of DAHLIAS, dissimilar flowers, to be ready for the judges by 12 o'clock, and remain till 6. Fancy Dahlias, six blooms; new Dahlias, Pansies, Roses, Hollyhocks, &c., as usual. Seedling Dahlias, three blooms, in stands.

BULBOUS ROOTS, GRAPE VINES, &c.

J. WEEKS and Co., King's-road, Chelsea, beg to inform the Nobility and Gentry that they have now got a large collection of fine Bulbs, which they can supply very cheap. Small collections made up, consisting of Hyacinths, Narcissus, Tulips, Jonquils, Crocus, Snowdrops, Gladiolus, Alstrœmium, Anemones, Ranunculus, Iris, Scilla, and other appropriate kinds, for 30*s.*, 20*s.*, and 10*s.* Priced Catalogues sent upon application. Also a very fine collection of GRAPE VINES IN POTS, from eyes two and three years old, for FORCING IN POTS or PLANTING.—STOVE AND GREENHOUSE PLANTS in extensive variety.



J. WEEKS and Co., King's-road, Chelsea.

BECK'S PELARGONIUMS AND OTHER RAISERS' VARIETIES.—Twelve of the following Varieties ARE NOW READY TO BE SENT OUT in exchange for a post-office order on Brentford for Two Guineas, including package and delivery to London: Blanche, Centurion, Cassandra, Crusader, Delicatissima, Dorcas, Emilia, Gustavus, Gulielma, Lalla Rookh, Lamartine, Mont Blanc, Meleagre, Minna, Ondine, Princess, Alonzo, Ruby, Rosamond, Star, Symmetry, and Sarah.—Post-office orders are requested to be made payable to JOHN DOBSON. The Varieties of 1849 are not yet ready, but those of 1848 may be selected. Descriptive Catalogues may be had upon application to J. D., enclosing a postage stamp.

N.B.—Growers of Pelargoniums should provide themselves with what they require at once, and shift them into larger-sized pots than they are sent out in.

Worton Cottage, Isleworth, Sept. 21.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

GREEN AND HOTHOUSES made by Machinery, warranted best materials, glazed 16-oz. sheet glass, of a large size, with glass at both ends and one door, painted three coats of best oil-colour, and delivered to any Railway or Wharf in London.

Lean-to.				Unglazed.			Span-roofed, glass all round.

These Greenhouses are prepared in such a manner that any country carpenter can fix them with ease. A plan is sent free for the brickwork, &c.

Estimates for erecting and heating the above, on application. Lists of prices for Sash-doors, &c., post-free on application.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

PIMLICO SLATE WORKS.—Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, engages to supply the Public with the NATURAL GRASSES AND TREFOILS, in mixtures suited to the description of soil which may be named, at 1*l.* per acre, allowing 3 bushels. The Seeds to be delivered on the railway. Mixtures for Lawns and old Pastures at an equal reduction. These Seeds are gathered by a gentleman, who, having made them his study from boyhood, now offers the result of his labour for the good of the landed interest, who are so suddenly and unequally taxed.

A reference is required from unknown correspondents.

E. FOSTER, ESQ.'S, NEW PELARGONIUMS.

WM. BRAGG is authorised by EDMUND FOSTER, Esq., of Clewer Manor, to send out his new and choice varieties for 1850, Catalogues of which can be had on application. The Rev. Mr. ROUSE has likewise favoured W. B. with the stock of his superb Pelargonium "ALIBI." Other good and approved sorts; for description and price, see Catalogue, which contains lists of Chater's and other new and superb Hollyhocks, Pansies, Pinks, Picotees, Carnations, Roses, Chrysanthemums, &c.; ground and pot roots of show and fancy Dahlias.—Star Nursery, Slough, Bucks.

NURSERIES, CHESHUNT, HERTS.

A. PAUL AND SON respectfully inform their Customers and the Public in general, that their New and Descriptive CATALOGUES of Roses and Hardy Ornamental Flowering Trees and Shrubs will be ready by the 1st of October. Applications, enclosing two stamps for the Rose, and one for the Tree Catalogue, will be immediately attended to.

TREES, SHRUBS, ROSES, VERBENAS, &c., FOR THE MILLION.

DAVID FERGUSON, LANDSCAPE GARDENER, CONTRACTOR, PLANTER, &c., offers common Laurels at 1*l.* to 5*l.* per 1000; if 100,000 are taken 10,000 will be added. Good standard Roses, 3 to 6 feet, 5*l.* per 100, and 40*l.* per 1000. Berberis aquifolium, fine, 1*l.* to 3*l.* per 1000. Evergreen Privet, strong, 1*l.* to 1*l.* 5*s.* per 1000. Cotoneaster microphylla, for hedges, &c., fine, 10*s.* per 100, and 4*l.* per 1000. Also large quantities of the following at low prices:—Fine specimen Cedrus Deodara and Pinus excelsa, 4 to 6 feet in height, in pots; fine specimen Arbor-vitæ, Aucuba japonica, Yews, Box, Phillyreas, red Cedars, Araucarias; Scotch, Silver, and Spruce Firs; Larch, Oak, Elm, Ash, Lime, Hornbeam, Hazel, double pink and scarlet Thorns, fine maiden Peaches and Nectarines, worked from trees in the houses on the spot; some of the fruit was exhibited at Regent-street, and received a Banksian Medal, this season, though very inferior to what D. F. has sent to his fruiterer at different times this season, which can be proved; with large quantities of other Fruit Trees. Also first-rate Verbenas, Petunias, Calceolarias, Geraniums, Fuchsias, Anagallis, Salvias, Cupheas, &c., for bedding out, at 1*s.* 6*d.* per dozen, if 5 to 20 dozen are taken; 1*s.* 3*d.* if 20 to 50 dozen are taken; above 50 dozen, 1*d.* each; and if 100 dozen are taken, 5 dozen will be added. Carriage free to London, Birmingham, Leamington, Peterborough, Banbury, Bedford, and all intermediate stations on the North-Western Railway.

Lists marked for selection at the above prices sent free on application; but to those not already in possession of a collection, D. F. advises parties to state the colour and quantity they want, and leave the selection to him; and to those that have no convenience for wintering plants, they will find it advantageous to give their annual orders in August and September for the following spring, as they, on taking five dozen and upwards, will have the choice not only of those marked in the list, but any other bedding out plant, if possible to procure, at equally low prices.

Letters directed Buckingham (where all Post-office orders are requested to be made payable), in place of Aylesbury, reach D. F. one day sooner.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 8 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

TO NURSERYMEN, FLORISTS, &c.

A. VAN GEERT, Florist, Ghent, begs to inform the above that he has just published his New CATALOGUE OF PLANTS, which may be had on application to his Agents, Betham and Blackith, Custom House, Shipping, and General Forwarding Agents, Cox and Hammond's Quays, Lower Thames-street, London.

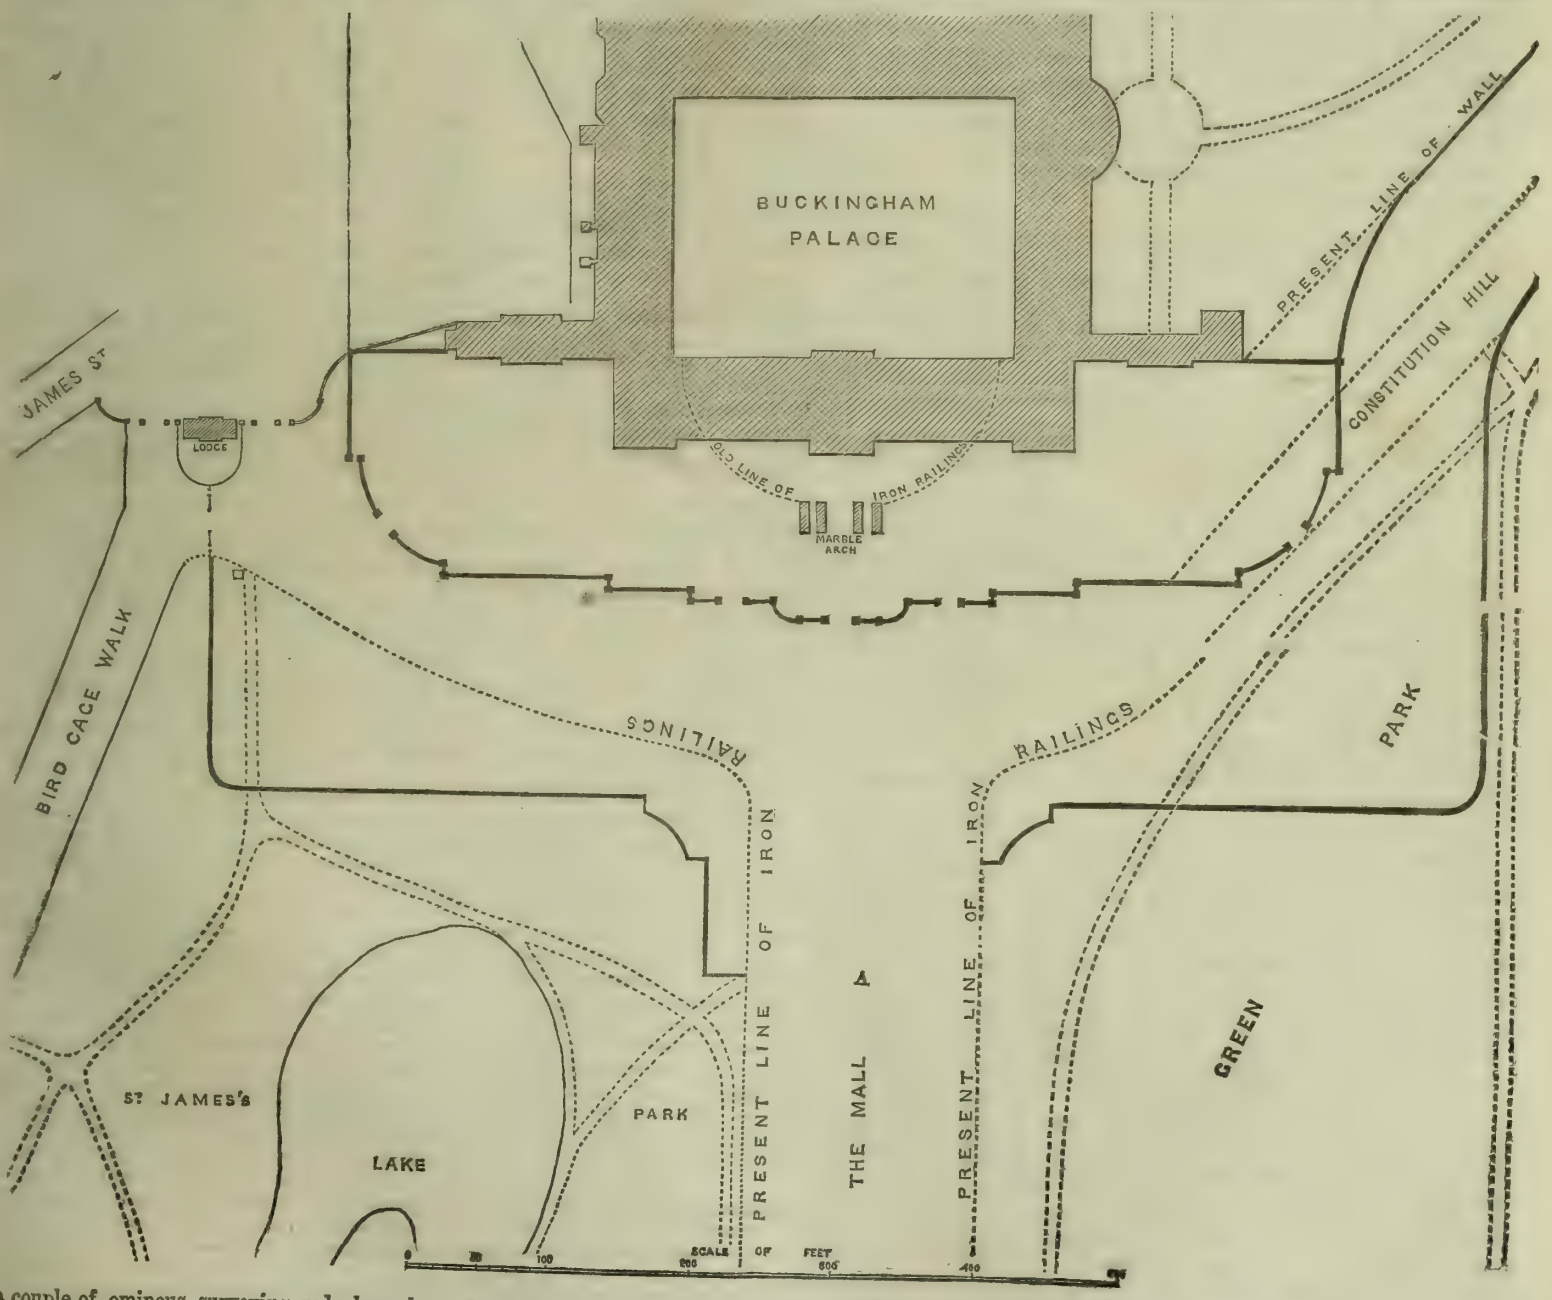
MESSRS. VEITCH and SON'S CATALOGUES OF NEW AND RARE PLANTS, STOVE AND GREENHOUSE PLANTS, GERANIUMS, AMERICAN PLANTS, &c., &c., are now ready, and can be had, on pre-paid application, by enclosing two postage stamps.—Exeter, Sept. 21.

WILMOT'S "PRINCE ARTHUR" STRAWBERRY.

J. WILMOT begs to state that he will commence sending out his new Strawberry next week. Orders forwarded to himself or the following agents will be duly executed. Price 5*l.* per 100.

Agents.—Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Charlwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street.—Isleworth, Middlesex, Sept. 21.

The Gardeners' Chronicle.



SATURDAY, SEPTEMBER 21, 1850.

MEETING FOR THE ENSUING WEEK.

Country Show.—Tuesday, Sept. 24: Whitby Floral and Horticultural.

An outery has been raised against the Woods and Forests by a part of the daily press, who, in their zeal for popular rights, fancy they have discovered a flagrant case of popular wrong. A few workmen have been seen cutting a straight line across the esplanade in front of Buckingham Palace; a couple of ominous surveying rods have been observed in the Green-park; some costermongers' carts have been detected emptying themselves of their loads in front of the palace; and, in connection with this, the famous marble arch has begun to disappear. Hence it has been inferred that Lord Seymour is about to perpetrate some official enormity.

According to the *Times*, the Commissioners are "coolly proceeding to occupy a large slice of the Green-park temporarily, and a section of St. James's-park *en permanence*;" the public is hereafter to discover, "to the *universal disgust*, that the beauty of both parks has been marred, and the proportions of one cruelly curtailed." "Ministry and Parliament having alike fled from town, the censures of the member for Montrose having melted into air, and the 'pledge' of Sir Charles Wood having become a thing of the past, the Commissioners set bravely to work with 11,000*l.* in hand." They begin by pulling down the famous marble arch. "They had not settled where the arch was to go, but at all events it must come down; so a road is made into the nearest field, which happened in this case to be the Green-park, and there, shrouded by a wooden enclosure, the relics are to lie till an available position is found. If the place of reconstruction is so uncertain, it might have been as well to hire the yard of some eminent builder and store the materials in a more fitting locality. The only alternative is to suppose that there is *some definite object in the choice of* so singular a stone-yard as the sward of the Green-park hard by the palace windows."—"The Woods and Forests have commenced their campaign by cutting off a fine piece of St. James's-park, and are proceeding to pile up the dismembered arch in the middle of the Green-park. Any one may see that, having effected a beginning of their plan, and bored all London with their stone-yard during the time of the Exhibition next year, and perhaps for some years after, they will agitate for some more money in order to finish the job." We next have a formidable account of some intentions entertained by Mr. Nesfield of constructing magnificent gardens in front of Buckingham Palace, to be cut out of the Green-park and St. James's-park; and an assurance that the ornamental water is to be curtailed. "From the clearance already made at the upper end," says the *Times*, "we discover that one-third of the whole length of the lake would be cut off."

It is difficult to conceive how a journal, with such means of ascertaining the truth as the *Times* possesses, could have fallen into this series of mistakes. The statements are made under a total misapprehension of the intention of the Commissioners and of the facts of the case, as will be seen by the accompanying plan, in which the works now in progress are indicated by solid lines, and the existing boundaries of roadway and iron fencing, by dots.

From this it appears that it is intended to form a court-yard in front of the Palace, about 50 yards broad and 264 yards long, for the purpose of diverting the existing roadway from the walls of the palace, and of securing some degree of quiet to its inhabitants; and that in order to replace the roadway thus removed, Constitution-hill will be made to sweep gracefully round the new court-yard, while a similar bend will be given to the line of road from Pimlico. In carrying out this plan a small triangular morsel of the useless naked ugly end of the enclosure in St. James's Park will be cut off; the water will not be approached within 100 feet, and no interference whatever will take place with public convenience. On the contrary, public convenience will be consulted, and the appearance of one of the few public buildings in London which people care to look at, be wonderfully improved.

These are the exact alterations which are "to create universal disgust, to mar the beauty of the parks, to curtail their proportions with unheard-of cruelty, and to cut off one-third of the whole length of the lake!" Surely a mare's nest of such dimensions was never found before.

Can any one doubt that instead of "the beauty of the parks being marred" it will be very greatly improved? The appearance of Buckingham Palace has been the subject of some just and much unfair criticism; it is admitted very generally to be unworthy the sovereign of England; but whether that be so or not there the building stands, and it must be finished. The works now in progress are the completion of it; they are as necessary to the building as any other portion of the decorations. Not to construct them would be to leave the Queen's London residence in the same state as a London shopkeeper's house without its area railings. Until the marble arch is down, and the outer court-yard, with the road surrounding it, is completed, the front of the palace must remain little better than a stone-yard. We confidently believe that these changes will be productive of as beautiful an effect as is

attainable under existing circumstances. The main public approach to the palace will be by the Mall, which, stopped by the court-yard, with its graceful outline, will extend symmetrically to the right and left, on the one hand leading to Constitution-hill, and on the other to the Birdcage-walk and Pimlico.

As to the end of the ornamental ground in St. James's-park it will undergo no change; there will be no curtailment of the lake and no interference with public convenience; its end will be turned, so as to suit the new court-yard; and that is all. For our own part we could have wished that some alteration of this end of the Park had been made; it is evident that the original design was here left incomplete, with a view to some change like that in progress; for it is inconceivable that the refined taste which planned the modern park would have placed the ugliest portion of it, a portion which is a blot upon the plan, next the front of a Royal Palace.

The unfortunate marble arch is another subject upon which the *Times* is eloquent. It is astonished at its removal to the Green-park (a place within a few yards of its present position), and suggests that it is put there because the Woods and Forests have a lurking affection for a certain "discarded plan;" and in another place the public is assured that there must be some definite object in the choice of so singular a stone-yard as the sward of the Green-park, hard by the palace windows. We dare say there is a definite object, and we would suggest the great probability that the place to which it is to be removed is some point in advance of the palace, towards the Horse Guards. It is indeed reported that Lord Seymour's wish is to have it at A. in the annexed plan, a not inappropriate position; and if so, it must, we think, be admitted that a more convenient station for the "stone-yard" could not have been selected until the arch can be reconstructed.

We have alluded to "a discarded plan" by Mr. Nesfield. This is described as follows: "It proposed to make two large ornamental gardens in front of Buckingham Palace—one on the north, and one on the south side of the Mall; the northern one being taken out of the Green-park, and the southern one out of the ornamental enclosure in St. James's-park. The two would extend in length from Stafford-house to the western extremity of the Mall, and in breadth from the Birdcage-walk to the straight path leading into Cleveland-row. The marble arch would be placed in the centre of the Mall, parallel with the east side of the two gardens and between them." It would be difficult to find any person of taste not ready to admit that gardens like these would be a beautiful feature of the ground; and that they would harmonise much better with the architectural features of the Palace front than the rough shrubbery and little water squirt which they would cover. Nor would they curtail the space open to public recreation; because they would be as public as the gardens of the Tuileries; in fact, their area would be greater than the present area by the whole surface of the water which they would displace, and which is now only to be looked at.

But all this speculation is as useless as the description in the *Times;* for there is no intention whatever of executing Mr. Nesfield's design, as will be seen by our plan of what is really doing; and it is probable that it never will be executed. Experience shows that John Bull, who is eager enough to censure Government for the paltry appearance of all public buildings, is still more eager to withhold the means of doing anything noble and worthy of comparison with foreign architectural works; and we see no probability of Buckingham Palace being more favoured than other places.

Many attempts have been made in this country to call the attention of the public to the mass of nutritious food which decays neglected in our woods and fields every autumn, in the shape of fungi. The prejudices, however, against any general appropriation of these viands seem almost insurmountable, and they are every now and then confirmed by some lamentable occurrence like that which lately took place at Bristol, from the use, as it is said, of some large species resembling the common Agaric. Unfortunately in such cases it is seldom possible to determine accurately the species which have been eaten, much less the attendant circumstances, a due appreciation of which could alone lead to any trustworthy result. In the cases which have come under our own notice there has always been a little mystery about the matter. At Cambridge, some years since, a whole family suffered from eating Blewits (*Ag. personatus*) a species commonly sold in the London markets, and used regularly in some families as an excellent article of food. Other species however were known to be intermixed in small quantities, though scarcely determinable when received, and it seems more just to attribute the evil result to them than to a species which is acknowledged to be generally safe and wholesome.

In the Bristol case we have seen no specimens, except indeed some sent to us from Clevedon-court are the same with those said to be common in Leigh Wood; but, as far as appears on its surface, the species in question was the common *Ag. arvensis*, a species exposed for sale in immense numbers in our markets, and one of which we never scruple to make use. During the course of last autumn we examined multitudes of Mushrooms in Covent Garden market, and, except forced specimens, we did not see a single true Mushroom, though many bushels were strewed about the stalls. It is very difficult therefore to understand how a species eaten very extensively with impunity, should in some individual families, where the number of their component members is not small enough to account for any peculiarity of constitution like that which renders mussels dangerous, prove not merely injurious but fatal. It is probable that in all such cases the quantity taken into the stomach has been large; and it is possible that, in some, mineral poisons may have been concerned. Amanitine, the principle on which the dangerous property of fungi depends, exists very possibly in different proportions in different samples; and it is natural to expect that those which are produced artificially should exhibit, on analysis, a comparatively smaller proportion of such principles, in consequence of being removed, when growing, from the influence of light. At present, however, the chemical analyses of these productions are far from complete; and it is much to be desired that comparative experiments should be made of *Agaricus campestris*, produced naturally and artificially, as also of *A. arvensis*.

In most foreign markets there is a public inspector of the fungi exhibited for sale, and it is said that in consequence accidents are extremely rare. Were the quality, however, of particular species very variable, no system of inspection could guard against accidents, except indeed, as at Paris, no Mushrooms were admitted except those raised artificially. We cannot help therefore suspecting that, where accidents do occur, it would be found, on fitting examination, that the fault did not lie against species which experience has pronounced wholesome, but was due to an ignorant admixture of really deleterious kinds.

A correspondent reproaches us with allowing others to give bad advice. He says; "I am aware the conductor of a periodical cannot be considered responsible for such advice, yet I think it behoves him to be careful, that great mischief does not ensue from following it. This must be the case if Potato growers should be induced to imitate your correspondent in this day's *Chronicle* respecting the taking up the crop. I have been a very large grower for the last 30 years, and during my early years I made many experiments about the time of taking up and the manner of securing them. Much, I believe, yet remains to be proved as to the best mode of keeping them, but I have invariably found that fully ripened Potatoes weigh the heaviest, keep the best, and are much the best in flavour. Shaws are getting ripe, and perhaps may be taken early, but I appeal to the salesmen in Covent Garden market to justify me, when I say that there is not a ripe Regent to be found in the market, neither will there be for many days to come. October is quite early enough to dig for storing the main crop of Regents; and if your correspondent would consult any of the small market gardeners, they would assure him they never so well please their customers as when they dig for their daily supply quite up to the severe frosts. And further, if he will leave a small piece undug, and covered with mulch, to keep out the frosts, he will not require to be told how vastly superior will be the fresh dug Potatoes to the ordinary stored ones."

He must be a very careless reader of the *Chronicle* who charges us with allowing bad advice to go forth under the guise of "Correspondence." On the contrary, it must be obvious that we almost overstep the bounds of courtesy, in criticising our correspondents' statements. The views of the gentleman whose censure we thus notice are precisely what we have advocated for years. So long ago as the year 1846, we pointed out, by the example of Mr. Shepherd, of the Calf of Man, the great advantage of leaving the crop in the ground. In fact, we said then, what we now repeat, that if it were not for the inconvenience of the practice, the best way of storing Potatoes is to leave them in the ground where they grow, guarding them only from wet and cold.

The soundness of this principle is incontestable; but like many other sound principles, it cannot be observed, except in a few cases. It is for the public to consider in what way it can be best applied. As to the particular passage to which our correspondent objects, we cannot discover where it is, and therefore give this general disclaimer.

HOW TO MISMANAGE A GARDEN.

Chapter VII.—Potting is an operation in which the talents of a mismanager are generally conspicuous. The quality of the implement, its size, and the mode of using it, are each subjects in which he is particularly conversant.

In the selection of pots he will always take the softest, because he thinks they suit plants best; that is to say, they become dry sooner than others, are hottest in the sun, coldest in draughts, the most difficult to clean, and by far the most perishable. The latter circumstance is of no consequence, for it increases the potter's bill, and expense is no object with him, as has been already shown.

In preparing earth in which potted plants are to grow, the same skill should be conspicuous. Always sift your earth as fine as you can get it; it looks so nicely. Ram it down as tight as you can; that prevents water running off, and saves the watering-can; if it is "rather stiffish," so much the better; there will be the sooner a nice hard ball.

When you crock a pot, don't put one large crock over the hole, and a handful more over that. One is quite enough; whether it lies over the hole or on one side, is a trifle; if it does not cover the hole, the earth will, if you only press it down tight enough.

Always keep your plants in small pots—as small as they will grow in; and never shift them if you can help it. By this means you will ensure nice little specimens, and you may have four or five times as many sorts in the same space as your neighbour, with his one-shift system. Perhaps he will have more flowers and a finer display than you; but what then? You will have a much larger collection. If the plants should happen to die, do not throw them away on any account, but leave them with their sticks in; they will show what a famous collection you have had. The advantage of this may be seen by any one who visits Sir Andrew Aguecheek's houses in the county of York.

There is a foolish fashion of growing what they call Coniferous plants for out-of-door specimens; if you fall into that fancy take especial care that your plants remain in the pots long enough to get corkscrew roots; this is easily managed by considering well, say for three or four years, where you will put them; and in the meanwhile if you keep them in small pots standing on cinder-ashes, plenty of nice young roots will come out of the bottoms of the pots. Some say that corkscrewed Pine trees are apt to blow over when they are old; if so, that is an additional reason for getting them into such a condition; a Pine tree reeling over from the perpendicular is picturesque.

Perhaps you would like to repot a plant; in that case never touch the old ball; let it alone, and drop it gently into the new pot, working some nice fine mould all round it. You will see immediately how easily it receives water; liquid will be through the hole in the bottom almost as soon as it touches the mould. Smith says that it won't touch the roots; but never mind him. Have not your father and your father's grandfather always done as we advise? And how can a man do better than walk in the way of his forbears?

May be you intend to pot Strawberries for forcing; if so, mind not to put them into the pots till you want to set them going; their roots cannot be better than in the open ground. At all events, if you do pot them beforehand, it is essential that you should not do it before the end of November; having done it, put them in a corner till you want them. Some people pack them in Bracken or leaves, or some material that will shelter them. Do not follow so ignorant an example. Is not a Strawberry hardy? what need, then, can it have of protection? To be sure the great forcers of Strawberries take much pains to shelter their plants till they are wanted, and to prepare them months beforehand: but these are the prejudices of mere practice, and beneath the genius of a mismanager. Κῆπουρος.

VILLAGE EXCURSIONS.—Letter I.

You have taken such prominent notice of our little village excursions, that I cannot decline responding to your wish, that I should give your readers a few further details concerning them. If such details should not be adapted to all localities, they may perhaps be suggestive of other methods of proceeding, suitable to the circumstances of each case. Here, we are a purely agricultural village, in a very out of the way district of Suffolk, at 6 and 7 miles distance from the two nearest railway stations. Very few of our grown up labourers can either write or read, which is the case also with some of our farmers, the majority of whom are only small occupiers. When I came to reside here, 10 years ago, it struck me as a bad feature in the habits

of the place, that the labouring population had few opportunities allowed them for enjoying a day's holiday, beyond the one customary holiday at Whitsuntide. Plenty of hard work, without recreation for body or mind, was the usual life of the best labourer, and the more especially, if he were one of that description of character, not unfrequent among us, than whom there can scarcely be named a better specimen of a simple-minded Christian doing his duty in that state of life to which it has pleased God to call him.

Your readers may be sure that in a large half-impoverished village, where many of the occupiers are unable to employ the amount of labour requisite for the efficient cultivation of the soil, there will be found not a few irregular characters debased in their habits, and dangerous in their dispositions. Such characters will always take care to have their periods of recreation; but, unhappily, when the choice is entirely left to themselves, they have recourse only to the lowest and coarsest forms of self-indulgence. We all know what is the usual resource of the uneducated and vicious—hard drinking at intervals, if not as a constancy. Tales are even told of certain delegated lords over many acres, who, in bygone times, would sit at table drinking for three days and three nights, after a "frolic," as all entertainments in eating and drinking are designated in this part of the world. It was the "parson's frolic" for the occupiers of farms at the tithe audit; it is the "gentleman's frolic" to his tenants on rent-day; and the "farmer's frolic" to his labourers at harvest home. Although I have, happily, not heard of any such prolonged outbreaks in my own time, I cannot deny that I have formerly known a few to keep their seats for 24 hours after I had left the table at one of these "frolics." However, nothing so bad as this has happened, to my knowledge, for some years.

It has always appeared to me a most advisable object to endeavour to wean people (so far as influence and example may enable us) from low and degrading forms of indulgence, by teaching them to take pleasure in healthy recreation, and in gratifying and agreeable exhibitions. Without dwelling upon the various ways in which such an object may be attempted, past experience has satisfied me that the description of excursions of which you have taken notice at p. 547, when properly looked after and subjected to due control, are among some of the very best means at our command for affording rational and agreeable recreation. They serve to awaken in us all a spirit of mutual toleration, and due respect for whatever may be peculiar to our relative positions in society.

On such occasions we may safely assist in improving the enjoyments of the day, by promoting innocent amusements for which we no longer retain a relish ourselves, or perhaps may never have possessed any. It has surprised many persons to witness how orderly and inoffensively some of the very roughest natures will join in such recreations as I allude to, when they have been forewarned of the terms on which they have been invited to partake of them.

When I made some early attempts at introducing recreation, of one sort or another, into our "parish routine," one of these consisted in a display of fireworks on my lawn. It was then earnestly represented to me by those who fancied they thoroughly understood the disposition of their labourers, that it would be a fatal experiment to admit them on my premises after dark, as I should inevitably find much wilful damage would be the consequence. Some slight damage may now and then have occurred from sheer ignorance that a labourer could possibly be doing anything very wrong by walking through a hedge (like a sportsman!) in preference to going round by the gate; but I do not remember to have had cause to regret a single act of wanton mischief upon any occasion when the people had free access to my premises, upon the understanding that I was placing confidence in them. I believe as many shillings would cover all the damage that I have received in as many years.

I find I have allowed my pen to run on in merely prefacing what I was proposing to communicate, and you must now draw your pen through every sentence you consider superfluous. A few scattered hints may serve to indicate the general condition and character of our people, better than any more formal description; and as I have no time to spare for condensing, you must allow me to put down my remarks as they come to mind, and then you can make use of such as you consider may be serviceable. I must reserve for another letter what I have to say about village excursions. *J. S. Henslow, Hitcham, Sept.* 5.

VILLA AND SUBURBAN GARDENING.

I REMEMBER the time when the production of a Cucumber in winter was considered a mighty horticultural feat; and when such a thing was accomplished by some lucky gardener, his neighbours were placed in no very enviable position. Where accommodation is afforded, the case is different now. In the hands of a good gardener, a Cucumber pit, properly constructed and efficiently warmed, will secure an abundance of fruit throughout the winter, or, if need be, during the whole year. Amateurs, however, rarely possess proper conveniences for such operations, and the question arises, Can Cucumbers be produced in winter without such a structure? I answer, Easily; and I shall proceed to point out how the thing can be effected.

I must premise that I write for those who possess some kind of structure which is heated in winter to a stove temperature; but it does not follow that it must be of a particular construction or arrangement; any house, whether it be a Pine stove, a Grapery, or a plant stove, or even a forcing pit, will produce Cucumbers in winter, where space can be found near the glass for a few pots. Let a little seed be sown early in autumn, or a few plants struck from cuttings, which will answer equally well. When they are about 6 inches high, procure as many pots, 15 inches across, as you have space for; perhaps that may be only a couple, but even from two pots an occasional fruit may be obtained. The next point is to have at hand some nice mellow loam of a turfy nature, in a rough state; all the fine soil should be screened out of it. With this mix one-fourth half-decayed leaves, and your compost is complete.

In potting, place a few large pieces of broken pots in the bottom of the pot, so as to secure complete drainage; then fill up with soil, placing the young plant in the centre, with the old ball about an inch under the surface of the new soil, which should be, when finished, about level with the top of the rim, as it will subside, and thus make room for a future dressing. When potting is completed, give the whole a liberal watering, using on this, as on all subsequent occasions, water at the temperature of 80°; the pots may then be placed in the positions assigned to them; and as the plants grow, the Vines must be carefully supported, and trained, in order that the light may get unobstructed to all parts of the plant.

The remaining grand point in the culture of Cucumbers is to keep them free from insects, such as thrip, mealy bug, red spider, and green fly. The usual remedies of fumigation, syringing, &c., must be resorted to; for should these pests ever be permitted to take possession, the plants may as well be thrown away. Let me, therefore, earnestly entreat those who may attempt the culture of Cucumbers on this plan, to keep their eyes open. I have been eating for the last 10 months fruit from plants treated in the manner I have been describing. *Pharo.*

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

FRIDAY, *Aug.* 2.—In the NATURAL HISTORY SECTION a paper was read by Dr. LANKESTER from G. Newport, Esq., on the *Reciprocal Relations of Vital and Physical Forces.*—This was of some interest, as indicating the direction that physiological inquiry is taking with regard to the relationship of vital to physical forces. The author stated that as early as November 1845, he had advocated in a paper read before the Linnean Society, and published in an abstract of that paper at the time in the "Athenæum" and *Gardeners' Chronicle*, views similar to those which had since been advocated by Prof. Matteucci, Dr. Fowler, and Dr. Carpenter. These views were considered by the Council of the Linnean Society as of too startling a nature to admit of publication without further evidence, and they had accordingly omitted all reference to the subject in Mr. Newport's paper as published in their Transactions. The report of the proceedings of the Linnean Society in the "Athenæum" and *Gardeners' Chronicle* was read to the section, as well as the original passage from the paper as presented to the Linnean Society. Some new remarks of Mr. Newport on the subject were subsequently read at the Physiological Sub-Section.—Dr. Carpenter stated that it frequently occurred that such was the condition of science that the same thought occurred to many observers at the same time. He freely admitted that Mr. Newport had preceded him in pointing out the correlation of vital and physical forces. It was due, however, to Dr. Fowler to say that 50 years ago he had prosecuted researches on this subject. There was, however, a great difference between the idea of the correlation of physical and vital forces and the mere hypothesis of their identity. The investigation of their correlations was likely to lead to important results. Mr. Grove had the merit of first appreciating the importance of studying the correlation of physical forces; but this was no less obvious between such forces as motion, chemical affinity, heat, light, magnetism, and electricity, than between these and various forces observed in the animal body, as the nerve force, muscle force, &c.

On Some Peculiar Bodies which occur in Aldrovanda vesiculosa, Utricularicæ, and other Aquatic Plants, by Professor PARLATORE, of Florence.—The author delivered his remarks in French. He drew attention generally to the condition of the tissues in submerged plants, and pointed out the regular character of the intercellular cavities in their various organs. He described particularly the forms assumed by those cavities in the genera Pontedera, Myriophyllum, Utricularia, &c. Although most frequently smooth around their walls, and very regular in form, they sometimes presented projections of various forms in their interior. This was especially the case in Nymphæa and Nuphur, where the projections assumed the forms of irregular compound hairs. Sometimes these bodies were scaly. In the cavities of Myriophylium crystalline bodies presented themselves.—Dr. Lankester remarked that crystals were not uncommon in the intercellular cavities of water plants. He had seen them very abundant in some species of Chara. In this case they were apparently carbonate of lime, and they were more abundant in proportion to the quantity of carbonate of lime contained in the water in which the plants grew. Bodies similar to those described by Professor Parlatore in Nymphæa and Nuphar existed in the air cells of Victoria regia.

Report of the committee appointed to investigate the subject of the Vitality of Seeds. By H. E. STRICKLAND, Esq.—The report stated that the committee had continued their labours, and a list of the seeds of various plants which had been planted, and which had been ascertained to have been kept from 5 to 50 years, was given. These lists are published in the Transactions, and will one day furnish materials for general conclusions with regard to the period of time for which seeds will retain their power of growth.—Dr. Daubeny said that the result of the experiments, as far as they had gone, went to show the fallacy of the opinion that seeds retained their vitality through long periods of time. The notions abroad on this subject were truly absurd. He had lately seen a Fern which a gentleman supposed he had grown from sporules obtained from a fossil plant from the coal measures. The committee had been greatly assisted by persons sending them old seeds to experiment upon; but generally the number sent was too few to be of value. As many as two or three thousand seeds should if possible be sent at a time.

In the MECHANICAL SECTION a communication was made *On a Register Hygrometer for regulating the Atmospheric Moisture of Houses*, by Mr. APPOLD.—This instrument, with a variation of one quarter of a degree in the hygrometric state of the atmosphere, opens a valve capable of supplying 10 quarts of water per hour, conveying it on to the surface of warm pipes covered with blotting paper, by which the water is evaporated until the atmosphere is sufficiently saturated, and the valve thereby closed. A lead pencil attached registers the distance the hygrometer travels, and thus a sheet of paper moved by a clock would show the hygrometric state of the atmosphere at any period of time.

MONDAY, *August* 5.—In the CHEMICAL SECTION a paper was read entitled, *Some Observations on the Growth of Plants in Abnormal Atmospheres*, by Dr. J. H. GLADSTONE and Mr. G. GLADSTONE.—Whereas oxygen is the most important constituent of the atmosphere, so far as animal life is concerned, it is upon the carbonic acid, ammonia, and aqueous vapour that the vegetable world is supremely dependent. The question arises, Does the oxygen and nitrogen of the air play no important part in the process of vegetation? The following preliminary experiments, with a view to the solution of this and similar inquiries, were detailed by the authors. A Pansy lived for the length of 24 days in an atmosphere of hydrogen, containing 5 per cent. of carbonic acid; one similarly placed in an atmosphere of common air remained healthy for a longer period. Five Onions just commencing to sprout were severally placed in carbonic acid, carbonic oxide, coal gas, air containing 8 per cent. of light carburetted hydrogen, and ordinary atmospheric air. The germination of the first two was entirely stopped; while the hydrocarbons appeared considerably to accelerate the growth of the vegetable. The plants in each instance lost weight. A Pansy in flower, a young Stock, and a Grass plant were placed in pure nitrogen gas. The former two soon died, but the Grass was left growing a month after the commencement of the experiment. Another Pansy was placed in a mixture of oxygen and hydrogen gases in the proportion requisite to form water. In order to imitate the balance that obtains in nature between animal and vegetable life, some flies were introduced, along with some sugar to serve as their food. The experiment was commenced a fortnight since, and the plant, when last observed, was in good condition. Owing to the low specific gravity of the mixed gases, the flies were unable to mount on the wing, or make the usual buzzing noise; but the substitution of hydrogen for nitrogen in the atmosphere, had no marked effect upon their breathing, thus confirming the observations of M. Regnault, by an instance drawn from the Articulata.

IN the GEOLOGICAL SECTION a paper was read *On a Tertiary Fossiliferous Deposit underlying Basalt in the Island of Mull*, by the Duke of ARGYLL.—The island consists of trap, granite, and mica slate, all of which are seen in the small bay near Ardtun, and at this place are some small veins of coals interstratified with columnar basalt. A little north of the bay is Ardtun Head, a perpendicular cliff of 130 feet, intersected by a deep fissure or ravine, accessible from the moor above. The cliff consists of the following horizontal beds:—1. At the top, 20 or 30 feet of rudely columnar basalt; 2. A thin laminated stratum containing fossil leaves; 3. Volcanic ashes; 4. A second leaf-bed; 5. A second bed of volcanic ashes; 6. A third leaf-bed; 7. Amorphous basalt; 8. Columnar basalt, occupying the base of the cliff. The volcanic ash-beds are undistinguishable from some modern formations at Vesuvius, and from the tuff at Madeira and Auvergne. The second leaf bed is 1½ to 2 feet thick, and in its lower part is a mere mass of vegetation. In the third bed the leaves are less numerous, and imbedded in a volcanic mud, which now forms a hard whinstone; the leaves are black and look charred, but this is not necessarily the case: no trunks, boles, or even small twigs were found. From these appearances the Duke concluded that the leaves had accumulated from autumn to autumn in a shallow lake, and had been overflowed by soft mud, in which they were preserved. The only indication of living animals found with the leaves was the track of a worm.—Prof. Forbes stated that the leaves were in a very beautiful state of preservation, and belonged to species of Plane, Alder, Pine, Equisetum, and some others. From the presence of flints the deposit appeared to be newer than the chalk, whilst in the latest tertiaries only vegetable

remains of a more boreal character were found. The leaves most resembled some eocene specimens from Styria, figured by Dr. Unger, and those found in the (eocene) pipe-clay beds of the Isle of Wight. Sir John Richardson had also discovered leaves of similar character at Mackenzie River, Arctic America. With respect to their situation, fossil leaves had been found in beds under basalt in Iceland; and Prof. Oldham had just mentioned to him, that he found vegetable remains and leaves in a similar situation in the north of Ireland, but neither of these cases had been examined or published.—Mr. J. Smith said that the only clue to the discovery the Duke had made was the accidental finding of a "stone that looked like a leaf" by a sportsman.—Mr. Sedgwick, referring to the idea that dicotyledonous leaves (unless coniferous) were unknown in secondary strata, said that he had found such in the green-sand bordering the Hartz mountains. The trap rocks of the Hebrides had been considered of older tertiary date by Buckland and Conybeare 30 years since.

Home Correspondence.

Nepenthes.—"Is Nepenthes Rafflesiana a stove or an Orchidaceous plant? At a late exhibition of the Coventry and Warwickshire Horticultural and Floricultural Society, it was shown and awarded the first prize, as an Orchidaceous plant. *A Constant Reader.*" [This is a marvellous discovery of the Coventry and Warwickshire judges. A Nepenthes an Orchid! What next? If there should be a cattle show, these judges would no doubt determine a pig to be a bullock.]

Iron Water Tanks.—I have need to apply a large, wrought-iron tank, capable of containing about 25 hogsheads, to the purpose of maintaining a supply of rain-water for the use of my garden and plant houses. From what has been suggested to me, I am led to ask whether the water (which may be more or less, according to the season and demand), is likely to be affected by the iron, so as to become injurious to plants of a delicate nature. And if yes, whether any, and if any, what means can be adopted to obviate all such ill effects? Requesting the favour of an answer through the medium of the *Gardeners' Chronicle*, I subscribe myself, what I really am, *A Taker-in of your Paper from the first Number to the present day.* [An uncoated iron tank will injure the water left in it. Perhaps water would stand in it without injury if the tank was well coated with pitch and tar, not coal tar. This is worth a trial.]

The Trentham Hybrid Melon.—I have ripened two crops of the above Melon on the same plant this year. The first crop consisted of seven fruit, the largest weighing 2 lbs. 14 oz., and the smallest 2 lbs. By the second crop I had six fruit, about equal in quality to those of the first produce. I have now another crop swelling fast. *H. B., Epsom.*

Large Produce of Potatoes from a whole set.—We dug here in the garden to-day (Sept. 16th), 22 lbs. of Potatoes, the produce of one set planted whole early this spring. They are all perfectly free from disease. The only way in which I can account for so great a produce, is that the set was whole, planted early, well moulded up, and not crowded by any other plant; hence the necessity of planting thinner than is usually done. I am of opinion that every one who has a pole of garden ground, ought to read Mr. Cuthill's essay on the Potato. *J. Rust, Chase-side House, Enfield.*

Pelargonium Galls.—This is a gardener's name for those curious excrescences which you have noticed at p. 579. They are familiar to most of us, more especially to those who grow the old-fashioned varieties, some of which are hardly a season free from galls; but, for my own part, I could never make out that they were either the cause or the consequence of ill health. The old Oak-leaved variegated Pelargonium, which is a sport from graveolens, is, of all the kinds I have seen, the most subject to them. Galls are produced on the roots and on all parts of this plant. I have been of opinion for a long time that this variegated plant first originated from one of these galls, although I have failed to get any of the galls to make buds, after trying them in various ways, and even splitting them thin, laying the pieces pressed on sand in pots, with and without glasses; still I think that I have seen a gall on the collar of a vigorous strong variety of the more recent seedlings burst into a shoot, and that the gall formed a dry burr round the shoot for a time. With this, however, I cannot charge my memory so as to be quite certain; but that I often failed with galls from different varieties, cannot be a mistake, for I made the last attempt as late as last June, with a gall which formed on a cutting of the variegated Oak-leaved Pelargonium; before it was rooted this gall had more matter in it than the cutting which produced it. It has occurred to me since I sat down to write this, that the best plan would be to cut off a slice from the top of the gall (as soon as the latter was observed) during the height of the growing season, still leaving the gall attached to the parent plant; thus, by arresting the efforts of the mass to extend onwards, we might force it to form buds on the edges of the cut part. This process seems feasible enough; besides, we have some analogous cases with leaves, bulbs, &c., on record. May it not be possible to obtain variegated Geraniums by this process? If so, we should have a proof at once of the old idea that variegation in the leaves arises from a diseased condition of the parent plant. *D. Beaton.*

The "Willmore Surprise" Pelargonium.—In a late Number is inserted an article from Mr. Beaton, respecting this Pelargonium, a representation of which is given at p. 515. Mr. Beaton says that he has a double-flowering Pelargonium more surprising than the Willmore. Now let us see in what Mr. B.'s more surprising plant consists. He says his seedlings repeatedly had from 6 to 9 petals, but never 10; this is nothing very different from Mrs. Willmore's plant, which has not less than 7, and sometimes 9 petals. But, it appears, that because Mr. B.'s plants did not produce 10 petals, they were destroyed as good for nothing; yet Mr. B. says he has saved one with 7 petals, "and a very beautiful bedder it will be." Is this the plant which is to be more surprising than Willmore's? I am very well acquainted with Mrs. Willmore's Pelargonium, and quite agree with you, "that it is a most desirable plant for bedding out;" and I can recommend it both on account of its brilliancy of colour and good habit. All I can say is, that, if Mr. Beaton will send forth a more surprising plant, I am sure the public will be thankful to him for it. Mr. B. has fallen into a mistake as to the owner of the plant. It does not belong to J. Willmore, Esq., of Oldford, but is the property of Mrs. Willmore, of the American Nursery, Strawberry Vale, Edgbaston. It is an accidental seedling, as is stated in the *Chronicle*, and was found amongst a bed of Hollyhocks, where it had stood the previous winter. *F. B. Westcott, Edgbaston.* [We have received a letter on this subject—for the most part a repetition of the above—from Mr. Cole, gardener to J. Willmore, Esq., of Oldford.]

Societies.

CALEDONIAN HORTICULTURAL, *Sept.* 5.—At this, which was the Fruit and Dahlia competition meeting, the following prizes were awarded:—Peaches: 1st, Mr. Crocket, gr. to Colonel Ferguson, for Bellegarde and Twyford; 2d, Mr. Campbell, gr., Alva House, for Red Magdalen and Noblesse. Nectarines: 1st, Mr. Campbell, for Newington and Elruge. Muscat Grapes: 1st, Mr. Fowler, gr. to Sir T. B. Hepburn, Bart., Smeaton; 2d, Mr. Ramsay, gr. to Sir G. Clerk. Black Hamburgh: 1st, Mr. Blair, gr. to Mrs. D. C. Durham, Largo; 2d, Mr. Addison, gr. to the Earl of Wemyss. Frontignan: 1st, Mr. Reid, gr. to Professor Syme, for a fine bunch of Black. Heaviest bunch of Grapes fit for dessert: 1st, Mr. Marshall, gr. to A. Croil, Esq., for White Syrian, weighing 4 lbs. 5 oz.; Mr. Fowler, of Smeaton, produced a bunch of White Syrian, weighing 4 lbs. 13 oz., but not being sufficiently ripe it did not receive a prize. Pine Apples: 1st, Mr. M'Connochie, Taymouth Castle, for a Ripley Queen, weighing 4 lbs.; 2d, Mr. Anderson, gr. to the Earl of Stair, also for a well-grown Queen. Apricots: 1st, Mr. M'Farlane, Lochend, for Moorpark and Breda; 2d, Mr. Thom, gr., Newton Don, for Hemskirk and Moorpark. Greengage Plums: 1st, Mr. Calder, gr. to Lady Harris; 2d, Mr. Sinclair, gr. to W. Campbell, Esq. Plums, other than Greengages: 1st, Mr. Anderson, for Victoria and Magnum bonum; 2d, Mr. Sinclair, for Washington and Orleans. Highest-flavoued Melon: 1st, Mr. Thomson, gr. to Mrs. D. C. Durham, for Irish Green-fleshed; 2d, Mr. Reid, for Henderson's Green-fleshed. Heaviest twelve Jargonelle Pears, fit for immediate use: 1st, Mr. Addison, Gosford; 2d, Mr. Gilmour, Mary Cottage—the latter being the heaviest, but not quite ripe. The display of Dahlias was excellent: Nurserymen's Class, 1st, Messrs. Dickson aad Sons, for Crocus, Mrs. Seldon, Cleopatra, Duke of Wellington, Magnificent, Yellow Standard, Miss Spears, Duke of Cambridge, Knight of Nova Scotia, Thames Bank Hero, Marchioness of Cornwallis, Sir F. Bathurst, Mrs. Anderson, Standard of Perfection, Grenadier, John Edwards, Purple Standard, and Princess Radziville; 2d, Mr. Handasyde, for Purple Standard, Queen of Primroses, Grenadier, Duke of Wellington, Queen of Lilacs, Toison d'Or, Sir F. Bathurst, Crocus, Shylock, Madam Henrietta, Lily White, Mrs. Seldon, Yellow Standard, Frederick Jerome, Buffalo Girl, Elizabeth, and Queen of Sheba. Practical Gardeners: 1st, Mr. Young, gr. to Mrs. H. N. Ferguson, for General Negrier, Fearless, Purple Standard, Mrs. Seldon, Snowflake, Grenadier, Duke of Wellington, Elizabeth, Captain Warner, Yellow Standard, Sir F. Bathurst, and Marchioness Cornwallis; 2d, Mr. Oswald, Murthly Castle, for Crocus, Purple Standard, Knight of Nova Scotia, Shylock, Marchioness Cornwallis, Caractacus, Mrs. Seldon, Grenadier, Boule de Feu, Duke of Wellington, Beeswing, and Frederick Jerome; 3d, Mr. M'Donald, gr. Drummond Castle. Amateurs' department: 1st, Mr. King, Inveresk, for Caractacus, Duke of Wellington, Sir F. Bathurst, Purple Standard, Shylock, and Beeswing; 2d, Mr. Paton, Whitehill, for Beeswing, Crocus, Grenadier, Marchioness Cornwallis, Duke of Wellington, and Shylock. Fancy Dahlias: 1st, Mr. M'Donald, Drummond Castle, for Rainbow, George Clayton, Adolphe, Hermione, Surprise, and Jenny Lind; 2d, Mr. Currie, gr. to Miss Wedderburn, Inveresk Lodge, for Miss Blackmore, Christmas Box, Keepsake, Dr. Horner, Oillet Parfait, Rainbow, Miss Jane, Miss Stephens, Mr. Shaw, and General Cavaignac. Best four spikes of Hollyhocks: Mr. White, gr. to J. Russell, Esq., for Model of Perfection, Elegans, Napoleon, and Rosa grandiflora; 2d, Mr. Pow, gr. to A. Berwick, Esq., for Napoleon, Lady Clerk, Mrs. Berwick, and Robert Hunter. Pentstemons: 1st, Mr. Currie, for Giganteus elegans, McEweni, Gentianoides splendens, Murrayanus, La Polka, and Buckii; 2d, Mr. Munro, gr. to J. Marshall, Esq., for Buckii, Gentianoides, Watterstoni heterophyllus, McEweni, and Gentianoides coccineus. Phloxes: 1st, Mr. Kerr, gr. to R. Brown, Esq., for Purpurea perfecta, Aspasia, Imbricata, Elegantissima, Richardsoni, and Antagonist; 2d, Mr. Currie, for Princess Galitzen, Downiana, Amanda, Gerard de St. Trena, Purpurea perfecta, and Elegantissima. Vegetables: Mr. Pender, gr. to D. Anderson, Esq. Productions not intended to compete for prizes, for which thanks and honorary awards were voted, according to circumstances: Thanks to Messrs. P. Lawson and Son, for Roses, Dahlias, Marigolds, and Greenhouse Plants; to Messrs. Dickson and Co., for Hoya bella, Cyrtoceras reflexum, and other plants; to Messrs. J. Dickson and Sons, for Dahlias, Lilies, Fuchsias, Heaths, and other plants; to Messrs. Ballantyne and Sons, for Hollyhocks and Marigolds; to Mr. Mackintosh, for a fine Lilium and Hollyhocks; to Mr. Stark, for Pentstemons Murrayanus and heterophyllus, and Dahlias, Hollyhocks, Fuchsias, and Verbenas; to Messrs. Downie and Laird, for Hollyhocks; to Mr. Handasyde, for fancy and other Dahlias; to Mr. Methven, for two seedlings of Azalea pontica, and a specimen of Lilium lancifolium; to Mr. Kelly, for Tritonia aurea, and blooms of Hollyhocks and Dahlias; to Mr. Howie, for specimens of Borecole; to Mr. Robertson, for Pansies; to Sir W. Gibson-Craig, Bart., for a dish of Hampton Court Morello Cherries, of superior quality; to Professor Dunbar, for exotic plants, including Stanhopea insignis, Fuchsia Coralina, Heaths, and Lilies; to Mr. M'Connochie, for samples of Monro's green-fleshed Melon, Blackhall's green-fleshed, and Queen Anne's Pocket Melon, together with two Moscow Pines, and one Ripley Queen, for which an honorary award was made for superior cultivation; to Mr. Pender, for fruit, Erica ampullacea, and several Japan Lilies; to Mr. Low, for a floral device; to W. Waddell, Esq., for German Asters and Marigolds; to Mr. Foulis, for Hollyhocks and Picotees; to Mr. Anderson, for Peaches and Nectarines, from a flued wall; to Mr. Aitken, for a basket of large Onions, treated with a preparation of gas tar; to W. T. Thomson, Esq., for Dahlias; to Professor Syme, for White Frontignan Grapes; to Mr. W. Melville, for Champion Black Hamburgh Grapes; to J. Mood, Esq., for Asters and Dahlias; to R. Girdwood, Esq., for Mimulus moschatus grandiflorus, and three Seedling Petunias; to Mr. Young, for Dahlias; to Mr Marshall, for French and African Marigolds; to Mr. Stenhouse, for Marigolds; to Mr. Scrymgeour, for German Asters and Marigolds; to Mr. Grieve, for two Seedling Pansies; to Mr. Nicoll, for Verbenas, Hollyhocks, and Marigolds; to Mr. Finlayson, for a Seedling Pansy; to Mr. M'Farlane, for a Spanish Capsicum; to Mr. Gordon, for a Seedling Hollyhock, and a stand of French Marigolds; to Mr. Burns, for Hollyhocks; to Mr. Anderson, for Frontignan Grapes, from a Vinery, the outside border of wnich was renewed in December, 1849; to Mr. H. Craigie, for Jargonelle Pears and Plums; to T. Hutchison, Esq., for African and French Marigolds; to Mr. Sinclair, for autumn and spring-sown Onions; to A. Richardson, Esq., for Lilium lancifolium speciosum, and Œnothera taraxifolia; to Mr. Gilmour, for Jargonelle Pears; to A. Roughead, Esq., for four large Gourds; and to Mr. Causey, for three ditto.

At this meeting several new members were elected.

Reviews.

Nurserymen's Lists for 1850.

THE most remarkable of these, and probably the best that has yet been seen, is the *Synopsis of the Coniferous Plants grown in Great Britain, and sold by Knight and Perry*, a small quarto of 64 pages. In this work, for it is more than a trade catalogue, are comprehended numerous details concerning the genera of Conifers, and the species or varieties included under them. By many of their customers these details will no doubt be read with interest. Like the catalogue of Conifers now publishing in the Journal of the Horticultural Society, this is founded upon Endlicher's "Synopsis," with such deviations as have been suggested by the authors' experience. The two lists will, however, be found essentially different, especially in the distribution of the Firs. Messrs. Knight and Perry recognise the genera Picea, Larix, and Cedrus, which Endlicher and, after him, the authors of the Horticultural Catalogue altogether object to; the latter indeed refuse to admit such genera even as sectional divisions. The fault of this, as of all nurserymen's catalogues, is that the greatest possible extension of names is an admitted principle; and varieties are recognised which are of no interest or importance even if they exist. Thus under Cedrus, we have first, *Cedrus Libani foliis argenteis*, the Silver Cedar; and then comes *C. elegans*, which is the same thing, and which is also the *Cedrus atlantica* of Manetti and Endlicher.

The catalogues of plants sold by *Mr. Hosea Waterer*, of Knap-hill, and *Mr. John Waterer*, of Bagshot, are not merely rich in American plants, but offer a great diversity of other hardy ornamental species. The first is the most complete, and represents a more extensive stock than the second. Both deserve to be consulted by the purchaser.

Messrs. Paul, of Cheshunt, have issued their priced Catalogue of Hardy Ornamental Trees and Shrubs, forming a seventh division of their list; the six others can be had separately.

We have also before us "A Descriptive Catalogue of Garden Seeds, cultivated and sold at the Wethersfield Seed Garden (Connecticut), by *Comstock, Ferre, and Co.*" This is a little, but useful dissertation on practical gardening, as well as a trade catalogue. It is more indeed the former than the latter, for, strange to say, we cannot find a *price* given from one end of this list to the other; it would seem that mere price cata-

logues are distributed separately. The following account of the Squash will serve to show how this American catalogue is got up :

"Squash (Fr. *Courge*.—Sp. *Calabaza*).—The Squash is a native of warm latitudes, and may be divided into summer and winter, bush and running varieties. Being all very tender and sensitive of cold, they cannot with safety be planted in the open ground before the middle of spring. The hills should be manured and prepared the same as for Cucumbers, and all sorts thinned to two or three plants in a hill. *Early Yellow Bush Scollop.*—An early, flat, scollop-shaped variety, of a deep orange yellow, and smooth skin ; used when young and tender for boiling, and at maturity for making pies. *Early White Bush Scollop.*—Similar in shape to the yellow ; light cream-coloured. It grows to larger size, of a coarser quality, and is a little later ; more grown at the south than any of the others. Both varieties are called Patty-pan in the Middle States, where all the summer sorts have the local name of Cymlings. *Early Bush Summer Crookneck.*—The richest and best sort for summer ; very early and productive. It is small, crooked necked ; covered with warty excrescences (the more warty the better) ; colour, bright yellow ; shell, very hard when ripe. It is used only when young and tender, which may be known by the pressure of the thumb nail through the skin. These three sorts should be planted 3 feet apart. There are yellow, white, and green running varieties of nearly the same shape, but they take up too much room to be allowed a place in a common garden. *Green Striped Bergen.*— This is cultivated to considerable extent for the New York market. It is small, bell-shaped, and striped with dark green and white ; a bush variety of strong growth, requiring to be planted 4 feet apart. Used both green and ripe. It does not produce great crops, but is quite sure to ripen in the coldest seasons. *Vegetable Marrow.*—This is intermediate between the Pumpkin and the Squash, used mostly when young and tender, like the summer Squashes, but is inferior to any of them. Fruit, long oval, very fleshy and succulent ; colour, light yellow. There are different coloured varieties. Plant 6 feet apart, on account of its running habit. The English make great use of it. *Fall, or Winter Crookneck.*— The kind most generally cultivated in New England, for fall and winter ; necks, long and solid ; colour, pale yellow, the deeper the colour the better. There is a striped variety of the same quality, with which this is usually mixed. It yields well, and is excellent for pies ; valuable also as a farm crop for feeding hogs and cattle. *Canada Crookneck* is a small early variety of the above, that bears well, and is by many esteemed preferable. From their running habit, these two last require to be planted 6 feet apart. *Autumnal Marrow.*—This is the most popular kind in the Boston market. Form, ovate, pointed ; skin, extremely thin, bright orange or salmon-coloured ; flesh, deep orange, finely grained, and excellent flavoured ; seeds large, white. Average weight, 6 or 8 lbs. It keeps well in winter, and will boil as dry as a Potato. Plant 8 feet apart. The very best. *Lima Cocoa-nut.*—A large, long, blue Squash, very fine grained, and sweet ; seeds, white ; very late, but if well ripened will keep till spring ; esteemed for boiling dry. Plant 8 feet apart, and leave but two plants in a hill. The varieties of the Squash are so numerous, and they intermix so easily, that it is very difficult to preserve each pure. The rage for mammoth Squashes we hope has gone by ; they are always coarse grained and watery, only fit for stock feeding. Small and medium sized Squashes are uniformly finer grained and richer flavoured."

Miscellaneous.

An Invalid's Garden.—I am, and have been for years, a great invalid, and am passionately fond of flowers, though unable to enjoy their beauties out of doors, and am therefore confined to those which I can tend in my windows. Whilst endeavouring to while away many weary hours, the thought has frequently been forcibly impressed upon my mind, that an immense increase of recreation and pleasure is yet within reach of sufferers like myself. It may be visionary, yet I assure you, I have dwelt on my plan with the most delighted feelings, and pictured in my mind's eye a perfect little paradise of flowers. The late measures of Government, in removing the duty on bricks and glass, will now enable even me to attempt what I have long only thought of. My plan is simply this : to have built a span-roofed pit, covered with thick rolled glass, which is not much dearer than slates ; and on each side to have a bed, if I may so call it, heated by hot water (to be used only when required) ; the surface of the bed to be of sheet iron, painted and vulcanised, or undergone some process to prevent rust. In this iron I would have a series of circles cut, into which I would fit earthenware vessels, like seed pans, with ornamented margins, and arranged artistically. Now, would it not be possible to have these pans filled with beautiful flowers ? and, to keep up the beauty of the place, as the flowers went out of bloom, might not the pans be lifted, and others, from a reserve garden, substituted ? Could not one pan have scarlet Verbenas, pegged down so as to make a mass ? another white, and so through all the various shades ? Could there not be some filled with Gladioli, Ixias, Achimenes, &c. ? Could there not be circular masses of Crocuses, Hyacinths, and flowers of a similar character, for spring ? These might be succeeded by scores of other things, and why not thus have a miniature flower garden ? Here could the effect of combination and contrast of colour be carried out, affording information of the most interesting kind ; and here could I, or any other invalid, secure from draughts and damp, tend these beautiful offsprings of Nature, and though debarred from the enjoyments which many others have, here we could, in thankfulness, look from Nature up to Nature's God. How beautiful would be masses of Russian Violets, the lower sorts of Calceolarias, Campanulas, Mimuluses, and every other plant that is used for bedding. Then I would have wires stretch over-head, on which might hang in festoons the Maurandya, Calempelis, Passiflora, &c. I would have no single plants, except the climbers ; and the others should be so planted as to fill their respective pans or beds. Now, do you not think my plan possible ? and would it not be very beautiful ? *I. F., Manchester.* [We like the idea much, and if well carried out it would indeed be beautiful. *Midland Florist.*]

Cecidomyiæ of the Willow, Rose, and Rock-rose.—It has recently been discovered by the German naturalists, that several of the galls which the Cynipides originate upon the leaves of trees produce two different forms of gall-fly ; it has not however, so far as I am aware, been remarked, that the galls formed by the dipterous Cecidomyiæ may in like manner be colonised at one and the same time by distinct species. The rose-gall upon the summits of Willow shoots has attracted the attention of most observers, and De Geer has briefly indicated the fly (Cecidomyia salicina), which he reared from the red larva which occasions it, as black with brown wings. During the present spring I met with one of these productions upon the Salix cinerea, tenanted by about 8 or 9 pupæ, which became flies on the 22d of May, and these were at once seen to be not all of one species. The smallest and most numerous had the wings dusky and very pubescent, with the antennæ 17-jointed in the male and 16-jointed in the female, and were from ¾—1 line long, and the expanse of the wings 2 lines. The second, of which I only obtained a single male, was considerably larger, had the antennæ 22-jointed, the wings ample, clear, with only a few scattered hairs. Length 1½ line, expanse of the wings 4 lines. I have not been able to identify these with any described species, and have named the first C. saligna, and the second C. Cinerearum*. The Cecidomyia Salicina of De Geer, according to Macquart's account, has about 20 joints in the antennæ, and has the wings hairy and slightly obscure. Length 2 lines. The woody oblong gall of the Willow likewise produces a Cecidomyia, which I venture to term C. Gallarum-Salicis. If I mistake not, from an examination of dried specimens, the antennæ are 20-jointed in the male and 19-jointed in the female, and the wings are slightly dusky and grayish pubescent. The length is 1½ line, and the wings are 3 lines in expanse. Bouché, on the other hand, describes from this gall an insect which he likewise designates Cecidomyia Salicina, as 1 line long, with brown wings. There is thus a great confusion of synonyms on this topic, and it is possible from the observations which I have just recorded, that this may have arisen from insects really distinct having passed under the review of different observers. Mr. Westwood has recently brought forward another species found in the young twigs of Salix viminalis and S. rubra. This he names C. viminalis, and in it the antennæ are 17-jointed in both sexes, and the wings are colourless, with the hinder margin strongly fringed. I have also recently remarked an instance of two species of gall-midges acting in concert on Roses. The leaflets of various wild species of these are tenanted in the centre by companies of larvæ which cause this part to thicken and blister on each side of the midrib, and the leaflet being thereby prevented from expanding, protects, as if in a pod, the little community. These larvæ have the characters of those of the Cecidomyiæ, viz. are spindle-shaped or subelliptical, only slightly convex, with distinct sub-compressed lateral margins, the head end attenuated to a point, with a pair of horn-like bristles behind it, a dusky spot visible above and beneath, and a dagger-shaped polished mark on the fore-part of the breast ; and the hinder end is sub-truncate, slightly tuberculate. The most numerous is orange mottled with yellow ; and the other is white, smoother, more minute, with the hinder apex tri-tuberculate : both are sparingly bristled across the segments. The first is scarcely distinct from another yellowish grub often found on the underside of the leaves of garden Roses affected with mildew, which appears to be engaged in devouring the minute fungi in which the disease consists. They descend into the soil to undergo their changes, and I doubt if I shall succeed in rearing them. About the time of their first appearance, however, I met with two species of Cecidomyiæ frequenting the infested Rose bushes, of which one, C. Rosarum, was occupied in depositing its eggs in the unopened leaflets. They are both undescribed species, and till the contrary is proved, I shall assume that they are the parents of the grubs in question. *J. Hardy, Penmanshiel, in the Annals and Magazine of Natural History.*

Chinese Dahlias.—Some 30 or 40 years since, before Mr. Chater's time, Chinese Hollyhocks took well-merited precedence of all other Hollyhocks. Now I see by the advertisements of Messrs. Turner, Youell, and others, that Chinese Chrysanthemums of a foot high are to elbow their somewhat intractable predecessors out of the greenhouse into the borders. And truly there are few flowers that need dwarfing so much as those. But is it that these diminutive species are really natives of the Celestial Empire ? Or is it not rather that the national epithet has come to be identified with any duodecimo edition of an ordinary plant, from the singular power that most singular of people have from time immemorial exercised over forest and orchard trees ? I myself once succeeded, by the bye, in obtaining an Apple tree with four full grown ripe Apples on it, though it was only about as many inches high. That, however, died before the next season. But to return. Why should we not have Chinese Dahlias ? It may interest some of your readers to know that I have accidentally found there is no difficulty in having plants to flower, and very tolerably in character too, when the blossom is many times the size of the whole plant. About six weeks ago, when thinning the shoots of my Dahlias, I thought I might as well strike one of each, as, if they did not flower this season, they might make a duplicate collection of tubers for some friend. By putting them in a cold frame till the callus was formed, and then subjecting them to heat, they readily rooted ; and there they are still in sixties, from 1 to 3 inches high, with the pots full of roots, and waiting to be planted out. But two of them when taken had buds formed, which I did not cut off ; and now I wish I had taken none but such as had buds ; for I think it would have attracted notice, even at Worton Cottage, on a Wednesday, to see on the table a bloom of Captain Warner or of George Clayton, if not exactly fit for a specimen bloom at an exhibition, yet still in very fair condition, on plants respectively 1½ and 2½ inches high. Probably I am now too late ; but I have in consequence just taken off several tops with buds where they could be spared, simply for the sake of the curiosity ; and if they come to anything worth notice, I will inform you. *Iota, in Beck's Florist and Garden Miscellany for September.*

Mitcham : its Physic Gardeners and Medicinal Plants.—More than 2000 years ago the physicians of Greece were supplied with herbs, of which their Materia Medica chiefly consisted, by a class of persons called ῥιζοτόμοι (rhizotomi or root-cutters), who occupied themselves with the collection and sale of roots and herbs. They are mentioned by Theophrastus in connexion with the φαρμακοπώλαι (pharmacopolæ or pharmacopolists). Most of them were illiterate and superstitious, and ascribed magical virtues to the roots and herbs which they collected. Among the Romans these cullers of simples were termed herbarii (herbarists), and, if we are to believe Pliny, they were a sad set of knaves. At the present day, and in our own country, the ῥιζοτόμοι of the Greeks and the herbarii of the Romans are represented by a class of persons called simplers, who go about the country collecting those medicinal herbs which grow wild, and the demand for which is insufficient to induce the dealers to cultivate them. The plants thus collected are sold chiefly to the herbalists, by whom the profession and public are supplied. But those medicinal plants for which there is a sufficient demand, and which can be grown in this country, are cultivated in physic gardens or physic grounds, by persons called physic gardeners or herb growers. Although the cultivation of medicinal plants is carried on in various parts of England, yet more land is employed in this way in Surrey than in any other county ; and by far the greatest part of our physic grounds lie in the parish of Mitcham and its neighbourhood, about nine miles from London. The soil of this place is a rich black mould. The cultivation of physical plants at Mitcham commenced about a century ago. Lyson, who wrote in 1796, says, that 40 years before his time there were only a few acres employed in the cultivation of medicinal herbs in this parish ; whereas, at the time he wrote, about 250 acres (of which 100 acres were devoted to the cultivation of Peppermint), were occupied by physic gardeners. At the present time more than 800 acres are devoted to the cultivation of medicinal herbs at Mitcham, Merton, and Carshalton. About 1768 or 1769, Mr. Potter began the cultivation of physic plants at Mitcham. He was succeeded by his relative, Mr. James Moore, who furnished Mr. Malcolm with the information contained in his work relating to the medicinal plants cultivated at Mitcham. The following are the names of the principal growers at the present time, with the number of acres of land each person has under cultivation, and the number of stills in use :

Growers' Names.	No. of Acres.	No. of Stills.
Mr. Moore...	350	5
,, Arthur	300	3
,, Martin	40	3 not much used.
,, Newman	40	1
,, Sprules	50	2
,, Weston	40	0
	820	14

Several other growers cultivate a few acres of land. A considerable number of medicinal plants are cultivated at Mitcham. Among the most important of these may be mentioned Aconite, Chamomiles, Belladonna, Elaterium, Liquorice, Henbane, Lavender, Spearmint, Peppermint, Roses, Poppies, Savine, Violets, Angelica, stinking Orache, Caraway, Foxglove, Lovage, Elecampane, Marshmallow, and Hemlock. The principal part of the growers cultivate only Peppermint and Lavender, and some a few Chamomiles. Mr. Arthur grows rather a larger number of plants than any other. *Pharmaceutical Journal.*

On the Odoriferous Principle of the Leaves of Angræcum fragrans.—The leaves of Faham, known also by the name of Fahon or Fahum leaves, are imported from the Mauritius ; they are obtained from a plant first described by Dupetit-Thouars under the

* Cinereæ, a sectional term applied by Mr. Borrer to the Sallows.

name of Angræcum fragrans, belonging to the Orchideæ. Like many of the exotic orchids, the Faham is parasitic. It is a charming plant, and much sought after by the Asiatics on account of its fragrance. It is sufficient to touch the fresh leaves for the fingers to remain impregnated with their aroma. The dry leaves, which occur in commerce, have an odour which considerably resembles that of the Vanilla, belonging to the same family of plants. Alchol and æther separate the aromatic principle; boiling water removes a slightly bitter principle and a mucilaginous substance, besides the aroma. In the country whence they are derived, and even in France, a very agreeable tea is prepared from them, which is used as a digestive, and even recommended in diseases of the respiratory organs. Mixed with ordinary tea, they impart to it an extremely agreeable perfume. *M. Gobley, in the Chemical Gazette.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

In addition to making this department as gay as possible at this season, attention to cleanliness and order should be rigorously enforced, as the time is drawing near when this will be looked to as a principal means of affording gratification and enjoyment, in lieu of that which is rapidly disappearing from the open flower garden; and when attention is concentrated more exclusively upon the plant-houses, anything which is untidy or out of order, will the sooner attract notice. Some nice good-shaped plants of hardy Rhododendrons, Azaleas, Kalmias, &c., which are well supplied with blossom-buds, should be taken up, potted, and plunged in a bed of ashes, from whence they can be brought forward in succession as they are required. Roses, in pots, for winter use, should be examined, and any that require re-potting or top-dressing should be immediately attended to; a little stimulus in the way of rich soil will encourage the progress of their roots, and prepare their buds for a healthy and vigorous expansion. Attend to the staking of Chrysanthemums, and stimulate their growth by occasional waterings of liquid manure. Let them be fully exposed to the sun; but in this situation they must be carefully attended to with regard to water, or they will lose their lower leaves. Remove all suckers as they appear. Encourage the growth of Cinerarias, Primulas, Calceolarias, &c., by re-potting them, as often as they require it, into light rich soil, and give them every other attention calculated to ensure a strong sturdy growth.

FORCING DEPARTMENT.

Vineries.—Admit a free circulation of air through these houses, and attend vigorously to the destruction of insects by the ordinary appliances. Keep the atmosphere as cool as possible, where the wood is ripe, or nearly so; and in all cases stop the growth of laterals, even where a warm temperature is of necessity kept up, for the purpose of ripening the crop; as the leaves, produced during this month, cannot possibly attain a perfect development sufficiently early to repay the amount of stored up sap, which they have consumed in their formation. Where the fruit is not yet fully ripe, a brisk temperature must be maintained, as the keeping properties of the fruit depends on their being matured before the end of this month. Pineries.—Encourage the growth of successions by abundance of heat and moisture, as long as the strength of daylight and the fine autumn sun will sanction such a course. Let the bottom heat range from 84° to 87°. Continue to shift any that need it, or that are required to furnish the necessary succession, and place them under the most favourable circumstances of top and bottom heat, shade, and moderate moisture, until they have begun to make roots into the new soil.

FLOWER GARDEN AND SHRUBBERIES.

If it is intended to take up any of the plants from the open garden, and preserve them for filling the beds another season, it should be done early, that they may have time to start fresh before winter. The lifting will generally be confined to any new or very choice plants, of which there is not a sufficient stock of young ones; and to scarlet Geraniums, which produce flowers more abundantly upon old plants than upon young ones. The latter should be taken up, pruned to within one healthy joint of the old wood, and planted close together in pots or boxes. They should be placed in a moderately warm greenhouse, on a frame of the same temperature; and if the soil is moderately moist at the time of potting, water should be withheld till they have commenced to form new shoots and roots. Other beds may now be cleared of their occupants, wherever these are getting shabby or untidy in their appearance. Gather seeds as they ripen, and give due attention to mowing, cleaning, weeding, rolling, &c. If short moderately hardened shoots of Hybrid Perpetual and Bourbon Roses are taken off at their junction with the preceding growth, and placed in a slight bottom heat, they will strike root easily, and if potted off into rich soil, will come in admirably for flowering in pots during next spring or the following winter. It is now high time to plant spring flowering bulbs, and the ground intended for them should be immediately cleaned and prepared by making it light and rich. The soil in which they flourish most beautifully consists of a highly enriched sandy loam. A more cheerful appearance may be given to the beds by interspersing them with some plants of the hardy Primrose or Polyanthus, or with small plants of Erica carnea from the reserve garden. These flower at the same time, and may also be returned to the reserve garden in April or May next. Many of the early flowering herbaceous plants are in a dormant state, and if it is wished to remove them to other than their present situations, or if it is desired to increase the stock by division, this is an excellent time to effect these objects, as they will commence rooting immediately, and will have to establish themselves before the ground is locked up with frost.

FLORISTS' FLOWERS.

The continuous dry weather has rendered it imperatively necessary to give copious waterings to Carnation and Picotee layers. Many will now be sufficiently rooted to detach from the parent plant, and we would recommend immediate potting. The soil or compost should not be rich, rather a stout turfy loam, with a fair proportion of river sand, will be found suitable. A pint pot will be sufficiently large for a pair of layers. After potting, they may be placed in a cold frame, shut close for a few days, till the plants have again struck, when they may gradually be inured to the open air, keeping them carefully watered, and sheltered from heavy rains. Now get in the compost for the best Tulip bed. Rounding it up, we would recommend mats to cover it in the event of heavy rains, for though the early part of November is the usual time for planting, still should the weather be suitable, and the state of the bed permit, we would get the bulbs in the latter end of October. Pinks.—The soil has of late been much parched, and watering between the plants will be necessary. Put out seedlings for next year's blooming; plant in rich soil. Polyanthuses.—Keep free from weeds, and remove flower stems, which tend at this season to weaken the plants unnecessarily.

HARDY FRUIT GARDEN.

Wall Trees.—Any over-luxuriant growth should still be pinched, to prevent any excess of growth in one part of the tree, to the injury of weaker branches. In late situations, Peaches will continue to grow for some time after this, especially if the season should prove wet; and to prevent this, when such a tendency has been observed, we have often at this season cut trenches round the trees immediately after the fruit has been gathered from early kinds. The trenches should be cut at distances proportioned to the size and age of the trees; and all the strongest of the roots cut back with a knife, to check any exuberant growth, and to promote the ripening of the wood. This plan has answered fully. The cut roots soon emit new fibres, and the trees improve amazingly by it. Our borders being concreted below, enables this operation to be more readily performed than it could be if the roots were allowed to descend deeply into the subsoil. The late Peaches cannot be root-pruned till after the fruit is gathered; but all that require it should be attended to as soon as circumstances will permit. The best way to protect fruit from wasps is by means of the hexagonal gauze net, as formerly recommended.

KITCHEN GARDEN.

Any crops of Potatoes still remaining in the ground should be got up without delay, carefully sorted, and slightly sprinkled with quick-lime, or the caustic ash produced by charring or burning refuse; a good plan to ensure perfect dryness is to fill up the crevices between them with dry charcoal dust, which will absorb any moisture exhaling from the Potatoes. But as this does not prevent their heating, we prefer to keep them as dry and cool as possible, by passing a current of air through them. Avoid the too common large heaps, in which the Potatoes become very hot, and are much more likely to become diseased. The best way is to store them in small heaps, containing from eight to twelve bushels in each; and, as an additional precaution against their heating, a few draining pipes may be laid round the edge, pointing towards the centre, by which air will be admitted on all sides; and the egress of the vapour may be provided for by fixing a single pipe upright in the centre of the heaps. They should be formed on the surface of a dry piece of ground, which is much better than to dig pits for them. They should at present be only partially covered, laying over them sufficient straw and soil to exclude and throw off the rain, but deferring their frost-proof casing of soil till the nearer approach of winter. In addition to the rows of Parsley planted at the foot of the south walls, a few boxes should be filled with some carefully selected plants of extra curled, to afford a supply in extraordinary cases during winter, when deep snow or other causes prevent access to the plants in the open ground. The boxes will stand under the trellis of a Peach-house or some other cool place during winter. At the same time a few boxes should be filled with Tarragon and Green Mint, to force into leaf during winter and spring. In very cold localities a frame, or a few handlights, should now be devoted to the raising of small Salads for late autumn use.

State of the Weather near London, for the week ending Sept. 19, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 25th, 1842—therm. 82 deg.; and the lowest on the 27th, 1828—therm. 24 deg.

Notices to Correspondents.

Beet-root: *H B.* The roots of Beet which has run to seed are only fit for pigs—if they can be coaxed into eating them. If you mean that the roots are only producing flower stems, then the roots may be given to cattle: they are not fit for table.

Books: *M X.* Lowe's "Primitiæ of the Flora and Fauna of Madeira" is the only book that relates to the subject. You had better procure Lindley's "Natural System."—*R D.* Dr. Lindley's "School Botany."

Emigration: *C E.* If you have 30*l.* at your command, emigrate by all means, South Australia is a good colony, and if your medical men recommend it, we would advise you to go there, or you might take Nelson in New Zealand. However, rather abide by the advice of your friends.

Foreign Fruit: *T H.* The Nespres japonica is Mespilus (alias Eriobotrya) japonica, a well-known Chinese fruit tree. It is hardy in the south of England, but requires a greenhouse in this part. It will fruit then with the same treatment as an Apricot. The Chinese call it Lo-quat.

Fruit Trees: *A B* "Having lately seen an immense crop of fruit where the border is raised high, considerably above where the trees are grafted, wishes to know whether it is healthy treatment; or, if it encourages fruitfulness?" In general it is not advisable to raise the soil higher than to cover that part of the stem which had been originally under ground. Burying the stem above the graft is not conducive to fruitfulness, in the first instance; but after the tree has commenced bearing, the crop may be better supported in some cases. For example, Pear trees brought into early bearing on the Quince stock, and then earthed up, so that the Pear stem could strike root, are better able to support a weighty crop than would be the case if fed by the Quince alone.‖—*E T C.* For succession in your late Vinery, you may plant Black Hamburgh, White Muscat of Alexandria, Black Morocco, Calabrian Raisin, and two West's St. Peter's. In your Peach-house Noblesse and Bellegarde, in front; Royal George and Grosse Mignonne, at back. You may train a Vine up every third rafter, and succeed tolerably well, as others have done; but Peaches cannot have too much light. The sale by auction, to which you allude, was that of the Stanwick Nectarine; it will suit your purpose.‖

Insects: *Y, Bucks.* With a tree so large as your Weymouth Pine, we know of no other plan to get rid of the aphides than constant syringing with a garden engine. *W.—Imago.* Your larva, which feeds on the green aphides, is that of one of the lace-winged flies (Chrysopa perla). *W.—T H.* We found no insect in or about the Rose twig, but from its appearance and your description it seems to have been a small mite, and not a caterpillar. We cannot determine nor suggest a remedy without seeing a specimen. *W.—A M P G B.* The grubs found at the roots of the Turnips are the caterpillars of a moth (Agrotis segetum). Hand-picking by children is the only remedy against the present, and defence against next year's attacks. *W.—T W T.* The insects which infest your granary are the common weevil. It has been found that 130° to 140° of heat (according to Fahrenheit), will destroy them. Constant shifting of the grain also stops their propagation, and white-washing the granaries is also very objectionable to them. *W.—C.* The Bean stalks sent were found to contain the small horny empty cocoon of a two-winged fly, like that of Musca pumilionis. We have not before heard of this being the cause of so large an amount of injury, and shall be much obliged for a further supply of specimens and particulars. *W.—T C.* Next week. Please to send better specimens, and properly pinned. *W.*

Maize: *W K and A P.* Thanks; it is under examination.

Monstrous Cucumber: *Lackington Rectory.* Pray do: we shall be very curious to see it.

Mushrooms: *A H E.* There can be no doubt, according to all received notions on such matters, about the goodness of your Mushrooms. If they cannot be eaten with impunity it would be better to abstain from all except those which are cultivated, a course generally adopted at Paris. We do not quite understand whether the specimens you have sent are similar to those which were supposed to be fatal at Bristol. Perhaps you will kindly give us this information.

Names of Fruits: *E B E.* 1, Newington Nectarine; 2, Violette Hâtive do. Plums: 1, Cooper's Large Red; 2, Coe's Golden Drop. Be so good as to send a leaf of the Peaches 1, 2, 3.‖

Names of Plants: *Erzeroum.* 67, Echinospermum; 142, Cerinthe.—*P P.* No. 1, Acineta glauca is Cycnoches Pescatorii, under which name it will be published in "Paxton;" it belongs to the same set as Cycn. barbata; 2, Brassavola Perrinii; 3, Perhaps Onc. Baueri, which differs from O. altissimum by its contracted panicle; 4, some variety of Gongora fulva.—*Kirkennan.* The bush is Rhamnus catharticus; the tree seems to be some sort of American Walnut.—*H R J.* Cratægus punctata.—*A Constant Reader.* Quercus Cerris.—*A Florist.* Mahernia incisa and Phlox suaveolens. Allamanda cathartica is a stove plant.—*Sylvanus.* Leonotis Leonurus.—*M E H.* A very common monstrous form of Lilium candidum; we are not aware that it has any particular name, except that of "monstrous."

Peaches: *Sub.* says, "My Peaches on a south wall are now so woolly as to be quite worthless; can you inform me of the cause of this defect? Is it owing to the weather, or the soil, or to the sort, or to being left to hang too long upon the tree?" [We presume to the sort; but should like to hear from others.]

Peach Trees: *Sub.* When Peach trees have suffered much from blight two or three years running, there is little chance of their recovery, and new trees should be planted. But this only upon the supposition that they are gumming and cankering, and making no sound wood.

Potatoes: *Z.* The holes in the haulm are where the leaves grew, and are not caused by insects, but by the natural decay of the stalk at those places. The Lychnis stalk is what is technically called "fasciated;" the cause of such appearance is unknown.

Rating Greenhouses: *W B B* would be glad to know if William Malcolm, of Kensington Nursery, and others, went as a deputation to the Right Hon. W. Pitt respecting the rating or taxing nurserymen's glass, and what was the decision?

Roberts's Strawberry Tiles: *D Kidd.* Much obliged: it arrived too late for this week.

Truffles: *Constant R.* No means of cultivating Truffles have yet been devised.

Yucca Gloriosa: *Sub.* The flower stem may be removed, as soon as the plant has done blossoming.‡

Misc.: *P T O.* Roman cement may be repaired by another coat put over the old one. Get the old wood of the Passionflower thoroughly ripened, and as much as you can of it. Cut off, in pruning, nothing more than the weak or unripe wood.

GUANO AND OTHER MANURES FOR WHEAT SOWING.—On Sale, Guano (finest Peruvian), Superphosphate of Lime, made from Bone, Bone-dust and half-inch, Dried and Prepared Night-soil, Urate, Gypsum, &c. Also Foreign and English Linseed Cake of the best quality.—Apply to MARK FOTHERGILL, 204 A, Upper Thames-street, London.

THE LONDON MANURE COMPANY beg to offer as under:
LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
TURKEY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.
The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Clover Manure, per ton	£11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

DR. S. NEWINGTON'S AGRICULTURAL INVENTIONS.—An Illustrated Catalogue, together with a Lecture on the Seeding of Grain, and the after cultivation of the crops, sent gratis, on application to Messrs. DUFAUR and Co., 21, Red-lion-square, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.
Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.
Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

IMPORTANT NOTICE.—EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

The Agricultural Gazette.
SATURDAY, SEPTEMBER 21, 1850.

MEETINGS FOR THE FOLLOWING WEEK.
THURSDAY, Sept. 26—Agricultural Imp. Society of Ireland.
THURSDAY, Oct. 3—Agricultural Imp. Society of Ireland.

HAVING received a copy of the pamphlet, lately published by Lord WILLOUGHBY D'ERESBY, giving plans and description of his STEAM PLOUGH, I feel the more called upon to offer a few observations on it, as I saw, when abroad lately, a long quotation of some remarks of mine * on Steam-*cultivation* appended to an engraving of Lord WILLOUGHBY'S machine in the '*Illustration Universel*,' (the Paris 'Illustrated News,') by M. ST. GERMAIN LE-DUC.

But no two views of the subject, I fear, can be wider apart than those of his Lordship, and my own. I hold it (under favour) to be an idea *fundamentally erroneous* to attempt to combine steam-machinery with the Plough. I have already given my reasons for this at some length in a little work published last year on the history of Agriculture, from which the extract in the French Journal above alluded to, was taken. And I hope I am not presumptuous in repeating my conviction that until the idea of the Plough, and in a word, of all *Draught*-cultivation is utterly abandoned, no effective progress will be made in the application of Steam to the tilling of the earth. I repeat what I have said before, that 'ploughing' is a mere *contrivance for applying animal-power to tillage*. Get out of animal power, and you leave 'ploughing' behind *altogether*. Get into steam-power and you have no more to do with the Plough, than a Horse has to do with a spade. It is *no essential whatever* of cultivation that it should be done by *the traction of the implement*. Spade-work is perpendicular. Horse-work is horizontal. Machine-work is *circular*.

Whoever would now dream of retaining the form of the hand-flail in the Threshing-machine, or that of the oar in a steam-ship, or of putting the piston-rod to work at the lever-end of a pump-handle? Yet doubtless these bastard attempts were all made in their day, till the several inventors had come to see in turn that

"'Tis gude to be *off with the old love*
Before ye be on wi' the new!"

I am aware that I am repeating myself, unavoidably, in all this; but no one can imagine, without trying it, the difficulty of making the mechanical part of the question intelligible to the agriculturist, and the agricultural part to the machinist. The steam-engine has no taste whatever for straight draught. He is a *revolutionist*, in the most exact sense of the word. He *works* by revolution; and by revolution only will he cut up the soil into a seed-bed, of the pattern required, be it coarse or fine. And *that*, it is my firm belief, he will be seen doing at a handsome average, before a very large portion of another century shall have passed over our heads. Why should it not be? Why should not a strip or lair of earth be cut up into fine soil *at one operation* (and sown and covered in, too), as easily as a circular saw cuts a plank into saw-dust? As to employing a steam-engine to turn a drum, to wind up a rope, to drag a plough, to turn up a furrow, and all this as a mere prelude for an after-amusement to all the ancient tribe of harrows, scufflers, rollers, and clod-crushers, to do supplementally the real work of cultivation, it reminds one of "the house that JACK built." One can hardly blame the iron ribs of any respectable boiler for bursting at the first pull at a task so utterly at variance with every known law of mechanical advancement, so offensive to the economics, I had almost said the very ethics of the steam-engine.

I trust I may be forgiven for so boldly speaking; but I am sorry to think of one useful shilling being thrown away in the attempt, unprofitable even if successful, of harnessing steam with horse harness, to do horse's work in a horse's way; the implement itself, whose wretched work it is put to accomplish, being a tool with sentence of death written upon it (be it as ancient as it may), for its tyranny to the subsoil, which bears the whole burthen and injury of its laborious blundering path.

I say the Plough has sentence of death written upon it, *because it is essentially imperfect*. What it does is little towards the work of cultivation; but that little is tainted by a radical imperfection—damage to the subsoil, which is bruised and hardened by the share, in an exact ratio with the weight of soil lifted, *plus* that of the force required to effect the cleavage, and the weight of the instrument itself. Were there no other reason for saying it than this, this alone would entitle the philosophic machinist to say, and see, that the plough was never meant to be immortal. The mere invention of *the subsoiler* is a standing commentary on the mischief done by the plough.

Why then should we struggle for its survival under the new dynasty of Steam? The true object is not to perpetuate, but as soon as possible to get rid of it. Why poke an instrument seven or eight inches under the clod, to tear it up in a lump by main force, for *other instruments to act upon*, toiling and sweating and treading it down again, in ponderous attempts at cultivation wholesale—when by simple *abrasion of the surface* by a revolving-toothed instrument, with a span as broad as the hay-tedding machine, or CROSSKILL'S clod-crusher, you can perform the *complete* work of *comminution* in the most light, compendious, and perfect detail?

Imagine such an instrument (*not rolling* on the ground, but) performing *independent* revolutions *behind* its locomotive, cutting its way down by surface abrasion, into a semicircular trench about a foot and a half wide, throwing back the pulverised soil (just as it flies back from the feet of a dog scratching at a rabbit-hole): then imagine the locomotive moving forward on the hard ground with a slow and equable mechanical motion, the revolver behind, with its cutting-points (case-hardened) playing upon the *edge*, or *land-side* of the trench as it advances, and capable of any adjustment to coarse or fine cutting, moving always *forward* and leaving behind perfectly granulated and precisely *inverted*, by its revolving action, a seed-bed seven or eight inches deep, *never to be gone over again* by any after-implement except the drill, which had much better follow at once, attached behind with a light brush-harrow to cover the seed.

It is hard, by mere language and without a diagram, to describe intelligibly to the mind's eye an instrument that has not been seen; however it may have become familiar enough to my own eye. My notion may be wrong, but I am strongly induced to feel that such an instrument alone will ever fulfil *the requisitions of the steam-engine*, which shortens and *remodels* every labour it undertakes, and never condescends to old appliances, except where they are themselves intrinsically perfect in their mode of action.

Why did Steam reject *the Pump-handle* and *the Oar?* Because in both the leverage is obtained by loss of labour and time, occurring during the back-movement of the handle, a movement necessary to the manual, but not to the mechanical agent. For the same reason whenever it is applied to till the earth, it will antiquate every instrument that *cultivates by traction*, because traction is not only not necessary to cultivation, but is inherently mischievous on other grounds, apart from the clumsiness, inaccuracy, and incompleteness of the work it turns out.

But THE STONES! There is much fear expressed for the teeth of the circular-cutting implement I have described, when they come in contact with Stones. The objection would have been equally valid, at first sight, against the use of the Plough or the Scuffler. Let me see the instrument in use where there *are no stones*—(and there are plenty of broad acres in England of this class;) and it will not be long before it gets upon the others. If it cost five pounds an acre to clear them out, it must be done, and would in such case, well pay to do it. But the truth is that the instrument itself suggests the kind of machine which, with a little adaptation (greater power and slower motion), might perform this preliminary service at the least expense. If land is to be like a garden in one respect, I see no good reason why it should not in all. I do not think stones will stand long in the way of Steam, or be readily-preferred to bread; if, *where there happen to be none*, a steam-driven cultivator can be brought to bear, which, after the simple and beautiful example of *the mole*, shall play out the long comedy of our present field cultivation in *a single act*, present a finely-granulated seed-bed by a single process, almost at the hour required, and trammel up the 'long summer fallow' into the labour of a day, with an accuracy as perfect as the turning of a Lathe, and an aëration (and consequent oxygenation) of the soil as diffusive and minute as that of a scattered mole-heap, or the dust flying from a steam-saw bench.

Implement-makers and mechanicians would not be long in understanding all this, if they were not under the supposition, received at second hand by them, and therefore the more difficult to eradicate, that ploughing is a necessary form of cultivation to be kept in view. Once let the Q.E.F. be clearly understood by them, once let them be made fully to perceive that 'ploughing' is merely the first of a long series of *means* towards the accomplishment of a particular end, that end being the production of *a seed-bed*, of suitable depth and texture, and with the soil as nearly as possible inverted in its bed—and I do not think they will be long in setting the steam-engine about its proper task, in the proper way. But their attention is distracted, at present, from the end to the means. They are taught to think that the plough is a *sine quâ non*—that steam-cultivation of necessity implies steam-*ploughing*, and they are led to give up the task in despair, bebause they are at fault upon a false scent.

We have many *rolling* implements employed in the field, but we have only one instance of a *revolving* implement. The clod-crusher and the Norwegian-harrow *roll*, the hay-tedding machine (one of the best instruments ever invented) *revolves*. I use the words somewhat arbitrarily, but the difference I allude to is very important. The first are liable to the evil of 'clogging;' because they derive their axis motion *from the soil* as they pass over and *press upon* it. This action must not be confounded with that of a machine which *has its cause of revolution within itself*, independent, and acting *upon* the soil as a circular-saw acts upon a board, or the paddle-wheel of a steamer, upon the water. The teeth of a saw clear themselves, by the centrifugal motion they communicate to the particles they have detached from the substance they act upon. A circular 'cultivator' steam-driven will do the same, for I have proved it. It does so more effectually according to the speed (of revolution) and the state of moisture of the soil. This last incident is as it should be; for it is not desirable that a clay soil should be dealt with when in an improper state for cultivation; and one great advantage of such an instrument as I point to would be that it would so immensely enlarge the choice of a suitable period, by its compendious accomplishment of the whole work of culture.

My object however, at present, is not so much to

* See page 75, in No. 5 of the *Agricultural Gazette*, 1850.

advocate the particular mode of applying Steam-power, which I myself suggest, as to explain again, and more fully, the grounds on which I feel more and more strongly assured that the attempt to employ it through the medium of the plough must be eventually renounced. I have left a great deal unsaid, to avoid prolixity; but propose, at another opportunity, to enter more closely into the subject. Mr. Way's admirable Lectures on The Effect of Manures relativrly with the degree of disintegration of the Soil, read me a forcible chapter on the *Agricultural* bearing of the mode and means of cultivation I have hinted at, and on which a good deal had passed in my mind, from the peculiar notice bestowed on that passage of my work above alluded to, but which only went so far as to assert the superiority of the spade, as a cultivator, over the plough; a superiority which I am now far from thinking unsurpassable. *C. Wren Hoskyns.*

The discussion, which has occupied some of our correspondents during the past few weeks, on the subject of Clover Failures, was brought to what must, for the present, be considered a satisfactory conclusion, by the paragraph in our last week's Number from the pen of Professor Henslow. One thing seems tolerably clear — that analysis has hitherto failed to corroborate, with any certainty, the theory which attributes the result to an exhaustion of those particular substances in the soil which form the known composition of the Clover plant it is supposed to require. And we are thus thrown back on physiological considerations in our search for an explanation.

We refer once more to the matter, just to draw the attention of our agricultural readers to the desirableness of the experiment which Professor Henslow has suggested. If, on any land liable to this disease, or infirmity, or whatever it may be called, a single ridge were left unsown with Barley at the next Barley seed-time, in instances frequent enough to embrace all the varieties of English soil and climate, a comparison of the Clover on the sown and unsown ridges over that extent and variety of circumstances, would be likely to expose the cause of the mischief, and so to suggest a method for its removal.

It would at all events show whether the failures so frequently recorded of this crop are owing to the unnatural conditions to which, during a considerable period of its growth, it is subjected. We hope that this will be borne in mind, next spring, by a number sufficient to clear up the mystery in which the subject is at present involved.

ON MANURING EVERY CROP.

In the *Agricultural Gazette* of Aug. 3, there appeared an interesting letter from Mr. Paine, on your remarks on Mr. Hudson's plan of manuring for every crop. It appears that Mr. Paine has followed this plan for many years with perfect success, and has kept his land in good heart, by the aid of artificial manures alone, the farm-yard manure being systematically applied to the Hop-grounds. It is for the purpose of pointing out how far Mr. Paine's plan of thus dispensing with farm-yard manure is generally applicable, that I would direct attention to the subject.

In the first place, artificial manures are indispensable, if the plan of manuring for every crop is to be adopted. As, however wet the land is, they can easily be applied, to say nothing about the little labour they require in carriage, as compared with dung or compost. The difficulty is, how far the former will supersede the latter in general farming. There is no doubt but that, upon fresh land, and where they are eaten on with sheep, Turnips can be grown with nothing but artificial manures. But where this practice has been long persisted in, it has been found advisable to use a portion of farm-yard manure along with the other. The deterioration of the land, necessitating this use of the two combined, is the more distant the more Turnips and Clover are eaten on the land. To those who, like Mr. Paine, can dig such an abundant quantity of coprolites out of the subsoil of their own farms as to be able to apply it at the rate of 8 cwt. per acre, as well as occasionally to consume the Turnips on the ground, it appears that, as far as the Turnip at least is concerned, this deterioration may be indefinitely postponed. But, in addition to these, it appears that Mr. Paine is also near a marl pit. Such local advantages are so rarely combined that though admiring the boldness which has enabled him to dispense with ordinary manure altogether, still it is an example that must be cautiously imitated, as we strongly suspect, that even with the large quantity of coprolites, he is able to apply, he would be unable to keep his land in good heart, without either farm-yard manure or marl—these two latter being often rich in certain substances required by vegetation, and which are not abundantly present in either coprolites or guano. Mr. Paine's letter has tended to modify my views of the extreme importance of farm-yard manure, without, however, satisfying me that the exclusive use of artificial manures can be generally adopted. Mr. Paine has gone further than you ventured to recommend; your remarks being intended to show the advantage and importance of using artificial manures along with the farm-yard manure, and to point out that whilst Turnips and other green crops could in many cases be grown without farm-yard manure, as a general rule artificial manures could not be depended on for the cereals. That at least has been the result of my experience and observation.

That fallows have been diminished, are diminishing, and will be still further diminished, is our opinion; but there is yet a great extent of land on which, partly from the want of drainage, and partly from the nature of the soil, green fallow crops are the exception to the rule. It is upon such land as this that we particularly request information as to how far artificial manures have enabled our readers to dispense with farm-yard manure. Upon these soils nothing we have hitherto tried bears any comparison with the dung heap.

This is a most important matter, and we will do our utmost to procure a satisfactory solution to the following question. What is the reason that a good Turnip crop can be grown with artificial manure, and why can they not be exclusively depended upon for the cereals after a bare fallow? I am aware that I expose myself to the attack of some of the formidable go-a-head men of the present day, by the mere use of the word "fallow." But as I am not defending fallows, but finding them already in existence, it becomes of importance to ascertain the best method of cultivating them.

In your remarks on this question, you pointed out the probability of the Clover being one of the most likely crops, on strong clays, to derive benefit from the liberal use of artificial manures; upon cereals I recommend some caution in their use.

In Mr. Hudson's case of manuring for every crop, it must not be forgotten that between every two grain crops, either a crop of Clover or Turnips intervened, which were eaten on the ground along with oilcake by sheep. This is obviously applying the manure for the grain crop in a different form to what it is possible to do on strong clays. Does this point out to us the importance of using a more highly azotised manure for the grain crop than for the Turnip? We know that the dung of animals fed on oilcake is especially rich in azote or ammonia; and Mr. Paine, as the result of his experience, expresses a wish that ammoniacal salts can be furnished to us at a cheaper rate than we have hitherto been able to procure them in guano. *T. L. C.*

THE CONSTRUCTION AND VENTILATION OF STABLES.

(*Concluded from p.* 522.)

The first step to be taken in ventilating stables is to make provision for the admission of fresh air. This ought to be done at the very lowest part of the building. The simplest method is by making apertures (proportioned, as we shall hereafter show) in the wall nearest the ground. If there is only one side of the stable occupied by the horses, the fresh-air apertures should be made in the wall opposite to the stalls; the bottom of the apertures should be flush with the inside floor. If these apertures are left quite open, not only will spaces be left through which rats may obtain admittance to the interior, but, what is of more importance, the air will be allowed to rush in, in one unbroken volume; thus creating a disagreeable draught. This latter inconvenience will be best obviated by fixing on the interior, across the aperture, a sheet of perforated zinc, with holes say from 120 to 140 in the square inch. Instead of zinc, horse-hair cloth or cocoa-nut fibre may be used; or for want of a better material, coarse canvas. The outside of the apertures ought to have means by which the quantity of air admitted may be regulated. The simplest that can be adopted are the following. First, a box made of wood, say half-inch thick, the inside diameter of which is equal to that of the aperture, and the depth not greater than 3 inches; it must be open both at top and bottom. Fasten this on the wall, opposite the aperture, so that the inside of the aperture and it shall be on a line. Let it carry a flap inside capable of being held in any position that may be required, so as to allow much or little ingress. The second mode consists of a wooden box, exactly similar to those pipes often seen at the end of liquid manure carts; and similarly provided with a vertical sliding shutter. This may be fastened opposite the apertures, and according as the shutter is lifted up, so will the air be admitted.

A very desirable and simple valve may be made of zinc, in the following manner: make a square zinc box, of length equal to the depth of aperture in the wall, and of size to fit closely in it. The length of this should be equal to the depth of wall; open at one end, and closed at the other with a flat piece of zinc, half an inch or so larger all round. To this side should be attached a knob or handle to move the box in and out of the aperture. On the four sides of this moveable box, cut out slits or apertures, those being larger nearest the closed or outer end, and getting gradually smaller towards the open or inner one. If this box is slid into the aperture, close up to the wall, the projecting flange preventing it from going altogether through, the aperture will be closed, so that no air will be able to pass through to the building; if, however, it is pulled out some inch or two, the slits or apertures will be uncovered, allowing air to pass through them to the aperture, thereafter to the interior. The more the box is withdrawn, the more holes will be uncovered, and the more air admitted. The small holes or slits may be placed nearest the closed end, and gradually increasing in size towards the open end. The whole area of these, when the box is fully out, should manifestly be equal to the area of the aperture. To prevent the box being pulled out altogether, a small catch or projecting piece may be placed at its open end. All these contrivances we have described, however simple and effective they are, are nevertheless open to some objection, that is, that they project some distance from the wall, to which they are fixed; this is inconvenient, as they are liable to be destroyed, being in the way. If this is objected to, the simplest form of valve, which is close up to the wall, is the "sliding" or "damper" valve. It consists of a frame of zinc, iron, or other indestructible metal, fastened to the wall, opposite the aperture; a solid flat piece of iron or zinc, larger than the aperture, slides in the inside of this framing vertically. A spring may be used to keep it in any desired position; but the general method is to suspend the moveable plate, by a chain passing over two pulleys, working in brackets fixed in the wall, and having at the extreme end a counterpoise weight, exactly balancing the valve plate; by moving the counterpoise up or down, the plate is passed from across the opening in any desired ratio.

As the air near the bottom of the wall, on the outside, may be liable to be filled with dusty materials, &c., it may be deemed advisable to lead the air to the interior from a higher source. In buildings about to be constructed, this will best be done by building flues in the upright wall, having the outside aperture covered with bars of wood, or metal, to prevent birds from passing down the flues. The aperture for the admission of the air to the interior should be flush with the floor, if the air is admitted at once to the interior. In stables where the heads of stalls are placed at the walls, they cannot thus be supplied with fresh air, the horses incurring the risk of injury by cold draughts. When the stalls run alongside each wall, there is necessarily a passage between them. Here then is the best place to admit the air. If apertures or small pits, say 18 inches square, and 8 or 9 inches deep, are made in the floor, in the centre of this passage, at regular distances from each other, and covered with gratings to prevent accidents—air being admitted to them, it will pass through the apertures in the grating, to the interior. The best way to supply these pits with air, is to lead a tunnel communicating with the external atmosphere, from the side of each. Thus, suppose a passage to be between two rows of stalls, each row having six stalls, a fresh air pit should be placed opposite each stall, and supplied with air by a pipe or tunnel, leading from the outside wall, and running beneath the stall.

Where either of these plans for admitting fresh air are not considered eligible, from fear of expense or from local circumstances preventing their being carried into effect, the following plan may be adopted. At the distance of 4 or 5 feet from the floor make apertures in the outside walls; to the inside fasten boxes in such a manner that the air in entering shall be thrown upwards. A simple plan of obviating the inconvenience of having the air thrown down on the horses, is by having the apertures cut in a sloping direction, instead of horizontal.

We have now to consider the best plan of removing the foul vitiated air from the interior of the stable. The natural motion of heated air is upwards; it is the best mode in theory to remove it from the top of an apartment. And it is also so in practice; to draw air from out of its natural upward course, either in a horizontal or downward direction, requires power of considerable force. This power is generally obtained by fire draught, and sometimes by machinery. The most simple and obvious mode of allowing the foul air to escape is by mere openings made in the roof; these, however, are inadmissible, as the rain is allowed free ingress by them, and the wind is easily dashed downwards to the interior. The next simplest plan is to have louvre boards placed at the roof, or at the side walls near the ceiling, if there is an inner ceiling, thus making a space between it and the roof, in which generally hay, &c., is placed; the best planof withdrawing the foul air is to have wooden boxes communicating with the interior of the stable by apertures made in the inner ceiling. These boxes should pass up through the space between the ceiling and roof, through apertures made in the roof. They should project at least 18 inches above the roof, and be furnished with contrivances by which the wind and rain may be prevented passing down them. If there is no inner ceiling, but the external roof boarded simply over, the apertures should be made in the highest part, and be provided with boxes projecting some distance above the ridge, and properly finished at top. These wooden boxes will act much more certainly for the withdrawal of the foul air than the common luffer boards so frequently used. As the ascensive power of heated air depends upon its temperature, due means should be taken to preserve this till it is finally delivered to the atmosphere. If, then, it is confined in tubes it will be kept closer together, in a more concentrated form than if allowed to spread itself beneath a wide open luffer boarded space. As it is of importance to have the apertures for the admission of the fresh and the withdrawal of the foul, well proportioned to the number of animals there may be in the stable, we give the following rule, deduced from practical experiments, made by writers on the subject. Supposing the height of the house, from the floor in the interior to the ridge of the roof, to be between 20 and 25 feet, the square surface or area of the aperture for withdrawing the foul air should be 10 square inches for each animal, horse, or cow, housed in the stable. If the height is 30 feet, and between that and 25, 12 square inches of aperture should be allowed

for each animal. Thus, if the height from floor to ridge is 27 feet, and the number of cattle contained is 12, then 12×12=to 144 square inches, or one square foot, is the size of aperture; a box or hole 12 inches square will give this area. Instead of having one box of this size for the exit of the foul air, it will be better to divide this into two or more, and place a box at certain intervals along the roof—the foul air rising at several points, will at once be taken away; whereas, if one aperture alone is used, say, at the centre of roof, the foul air from either end of the stable will have to travel along till the aperture is gained. In dividing the area of aperture thus found, it must be remembered, that half the size of box will not give half the area. Thus it might be supposed that if a box 12 inches square, gives 144 sq. inches, one 6 inches square would give 72 or half, whereas it only gives the fourth, or 36 inches; so that four tubes of 6 in. square would be required to give an area equal to a box of 12 inches square. If the boxes are made square, an easy way of computing the area of their ends or section, is by multiplying the length of one of the sides by itself; thus, a box 3 inches square has an area of 9 square inches; 4 of 16, 5 of 25, and so on. The area of the fresh air apertures should be equal to that of the foul air.

In cold weather, the great objection to ventilation of stables, is the cold air admitted. Simple and inexpensive modes of heating are easily available, and should be adopted. On a future occasion we may present our readers with a few notes on the subject. *B.*

THE MANAGEMENT OF HEAVY SOILS.

The terms heavy and stiff are often used in reference to soils which, if thoroughly drained and well cultivated, would merit a different description; but for the purpose of this discussion, all wet soils may be included, as their present state in most parts of England appears to be similar in many respects, and the suggestions which may be thrown out will be generally applicable to them.

The improvement made during the last few years in the management of such soils thoughout the country has on the whole been considerable; many thousands of acres have been thoroughly drained and brought under a more perfect system of culture, nevertheless an inspection of the wet soils of England at the present time shows at once that but little improvement or work of any kind is or has been attempted upon them, whilst that little is for the most part done badly. There are of course numerous exceptions to this rule; it would be singular if there were not, considering the rank attained by this country in all that relates to art, science, or civilisation. Many adopt improvements, employ much labour, and direct it in accordance with the requirements of the case; but after making every allowance for the large proportion of Grass land requiring little labour, the general result is as above stated. Cutting and securing the hay crop is well managed, and so are stacking and thatching. The latter is particularly well done, much better than in any part of Scotland, but the progress of permanent improvements is slow and uncertain, and most of the operations of culture, such as ploughing and harrowing, are managed in a manner which must necessarily come short of the purpose intended.

Of the causes which have contributed to this state of matters little need be said here, the chief cause is undoubtedly the want of proper relations between landlord and tenant. Little improvement can, as a general rule, be expected, until better arrangements in this respect are made, having for their object the benefit of all parties, by enabling that mode of management to be adopted, which will best develop the fertility of the soil, and bring about its permanent amelioration. This stands at the very threshold of improvement, and such being the case, it seems surprising that a good understanding on the subject does not universally prevail. Industry and skill are the sources of wealth and prosperity, and it might be supposed that all concerned would be ready to encourage their application, and to assist in removing any impediment thereto, but this leading principle does not appear as yet to have been generally recognised by those most interested.

The greatest drawback at present to the proper management of at least three-fourths of the soil of England, is the want of thorough draining; the rain water is retained more or less amongst the roots of the crop, instead of permeating equally through the whole mass of soil, to a depth of 2 feet or 3 feet from the surface, and passing clearly away from thence, without being checked at any place; under such circumstances, even the most skilful management would fail in preserving the crop from injury, or the soil, when stiff, from being cemented together. To say that such soil should be drained without delay, is to say nothing; its drainage ought long ago to have been complete, and the occupiers should by this time have been able to undertake all labour necessary to its full fertility, and to manage every detail thereof, not only in a perfect, but in an economical manner. If draining were carried out to the required extent, superior management would soon follow. The light dry soils of Norfolk and Suffolk are on the whole very fairly cultivated, and the same observation may be made respecting the wolds of Lincolnshire and Yorkshire. The downs of the southern counties, and other places where the soil, though not naturally very fertile, is naturally dry, and fitted to admit of an extended system of green cropping, now recognised as an essential feature of well conducted farming. It was no doubt the dry condition of a large portion of the land in the Lothians, coupled with a good climate, and the vicinity of good markets, which enabled that part of Scotland to take a lead in farming, and to maintain a superiority so long over other parts, over the west of Scotland for instance, where much rain falls, and where much of the soil, only a few years ago, was of the wettest and stiffest kind; but the introduction of thorough draining, and the formation of railways, have already effected a great change. Every year is bringing the condition of soils, formerly reckoned stiff and inferior, near to that of the Lothians, and in the end the value of the former may possibly not be much below that of the latter. In like manner, the wet soils of England, if thoroughly drained, might soon be managed as well as those naturally dry, and when this has been done, the produce of the heavier soils will be much the greatest.

The shallow working too, so common in all parts of England, suits the lighter soils, whereas it scarcely constitutes half culture on those which are firm and heavy. The reason will be apparent to all who understand the principles of tillage, and the importance of a suitable texture in the soil. Imperfect harrowing, and the use of four or five horses in line in the plough, also operate very injuriously upon the heavy soils, whereas their effects would scarcely be apparent on the lighter. The great object in the management of stiff soil is to keep it open, and bring all its minutest parts into ready contact with air and water, to the greatest possible depth. To succeed in this, perfect working and great care in many respects is necessary. The proper result cannot be attained until the drainage is complete, but a soil 8 inches in depth might in all cases be procured, if the land were properly ridged; this would be greatly superior to the present depth of 3½ inches or 4 inches, but still it would be insufficient, especially for tap rooted plants, such as Beans. Accordingly each time that green cropping or fallowing is undertaken after thorough draining, one furrow at least should be carried to the depth of 12 inches, every clod within that depth should be reduced as near as possible to a powder, by harrowing and grubbing, and the new and old earth will at the same time be mixed and blended together. The surface soil will not by this means be buried, it will still be available, together with all the ingredients it contains, and the new earth will be available, also, both chemically as affording matter for the sustenance of the crop, and mechanically as assisting to form a proper medium for the preparation and retention of its nourishment. If the soil is stiff at the depth of 5 or 6 inches, no better reason can be given for turning it up at once, that it may be ameliorated by being mixed with that on the surface, but generally it is not stiff at the above depth. It has been beat together by a wretched system of management, but it is not tenacious until reaching a depth of 13 or 14 inches. The subsoil below 12 inches should be stirred to the depth of at least 6 or 8 inches, more as often as may be necessary to keep it open, and fit it for absorbing water readily from the upper soil; but as a general rule, no part of it should ever be brought to the surface. The plough should work not less than 6 inches deep each time the soil is turned over; deeper ploughing can be managed at any period, but it is of comparatively little avail, unless the new earth turned up is afterwards pulverised effectually and thoroughly mixed with the old, as well as exposed to the powerful influence of the sun during the process, and this can only be done to advantage at the time of green cropping or fallowing.

If green cropping, upon the heavy soils of England, were extended to four or five times its present limits, it would form a grand means of keeping the soil open, clean, and pulverised, and would afford scope for the industry and skill of the farmer. One of the chief advantages of fallowing is the facility with which the soil under its operation can be deepened, and mixed together more effectually than has ever been attempted before, but this can also be managed in preparation for green cropping; in either case, supposing the drainage to be perfect, the first furrow given in spring should be 12 inches deep, whatever the depth of the winter furrow may have been; it may be given across if circumstances answer, or at an angle if the land is steep. The breadth of the furrow should not exceed 6 or 7 inches, that the draught may not be too great, and that every part of the earth to the above depth may be stirred and fairly shifted out of its place. The land should be well harrowed previously (an operation generally neglected in England), and an abundance of grubbing and harrowing may do all that is necessary afterwards. It should be observed that subsoiling or ploughing to a greater depth than 5 or 6 inches upon light land would be likely to prove injurious.

But how can ploughing to a depth of 12 inches, on stiff soil, be managed with the ploughs used in many places, and especially with the method of yoking horses in line to them; the truth is, it cannot be accomplished by such means, but this does not alter the necessity of its being done, although it shows the necessity of procuring implements fitted for the purpose, and of training men and horses to apply them properly. The common swing plough, well made and used, and drawn by three horses abreast, is quite sufficient. Some now use ploughs of a rather larger size, which are no doubt better, but the common plough will answer perfectly if the depth of its body is sufficient, its cutting and turning parts not shaped and placed by mere chance, but with a perfect knowledge of the work they are to perform, and the conditions essential to their performing it effectually, and with the least expenditure of power; its beam at the coulter placed so as to balance as nearly as possible the resistance on each side, and continued from that point to the muzzle or nozzle in the line of motion; without some degree of attention to this, no plough ever did or ever will work well. The practice of yoking horses in line, occasions the necessity of twisting the beam to the right, to make the plough take up a position 9 or 10 inches to the left of the horses. But it is easy to see that the draught must be thereby increased, and that the implement cannot work so steadily. Very few even of the best ploughs met with in England, possess the properties necessary to adapt them for the work of a well managed farm; but all farther mention of their defects must be deferred for the present.

Harrows for working heavy land should contain eight bulls, and consist of two parts only; to make these parts act as one they should be firmly connected by iron rods running across their whole breadth through the bulls and jointed at the middle; the harrow will then accommodate itself to the inequalities of the ground, and at the same time possess the power arising from its being thus connected—its whole weight will be available to prevent its being readily tossed up and down. The bulls should be 6 feet long, to distribute the tines effectually, and to impart that steadiness essential to proper working. They should be furnished with five tines each, and placed 14 or 15 inches apart; they should be drawn at that angle which is necessary to make the tines cover the whole of the land equally, without omitting any part or following in the track of each other, and the tines should be of sufficient length to prevent the bulls from touching the ground. Such harrows may be drawn by three horses, abreast, or by two as the surface becomes smooth; if the soil is of a stiff description it should be harrowed when not too dry. Sometimes it is advisable to harrow soon after ploughing; the cultivator or grubber should take in not more than 3 feet, its tines should only be five in number, they should be sufficiently in advance of each other, and the body or frame on which they are mounted should be of sufficient length for that purpose; the points or socks, if feathered at all, should not be more than about 4 or 4½ inches broad. They should be long pointed, and the points should be kept thin; that part of the tines underground should be set forward at a considerable angle, to make them penetrate readily.

The advantage of a smooth surface, especially in facilitating the use of the cultivator or grubber, will be apparent; the drainage should be such as will allow the land to remain in a flat state with perfect safety; but in the meantime, until draining can be done, ridging is a point requiring much more consideration than is usually bestowed upon it. The ridges should not be less than 14 feet wide, at that width they should be raised nearly a foot in the middle, and the surface of each should form exactly the segment of a circle: culture may then be made as effectual, manure as beneficial, and the crop as secure as they can be without thorough draining; all parts of the ridge will be affected equally by the water falling on it, the surface will be nearly level for some distance on each side of the centre, and no part unduly exposed to drought, and the sides becoming steeper as they approach the furrows will accelerate the progress of the water tending there, as it increases in quantity. The furrows should be deep and clear, and of a regular inclination in the bottom to convey the water away when collected. The convenience of working requires that they should be straight and perfectly parallel to each other, and that the ridges should all be of equal width; ridges once properly formed should never be altered either in shape or position until the drainage is made perfect.

In the management of heavy soils everything which tends to consolidate either the soil or subsoil should also be as much as possible avoided; ploughing when the soil is saturated with water, and especially ploughing at any time with four, five, or even three horses in a line, should be carefully guarded against, if for no other reason than to prevent the subsoil from being glazed over or beaten firm. The use of horses and ploughs on such soil at all is a necessary evil, the effects of which may however be in a great measure obviated by perfect culture and proper care. Carting should also be conducted with care, and avoided if possible when the soil is not in condition; even heavy cattle should be excluded when the ground is soft in winter, as they then occasion injury in various ways; heavy soil requires no pressure, its own weight assisted by the action of rain soon makes it sufficiently firm, after it has been ploughed or stirred. Hence rolling, especially if the land is in Grass, should seldom be attempted, unless absolutely necessary to smooth the surface for cutting, and then a light roller made of timber, and used when the soil is not quite dry, or soon after a slight shower has fallen, will answer the purpose. An equal and ready filtration of all rain water through at least 18 inches of soil, and the complete exclusion of free water within or below that depth, is the first condition necessary. When this result is attained, air and heat are at the same time freely admitted, and the soil to a considerable depth undergoes a gradual disintegration, and becomes less stubborn, more easily cultivated, and more fertile, to secure an equal diffusion of water, and prevent the slightest accumulation thereof. Drains must be made of a suitable depth, and also near each other. Mixing and pulverisation of the soil 12 inches deep, and stirring the subsoil below, will then bring all parts of the earth into immediate contact with air and water, and the admixture of burnt clay or any other porous material fitted to assist in keeping the soil open, will be highly beneficial, especially on the stiffest kind of soil; on the other

hand, compression of any kind will assist in excluding the air, and in checking the descent of water, and must accordingly prove injurious.

Extensive improvements are in many places required to general and thorough drainage before the land can be managed easily and well, and it seems desirable that these as well as the amelioration of the soil should be constantly going on. The state not only of the farm, but of the farmer himself, and his servants, cattle, and implements, should be tending toward perfection, which however no one is likely to attain in all respects for at least a century to come. The expense of improvement in various cases appears to have been heavy, on account of the whole being done at once; whereas, in other cases, the greater part of the work has been managed by properly directing the labour of the men and horses usually employed by the farmer. The number of horses on English farms generally appears sufficient, but the methods of yoking more than one to a cart, or two to a plough, are, as a general rule, far from satisfactory. The work of a well managed farm cannot in any case be economically and readily gone through by such means. The adoption of a good system of working would enable much more work to be undertaken at the same expense, and experience, combined with proper care, as regards allotting to each man that share of the work which he is best qualified to perform, might soon enable all labour to be done well. The practice of entrusting awkward boys or untaught men with important work, such as ploughing, should be abandoned, as this of itself must go far to obviate the chance of success either in the case of high or low farming. Work of almost every description must be done much more effectually, and made to answer the purpose with much greater certainty, than at present, before high farming as regards the application of much labour, the purchase of much manure, and the growth of the finest kind of crops can be successful; labour skilfully applied is quite necessary, but unless the purpose is answered the expense may not be repaid, and matters may only be made worse. The breaking up of heavy Grass lands, for instance, would be a great advantage if properly managed, seeing that scarcely a single acre thereof has ever been laid down in a condition fitted to derive the full benefit of a surface dressing, or produce a good crop of Grass; but if the land on being broken up were tilled in the same imperfect manner as much of that already under cultivation, it would be deteriorated instead of improved, and yet no crops of any great value could be expected from it, so long as it continued under such management. *James Donald.*

Home Correspondence.

Lesson to Landowners.—At the time the Government made known the intention to repeal the Corn-laws, which is now nearly five years since, the owner of an estate of about 4000 acres, situate in the centre of England, alarmed at the prospect which free trade presented, of reduced rent and diminished income, had his attention drawn to the necessity of preparing his tenants for the lower prices they would have to take for the produce of their farms, and sought, in the improvement of his estate, for means to enable them to continue its successful cultivation. The success which has attended his proceedings offers so valuable an example to others, that I trust I shall be excused for giving some account of it. At the period mentioned the estate was divided into farms of 130 to 300 acres, which, tithe free and arable, with valuable pasture, were let at rents of from 15*s.* to 30*s.* an acre. The tenantry, although ancient, had held only by the year; the land, which is naturally fertile, had had scarcely anything done to improve it, and the farmers had little idea of any capability in the soil beyond what their inferior practice had developed. The quantity of pasture upon each farm allowed of a considerable quantity of stock being kept, but as the cattle were grazing all the winter in the meadows, and no provision of winter food, except hay, was given them, the arable land had no benefit from the stock; and its cultivation being upon a course without root crops, and but little assisted by manure, gave only very moderate returns. To tenants so farming, Sir Robert Peel's announcement of free trade created considerable alarm, for they, as well as their landlord, saw little chance of their continuing to do as they had done; but in the improvement of their inferior practice, and in the amendment of the general state and ill condition of their farms, the proprietor was told there would be found ample scope to cover their reductions from free trade, and on this he was told to rely. The assistance of a new land-agent, and from a distant district, was obtained, and he at once saw how much of the imperfect success of the tenants was owing to the ill condition of their farms, and their ignorance of the improved practices which the cultivation of inferior soils had elsewhere called forth; he knew the difficulty there would be in introducing the different practices, which he considered essential to the future successful cultivation of their farms, and he could only hope to effect this by at once destroying their confidence in their past practice, and making them place a higher appreciation of the capability of their soill. He determined on a course which should at once drive them to adopt a different system, and at the same time should encourage them to enter into improvements of their farms. It was with these views that at the first audit the tenants were informed they would each receive notice to quit, but that leases for 21 years would at the same time be offered them, at an advance of rent of 20 per cent.; that permission would be given them to break up certain portions of the pasture of their farms, after they had been drained, upon plans that would be given them; that draining tiles would be allowed them to drain all their land, but the draining was to be done at depths, and upon the plans to be laid down; that their homesteads would be improved, and sheds built to give them accommodation for wintering their stock in yards, and fattening of cattle in stalls; and they would be allowed to remove all unnecessary hedges and trees injurious to the corn; but at the same time their leases would forbid their existing practice of taking two white corn crops in succession; and they would be obliged to dress a fourth of their arable land every year, and other restrictions would be introduced on what they had been in the habit of doing. It was expected in this way they might be made to adopt a more advantageous course of husbandry, and that their farms might be put into better condition, and made more productive, so as to become cheaper to them at the increased rents, than they had been under the old. I must pass over the difficulties of the next three years, the stand made against these measures, the obstacles thrown in the way, the withdrawal of some of the tenants, the objections raised to the deep draining, and the attempting the cultivation of roots where roots had never grown, &c.; fortunately, some of the tenants left, and the readiness with which the vacated farms were re-occupied, and at still higher rents, and the example which the new tenants afforded, who, directed by their leases, at once proceeded to grub hedgerows, to deep drain, and raise Turnips and green crops, and better clean the land, were answers to many of their objections. And now it is to the result I would call attention, which is as follows: this estate now affords a clear rental of 23 per cent. advance on the rental of 1845. The rents are now better paid than they ever have been; the last two audits were held quicker than ever after the quarter days, and at each the whole of the rents were collected without an arrear; and the tenants, with scarcely an exception, admit they are doing well, and their farms are cheaper than they were to them at the old rents; and well they may say so, for such crops as they have had the last two years were never before seen in their parishes. I am aware that such an instance of meeting the requirements of free trade is little likely to have the approval of tenant farmers, and yet how far more truly beneficial has been the course here adopted, than would have been that of the proprietor, seeking to afford relief by reducing his rents. No reduction could have given the same relief, but would have been mischievous. *H. D.*

The want of better Draining of the Public Parks.—My residence in the neighbourhood of the Regent's-park has made me acquainted with the damp state in which this land lies for five or six months in the year, from the want of better draining; and I am a witness to not only how much this interferes with its public utility, but also to what is of far more consequence, namely, to the injurious effect the vapours daily generated from its surface have upon the atmosphere around it. Were the mischief confined to the inconvenience to the pedestrians, I should hardly think of drawing public attention to it, but when I consider how much the climate of the neighbourhood is lowered by the daily rise of moisture from its surface, and how desirable it is that the effect which an undrained surface has upon climate should be better considered, I think the ill state of so large a surface in a populous district is well worth drawing attention to. To the want of more effectual draining, and to the high level of several pieces of water in the Regent's-park, do I ascribe much of the damp condition of the houses which surround it, and the consequent depreciated estimation in which residences are now held in this otherwise attractive neighbourhood. I believe I may go still farther, and attribute much of the fog and raw cold of London in the winter season to the large extent of marshy and undrained clay land which nearly surrounds it. When we consider the effect on the neighbourhood of the alternate daily rise and fall of temperature upon a wet surface, of the exhalations by day and deposit of dew at night, the consequence of the daily alternation of temperature, the importance of making the district round London as dry as possible I think becomes very apparent. I believe it is about 20 years since any general attempt was made to thoroughly drain the surface of the Regent's-park, and I have no hesitation in saying, from my examination of the ground last winter and spring, that whatever means have been used to lay it dry, they have been far from effectual; but this is not at all surprising, for only in the last six or seven years has the effectual draining of clay soils been scientifically understood. Within this period the influence of water upon the temperature of soils was first brought to general attention by Mr. Parkes' valuable communications to the Royal Agricultural Journal, and even now the rise of water by absorption, and the cold generated by the action of the sun upon a wet surface, is only becoming understood so as to point out the occasion for deep drains in clay land to dry the surface. At the time the Regent's-park was drained 20 years ago recourse was had to shallow drains, under the erroneous idea that water had to be admitted into the drains from the surface, and that such soils were impervious to water at a greater depth; but now that experience has shown of how little use is such shallow draining, and how desirable it is to the inhabitants that this ground should be effectually drained, it is to be hoped something now will be done. The bad consequences to health and comfort from a damp atmosphere are so considerable that every means should be used to lessen the sources from which arise our winter fogs and mizzling rains. Of all sources, none are more fruitful than the daily exhalations in the winter from wet Grass land, and we have yet to learn how much our climate may be improved by deep draining. *Hewitt Davis.*

The Cultivation of Wheat.—In an article of the *Agricultural Gazette* a few weeks since, Mr. Mechi alluded to a system of growing Wheat without ploughing, which had been practised by an Essex farmer with great success. I have obtained the following particulars, which may not prove uninteresting to some of your readers. Seven years since Mr. Piper selected an acre of heavy and an acre of light land for this experiment, the surface soil being about 9 inches deep, resting on clay and undrained (Mr. Piper now intends draining it). The plan of the cultivation pursued for the last seven years has been, as soon as the harvest was over, to hand-hoe the stubble and weeds and then to burn them. At the latter end of September or beginning of October (he has commenced a month earlier this season) the seed Wheat was dibbled at 3 gallons to the acre, in rows 12 inches wide, and in holes 4 inches apart in the rows, two or three seeds in each hole, and about 2 inches deep. He has now got one of my dibbles, and finds he can do the work in a more satisfactory manner. Mr. Piper informs me he has not ploughed this land for seven years, neither moved it in any way, excepting, he says, about half an inch deep with the hand-hoe, to clear it from weeds. He states that he has never been troubled with wireworm on this land, and that, when the seed was deposited at defined intervals, he has never had his crop "winter proud," however early he may have sowed. I may here state that the farmers in my neighbourhood are now putting in their Wheat (September 5th), at the rate of 2 pecks to the acre, and I have no difficulty in inducing them to follow my system, as I always guarantee them 40 bushels per acre, provided this be the average, which is more than they can grow on their own old-fashioned plan of throwing the seed on the earth and leaving the rest to Nature. From the appearance of the crops when reaped, I do not think I shall have to pay a farthing this season, and in many instances, where I could superintend the cultivation myself, the yield will surpass by some bushels what I have allowed. But to proceed. The average yield of Wheat in Mr. Piper's neighbourhood is between 7 and 8 sacks per acre, and the following is a copy of the expenses and profit, as given me by Mr. Piper. He has charged 8*s.* per acre for drilling, which he can now get done by machine for 3*s.*; for reaping, 1*l.* per acre, which might be done for 11*s.*; and for hand-hoeing, from 6*s.* to 8*s.* per acre, which might be done for 1*s.*

S. Newington, M.D., Hastings.

Reaping v. *Mowing.*—As this matter has already been pretty fully discussed, I should have thought it unnecessary to have said more on the subject, but for the reason that "W." has accused me of exaggeration and assumption in my last remarks thereon. Had "W." taken my various calculations *seriatim*, and shown one, or more, or all of them, to have been wrong, he might with some degree of justice and reason have impeached me with exaggeration, but not till then; as I allowed and still allow that mowing is cheaper than reaping in the first instance, and that is all he has been able to show throughout a whole column of writing. But "W.'s" manner of treating the question is certainly unique, as he not only launches off about exaggeration and assumption, without offering the least proof or calculation for his assertions, but assures us that his object is not to oppose "R. V.'s" assumption, but merely to state the matter at issue in a fair light. Well, as my object is now to gain a notch from "W." respecting his mowing, I would very much like to know what kind of crops he grows, and what kind of men, women, and children he employs to get over 2 acres a day to a scythe? I can assure "W." that such information is most desirable in these days of distress, when farm labour well nigh swallows the produce of the land. I am also certain that his "go-ahead" system will be hailed as a boon throughout her Majesty's dominions, if he can only put others in the way of doing things as cleverly as himself. We never before heard nor read that 10 scythes could cut down 20 acres of corn a day on an average for harvests together. We dare not dispute "W.'s" assertions, but may reasonably presume

that his crops are meagre or that his men are monsters. "W.'s" calculation about the different length, weight, and bulk of stubble left between the methods of cutting high and low, is not quite correct as a rule for the crops in those parts we are acquainted with. I tested the weight of a long length of stubble, next the ground, an equal length of straw next the corn ear, and found that 15 inches of stubble equalled in weight 2½ feet of straw, measuring from the ear. Therefore if the length of the stem before being cut measures 3 feet 9 inches, and 15 inches of stubble is left behind, there is then nearly half the bulk, and quite 50 per cent. of the entire weight of straw left on the ground, instead of 5 per cent., as "W." states. In some cases we have seen 18 inches of stubble left after reaping high; when there were about three cart loads of corn in the straw, and three loads of stubble per acre. In such cases the crops have ranged from 35 to 45 bushels per acre, and the entire straw and stubble weighed about 2 tons. It is easy for "W." to impute "exaggeration" to me, and equally easy it appears to assume a mistaken theory in support of his own system, while it is just as easily and simply put down. I have seen the mowing of Wheat partially carried on a dozen years ago on some of the largest and best managed farms of Bedfordshire. I know it has been prosecuted off and on for some years on three farms, where it is now abandoned for reaping. I have seen labourers prefer the sickle to the scythe when allowed their choice, when cutting down at a certain price per acre. All that goes to show that mowing has been well and truly tried, and found wanting in cases of large crops. I am, however, fully aware that mowing is successfully carried on in some parts, so far as celerity and less expense, in the first instance, goes; but that does not settle the question as to which is the best and cheapest method of the two—mowing or reaping—from the time of cutting down till the straw be made into manure and the corn be prepared for market. Why should from 20 to 30 cwt. of straw be unnecessarily moved four times instead of carrying the great bulk of the straw at once from the field to the yard where it is be consumed? Cannot the ears of corn be threshed out without passing all the long straw through the machine? To show that I am not at all singular in my ideas regarding this matter, I beg the insertion of the following letter from the *Bucks Advertiser* of last week. The writer is quite unknown to me, but his opinions exactly coincide with my own, and with those of farmers generally. "*Short Shearing in Reaping.*—The general use of threshing-machines has caused many farmers to make new calculations as to the best method of cutting and harvesting Wheat; and the result of these calculations has almost invariably been a return to the old system of cutting the corn high up the stalk, so as to have as little straw with the ear as possible. The systems of cutting close to the ground, and of mowing, which had come into vogue of late years, have, during the present harvest, been abandoned by most intelligent agriculturists, as being the most expensive in the end, though they offer an immediate saving of expense. When Wheat is reaped high up, it is necessary to go over the ground a second time, in order to reap or mow the straw, for we cannot in this country afford to do as is done in Australia and America, where the farmer clips the ears of corn short off, and leaves the straw to be ploughed in upon the land. We want the straw for manure; which the Australian and the American farmers, having an abundance of fresh land, care little or nothing about. Here, then, is the immediate advantage which the mowers and low-cutters have over the high-shearers of corn. But when the corn comes to be threshed, it is found that the rapidity and ease with which the machine works upon the short-cut, compared with its operation when cumbered with the long straw, give a saving in this part of the process in favour of the high-sheared corn, which more than makes up for the extra expense of the men having had to go twice over the fields. There are other advantages in favour of the short-reaped Wheat, as to carrying and thatching, which are important. But it is the economy in threshing which is decisive. When the flail was used, little attention was paid to such details. One of the great advantages of the introduction of scientific machinery into agricultural operations is, that it makes men observe and calculate exactly the comparative celerities and expenses of different processes. This leads to accuracy, to improvement, and to good order; instead of the old slovenly system on which farmers used to keep their reckonings, like their lands, very much in the rough." I shall certainly be delighted to learn further particulars regarding the way to set about mowing Wheat at 5*s.* per acre, and other crops at 3*s.* 9*d.*, including beer. The prices for reaping, through Bedfordshire and Buckinghamshire, have this harvest ruled from 7*s.* 6*d.* to 13*s.* per acre. We have heard of no mowing being done under 7*s.* per acre. Neither did we see any account at anything like "W.'s" price, in all the accounts from the various parts of England, published in last year's *Gazette*. Corn cut down, tied up, shocked, and raked, at an average of 3*s.* 9*d.* per acre! Why we shall be rejoiced to know how this can be done universally, and shall most certainly be three-fourths converted from reaping to mowing by a solution of that knotty point. *R. V., Sept.* 9.

To make Beer with Sugar.—When the act passed authorising the use of sugar in breweries, it was supposed that such method of manufacture would be very generally adopted. That this has not been the case may be partly attributed to the low price of malt, and partly to a faulty mode of employing the materials, which has caused the experiment to fail in many instances, and given rise to the idea that beer made from sugar will not keep. The principal error fallen into by the brewers has been the practice of boiling the sugar with the wort. This is a great mistake; the sugar should never be boiled in any stage of the operation. I have tasted most excellent bitter beer, made according to the subjoined receipt, having perhaps more briskness of flavour than beer made in the ordinary manner; and the chief advantage of which, as I was informed, consisted in the length of time for which it would keep without becoming hard. I have since heard of a brewery in Surrey, where, in consequence of the use of sugar, the spoiled beer returned by the various customers during the year was so much reduced as to be barely sufficient for their finings. The present price of sugar, of the quality fit for brewing, is about 30*s.* per 112 lbs., and it is calculated that 50 lbs. of sugar are about equal to 2 bushels of malt. *Recipe:*—Boil 54 gallons of water in a copper; run it into a mash-tub, and let it cool to 90° Fahr. Put in 4 bushels of malt; let it stand three hours, covered with sacks, &c., to keep steam in; run into underback, and immediately pump into copper. Mix, and stir 8 lbs. of Hops with it. Boil three hours; run in trough to cooler, mixing 25 lbs. of sugar, with the hand, in the wort as it runs along the trough. Cool to 70°; and let down into working-tub. Make a second wort in precisely the same way as the first, with the same malt and Hops, and 25 lbs. more sugar; cool it separately, and mix it with first wort in the working-tub. Put one pint of yeast into flat-bowl; put bowl into wort, so that wort can just touch yeast. Let it work 12 hours, during which time skim off yeast three times. Keep it covered except when being skimmed; and back off into casks in cellar. It may work a fortnight. Fill up the casks every morning with what has worked out of the cork hole into the tub beneath. Skim it before returning it to cask, cleaning away all the yeast which rises to the top of the cask through the bung-hole. Put three or four handfuls of dry Hops into cask through bung-hole, and bung it up. If very strong beer is required, keep the first wort by itself. If the usual strength is sufficient (4 bushels of malt, 50 lbs. of sugar, and 8 lbs. of Hops), make 108 gallons of beer. The sugar should be of a strong grainy quality. *Another Method of Mixing Sugar:*—Immediately before running wort into cooler, take out of copper two pailfuls of wort, and empty into small cask. Mix sugar with it. Pour back into copper, mixing thoroughly, and directly run it off into cooler. Do not boil wort after sugar is added. *Stephen Cave.*

On the Nutrition of Plants. By Prof. Magnus. (*Continued from p.* 590.)—In other similar experiments, also, which the author made, the injurious influence of salts was equally distinctly perceptible. Thus, instead of the carbon, a coarsely-powdered felspar, which occurs at Silesia near the Schreibersau, and is used at the porcelain manufactory of Berlin, was employed. It had been powdered at this manufactory by an iron stamp. Part of it was used in a pure state; to another part all the above-mentioned salts were applied, and of these to 100 parts of felspar—

	per cent.
Carbonate of lime	2.0
Carbonate of magnesia	2.0
Protocarbonate of manganese	0.5
Sulphate of lime	1.0
Phosphate of lime	2.0
Chloride of sodium	0.5
Silicate of potash	1.0
Spathic iron ore	1.0
	10.0

The spathic iron, from its insolubility in aqueous solution of carbonic acid, appeared better adapted for experiments upon vegetation than peroxide of iron which has been heated to redness, for this is perfectly insoluble. That used in these experiments came from Lobenstein, and according to an analysis by Hagen contained—

	per cent.
Protoxide of iron	45.79
Protoxide of manganese	11.34
Lime	1.08
Magnesia	3.25
Carbonic acid	39.27
	100.73

An experiment was also made, in which the same salts, with the exception of the phosphate of lime, as well as a third, in which all the salts, with the exception of the silicate of potash, were mixed with the felspar. Three small porcelain pots were filled with these three mixtures, and three or four grains of Barley placed in each; water was then poured over them. The grains however did not spring up. The three spoiled grains were then removed, and each of the three mixtures exhausted with distilled water. When three porcelain pots were now again filled, and the grains of Barley placed in each, the plants in all the three mixtures attained on an average a height of 14 inches, and sent forth some five, others seven leaves. Besides these mixtures, some grains of Barley were also placed in pure felspar. They attained a height of 15 inches, and produced seven perfect leaves. All the plants then produced ears, and one of them brought forth two perfectly-developed grains; whilst in all the other experiments, both with carbon and felspar, no trace of ear was apparent. The plants produced in the pure felspar also were of such strength, that even after the lower leaves had perfectly withered, new shoots were sent out from at least two of them. A perfectly similar result was yielded by an experiment in which the same felspar was used, a third part of which however had been ground fine and elubriated, the same substance from the porcelain manufactory being again made use of. In this case, one plant attained a height of 20 inches, and produced four perfect grains. The plants in this finely-granular mass were altogether stronger than those in the coarse felspar, but their first evolution occupied a much longer time than in the latter. The two latter experiments show the great influence of the mechanical structure of the soil upon vegetation. In both the same felspar was used; both were begun at the same time, and carried out under exactly similar circumstances; but the progress of vegetation in the two was totally different. In the coarsely-powdered felspar the grains had all sprung up at the end of five days; whilst in the fine they had required eight days. For the latter had become so hard and solid by being moistened with water, that a hole could hardly be bored in it with a pointed iron; it was therefore natural that the leaf-bud which was formed could scarcely force its way through it. But when the plants had attained a height of 5 inches, those in the fine felspar appeared much stronger, and surpassed the former in their vegetation. This probably arose from the circumstance, that the finer mass retains moisture better, and absorbs carbonic acid and ammonia from the atmosphere in larger quantities. Moreover, it might also happen that the felspar was partially decomposed, and that this decomposition took place more easily in the case of the fine than the coarse. But that the vegetation took place so much better altogether in the pure felspar than in that treated with salts, even when the soluble portion of the latter was removed by exhaustion with water, affords proof of the small quantities of salts required by the plants for their nutrition, and how injurious is the presence of larger quantities. *Monatsbericht der Akademie der Wissensch*, zu Berlin, Feb. 1850, pp. 60-71. *Chemical Gazette.* (*To be continued.*)

Calendar of Operations.

SEPTEMBER.

Bedfordshire Farm.—The harvest has for some time been concluded, and as usual, preparation is going on for another crop. The horses here have lately been employed in carting clay upon a light sandy soil; and in ploughing and cleaning the Wheat stubbles for Rape and Tares. The clay is filled and spread for 3*d.* per two-horse load. About 80 loads are applied per acre. In breaking into a clay pit, much more labour is required to fill a certain number of loads than when a pit of considerable depth is obtained. It is therefore a necessary consideration, what price should be given for filling clay, according to circumstances. Our men earn nearly 2*s.* per day at clay cart, at the rate of 3*d.* per load, filling from a pit about 7 feet deep, and 20 feet wide. Claying land is rather expensive, but an indispensable and permanent improvement on the lightest sands. The crops of last harvest are much inferior in point of yield to those of last year. In a field of ours, which promised some 40 bushels or more per acre, six weeks before harvest, the actual result from threshing has turned out but little more than 30 bushels per acre. The field in question was made the subject of some experiments. Part of it was drilled at intervals of 9 inches apart, at the rate of 6 pecks per acre; part was sown broadcast, at the rate of 6 pecks per acre; part was dibbled, at the rate of 5 pecks per acre; and part was dibbled with Dr. Newington's patent implement, at the rate of 4 pecks per acre. The drilled part turned out more by about 3 bushels per acre than the dibbled part; while the part which was broadcast (although not proved), appeared inferior to either the drilled or dibbled. It is but fair, however, to state, that although the drilled part of the field produced the greatest yield, the land was superior to the dibbled part. About an acre of that planted with Dr. Newington's dibble failed, from the ravages of slugs, &c. This was filled up in March by transplanting, and at harvest was quite equal or superior to any other part sown in the usual way. We have never seen transplanting fail when properly performed at a proper time; that is, that the plants were firmly fixed in the soil when the land was neither too dry to prevent the plant from gaining root, nor too wet to be puddled by the feet of the planters. A person told me some time ago that he found it an excellent preventive against wireworm on old lea to plough frequently in winter, in snow, if possible, which destroyed the eggs of the vermin. He also told me of a novel method of recovering wireworm-eaten Wheat, by treading. He said two labourers came to him asking for employment at a time when he required no *hands* for common work. He observed, however, that the men appeared to have unusually *great feet*, and thought they would just do to tread the wirewormy Wheat, which he proposed to them. The men at first did not like the job, and said it looked like making fools of them. However, after a little encouragement, they set to work, and saved several acres of Wheat in a field where part was not trodden, and failed completely. Heavy rolling has long been known as useful in destroying wireworm; but as the effects of the heaviest roll is not much felt an inch below the surface, very little good frequently results from rolling. Preparation is at present going on around us for sowing winter Beans. From appearances winter sowing will soon usurp the place of spring planting. The usual quantity of seed used here, is from 3 to 4 bushels per acre. About the same quantity of Tares are sown per acre. Trifolium is now being sown in considerable quantities; it is more adapted for light than heavy soils. About 20 lbs. per acre is a good seeding. Where summer fallows once prevailed, a crop of winter Tares is now generally sown. The land is first dunged, where a good crop is obtained; if the land is foul, it requires ploughing as frequently as the weather will permit after the crop is consumed. On arable farms, sheep are now turned upon Turnips, and fatting cattle are being stall-fed on roots, &c. The pigs are living partly upon the corn stubbles, and partly upon roots. Many breeders of pigs keep the boar from the sows for a month or two after this time. Some however, who have good accommodation for housing young pigs, keep breeding all the year through. Potato digging is now occupying many hands. In a circle of 10 miles circumference from this, there are supposed to be upwards of 500 acres of Potatoes grown. The roots are more free from disease than for several years past. The current prices for digging and dividing into three sorts is 1*l.* per acre, or 1*s.* 6*d.* per score bushels. Many Potato growers prefer pitting in the ground to house storing. The pitting system retains the freshness, moisture, and weight of the roots better than the house storing; but when turning is necessary, the latter system is the best. Labourers are now well employed. The usual wages are from 8*s.* to 10*s.* per week. Hours, from 6 to 6 o'clock. Piece-work is becoming more common, and no doubt would prevail more if the farming community were more acquainted with the various kinds of measurement. *R. V.* [Will "R. V." be kind enough in future to send his contributions to our calendarial section one post earlier.]

Notices to Correspondents.

COCHIN CHINA FOWLS: *P A H.* We have been in correspondence with the parties referred to, in consequence of your letter, and the following is the conclusion arrived at: "There is nothing in 'P. A. H.'s' description of the eggs to disprove their being genuine Cochin China. Richardson's statements are not infallibly to be relied on, and their long journey is a sufficient reason for so small a number of chickens being hatched from them. I now never attempt to hatch eggs brought from a great distance, *unless I could fetch them myself.* I would give no opinion about the one surviving chicken without seeing it. It *may* be a pure bird, though strange-looking in its youth. *D.*"

DAIRY MANAGEMENT: *Rev. R. C.* says, "I see in my paper this week a statement respecting the management of a dairy and the produce of it. If you or any of your correspondents could supply a similar statement about a Devonshire dairy, I think it might be interesting and useful to some of your west country subscribers." [It is better to place the milk in the pans directly it comes from the cows.]

HARD AND BRITTLE HOOFS: *J S.* Barbadoes tar and Olive oil; mix and anoint the feet daily. *W. C. S.*

LUCERNE: *Old Sub.* Sow 10 lbs. per acre in shallow drills 12 inches apart, in the end of April, on a deeply and richly tilled soil of a loamy character.

POULTRY HOUSE: *Sub.* We must refer you to "Ornamental Poultry," 2d edit., p. 225-8; "Walter B. Dickson on Poultry," p. 28-42; "Farming for Ladies," Chap. I. Woodcuts and a description of a well-arranged fowl-house are in preparation for a forthcoming number of Blackie's "Cyclopedia of Agriculture."

SHIELDRAKES: *Sub.* A sufficiently full account of these birds in captivity on fresh water lakes, cannot yet be given, for want of room. We cannot tell the cause of the blindness. Corn alone will not keep them in health; in a state of nature the greater part of their sustenance is obtained on the sea-shore—a shell-fish diet. They are fond of cockles and small mussels.

THE MANGE: *J L.*, next week. In the meantime we refer you to a shilling book, by Richardson, on "The Dog."

THISTLES: *H.* must just "pull, hoe and spud" again. There are instances enough on record to prove the accuracy of the popular idea that this will ultimately destroy the weed.

ERRATUM: In page 585, col. *b*, for "The depths of this point will obviously be greatest where the capillary force is greatest; and as this approaches its maximum in the stiffest soils, so these drains must be cut the deepest," *read* "The depth of this point will obviously be greatest where the capillary force is greatest; and as this approaches its maximum in the stiffest soils, so, *there*, drains must be cut the deepest."

*** Communications reaching town after Wednesday cannot be answered till the following week.

Markets.

COVENT GARDEN, SEPT. 21.

Vegetables are abundantly supplied. Hothouse Grapes and Pine-apples are plentiful; Peaches and Nectarines from the open walls abundant. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent. Filberts are plentiful and good. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are good and cheap. Lettuces and other salading are sufficient for the demand, and so are Mushrooms, but owing to the dry weather the latter are not good. French Beans are scarcer. Cut Flowers consist of Heaths, Pelargoniums, Carnations, Picotees, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosissima, Japan Lilies, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Pears, per doz., 1s to 3s
Grapes, hothouse, p. lb., 2s to 5s	Lemons, per doz., 1s to 3s
Peaches, per doz., 1s 6d to 6s	Oranges, per doz., 2s to 3s
Nectarines, p. doz., 1s 6d to 4s	— per 100, 8s to 24s
Apricots, per doz., 1s 6d to 5s	Almonds, per peck, 6s
Figs, per punnet, 2s to 4s	— sweet, per lb., 2s to 3s
Melons, each, 1s to 3s	Walnuts, p. 100, 1s 6d to 2s
Plums, p. punnet, 1s to 1s 6d	— p. bush., 16s to 24s
Green-gages, do., 1s to 2s	Nuts, Barcelona, per bush., 20s to 22s
— per sieve, 8s to 10s	— Brazil, p. bsh., 12s
Apples, dessert, p. bush, 4s to 8s	Filberts, per 100 lbs. 22s to 30s
— kitchen, do., 1s 6d to 6s 6d	

VEGETABLES.

French Beans, p. sieve, 3s to 4s	Garlic, per lb., 4d to 8d
Cabbages, per doz., 6d to 1s	Artichokes, p. doz., 2s 6d to 3s
Cauliflowers, p. doz., 2s to 4s	Vegetable Marrows, per doz., 6d to 1s
Peas, per sieve, 3s to 6s	Lettuce, Cab., p. sc., 1s to 1s 6d

COAL MARKET.—FRIDAY, Sept. 20.

Eden Main, 15s. 3d.; West Hartley, 16s. 6d.; Wallsend Haswell, 16s. 3d.; Wallsend Stewart's, 16s. 3d.—Ships at market, 28.

HOPS.—FRIDAY, Sept. 20.

Messrs. PATTENDEN and SMITH report that at Worcester Fair yesterday about 1400 pockets of new Hops were pitched, and about 715 sold, at prices varying from 75s. to 80s.; choice, 82s. Very few of the best growths sold, the planters not submitting to these prices. Duty for the district, 20,000*l.*; and for the kingdom, 210,000*l.* to 215,000*l.* A good demand for new Sussex and Weald of Kents this morning.

SMITHFIELD, MONDAY, Sept. 16.

The continuance of dry weather causes a large supply of stock to market, and a large proportion are in very middling condition; consequently still a few of the choicest Scots make 3s. 8d., but so rarely we cannot quote it. Trade is exceedingly dull for Sheep, and our top quotations are with difficulty obtained. The supply of Calves is larger than the demand. From Holland, Germany, and Denmark there are 1031 Beasts, 3270 Sheep, and 198 Calves; and 3000 from the northern and midland counties.

Per st. of 8 lbs.—s d s d	Per st. of 8 lbs.—s d s d

Beasts, 4629; Sheep and Lambs, 31,820; Calves, 294; Pigs, 280.

FRIDAY, Sept. 20.

The number of Beasts is very large, and the demand small; consequently lower prices are taken, and many remain unsold. There are considerably more Sheep than are wanted; a few are sold at rather lower rates. Trade is exceedingly dull for Calves at very low prices. Our foreign supply consists of 629 Beasts, 1380 Sheep, and 171 Calves. We have 81 Milch Cows from the home counties.

MARK LANE.

MONDAY, Sept. 16.—The supply of English Wheat by land carriage samples this morning from the near counties was moderate, and disposed of at an advance of fully 1s. per qr; the demand for foreign was not extensive, but some of the inferior qualities and finest red command extreme prices.—Malting Barley must be written 1s. per qr. cheaper; the value of Grinding is maintained.—White and Maple Peas are 2s. to 3s., and Dun 1s. per qr. dearer.—Beans are inquired after, and a shade higher.—Oats meet a ready sale; for the finest qualities rather more money is obtained.

FRIDAY, Sept. 20.—Excepting foreign Oats, of which the supply is large, the arrivals of grain either from our own coast or abroad have been moderate; this morning's market was thinly attended, and the sale of all descriptions of corn was limited. Holders, however, are very firm, and on the business transacted Monday's quotations are fully supported.—Flour being held on somewhat higher terms, restricts sales.

LIVERPOOL, FRIDAY, SEPT. 13.—There have been better supplies of Oats and Oatmeal from Ireland during the last three days, but the principal import is from France, whence we have received nearly 10,000 qrs. of Wheat, and 11,179 sacks of Flour. At this morning's market the sales of Wheat and Flour proceeded slowly, but in all cases fully Tuesday's prices were obtained. Fine mealing Oats are scarce and wanted, those offering to-day were of inferior quality, and not saleable. Grinding Barley has become scarce, and was 1d. per bushel dearer. Beans and Peas were each also 6d. per qr. higher. Indian Corn was the turn dearer to-day, and 28s. per 480 lbs. is the value of the best American yellow.——TUESDAY, SEPT. 17.—There is little increase in the supplies of grain, &c., from Ireland this week, consisting of the new crop. We have had remarkably fine weather for finishing up the northern harvest. The trade for every article has been very firm throughout the week, with a steady business going forward. The trade in Wheat at this morning's market was tolerably steady, considering the extent of the foreign arrival. The business transacted was only moderate, and in some instances, from the ship, 1d. per bushel decline on last Tuesday's prices was submitted to. Flour was in fair request, and late prices were supported. Grinding Barley was 1d. per bushel, and Egyptian Beans 6d. per qr. higher. Oats were in limited request, and rather easier to buy. Peas were fully as dear. No transactions in Indian Corn transpired, and last week's prices are continued.

LADIES AND GENTLEMEN'S DRESSING CASES.—MECHI, 4, Leadenhall-street, London, invites an inspection of his STOCK, which possesses peculiar advantages both in quality and price. There is a general complaint that the internal fittings of Dressing-cases are often very inferior. Those who purchase at MECHI'S will be sure of having everything of the best, because he has long been celebrated for the superiority of his Cutlery, and has bestowed equal pains in bringing to perfection his Tooth, Nail, Hair, and Shaving Brushes, and other necessaries. In fact, he considers it essential that each article in a Dressing-case should be perfect in itself, so as to render the whole useful and complete. Those who desire to have particulars may obtain a Catalogue gratis. The largest assortment in London of Papier-maché manufactures, and the usual stock of articles suited for presents. MECHI'S Peculiar Steel Razors, 7*s.* and 10*s.* per pair. His Magic Strops, 2*s.* 6*d.* to 6*s.* 6*d.*; paste, 6*d.* and 1*s.* per cake. Cutlery ground and repaired daily on the premises.

LIFE ASSURANCE AND GUARANTEE.

THE UNITED GUARANTEE AND LIFE ASSURANCE COMPANY, 36, Old Jewry, London.

Capital 100,000*l.*, with power to increase to 500,000*l.*

Three-fifths of the Profits of this Company will be divided among the assured; and the first division will take place at the expiration of the First Quinquennial period in 1854, after which the Bonuses will be added annually to the Life Policies. No charge is made for Policy Stamps.

The RIGHT HONOURABLE LORD ERSKINE, Chairman.

JOSHUA P. BROWN WESTHEAD, Esq., M.P., Vice-Chairman.

This Company transacts the following description of business:—

1. Life Assurance with participation in Profits, or a Low Scale of Premium without participation, at the option of the Assured.

2. Guarantee for Fidelity.

3. The Union of Life Assurance with Guarantee for Fidelity, so that the Life Assurance Policy is made conditional on the continued honesty of the Assured. The leading advantages of this plan may be thus summed up:—

TO EMPLOYERS.—The Union of a Life Assurance Policy with a Bond for Fidelity gives an additional Guarantee for the honesty of those employed in situations of trust, who by any dereliction of duty would forfeit their Life Policy.

The Life Policy also becoming from year to year more valuable, offers an annually increasing stimulus to continued good conduct, and each Premium, considered as an investment by the clerk or officer, is an additional assurance to the employer of the honesty of his intentions.

TO THE EMPLOYED.—A considerable Reduction of Premiums on the two risks. This saving is effected on the ground that the Company can only be called on to pay one or the other of the risks incurred; for if the Employed continue honest, the Life Assurance Policy only becomes a claim, whilst, if he is dishonest, the Life Assurance Policy is forfeited.

Prospectuses and further information may be obtained upon application at the offices of the Company, or to any of the Company's Agents.

By order, JAMES KNIGHT, Secretary.

HARTLEY'S PATENT ROUGH PLATE GLASS, JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS.

An illustrated Catalogue, with Testimonials and Treatise on the different methods of Seeding may be obtained gratis on application to Messrs. DUFAUR and Co., 21, Red Lion-square, London.

LAND DRAINING AND IMPROVEMENT COMPANY, 30, Parliament-street, London; and Bedford Circus, Exeter.

This Company having been in active operation for several years, is ready to undertake Works under the Government Loan, or by fixed or annual charges under its Act of Parliament.

Further particulars and references may be obtained at the offices. THOMAS MAY, Secretary.

TO FLORICULTURAL AND HORTICULTURAL SOCIETIES and Others.—The following MARQUEES, having been bought under an execution, are TO BE SOLD reasonably, as second-hand:—250 feet by 28 feet, 180 feet by 40, 150 feet by 28, 120 feet by 33, 110 feet by 30, and 96 feet by 36.—Apply to BENJAMIN EDGINGTON, Marquee, Tent, and Rick-cloth Manufacturer, 2, Duke-street, Southwark, London.

THRESHING MACHINE FOR SALE.

HOLLAWAY AND SON are instructed to sell by Auction, on WEDNESDAY, 24 October, a THRESHING MACHINE (nearly new), adapted for Steam or Water Power, producing at one operation a sample ready for market, and (being fitted with Clyburn's Separater) perfectly uniform in size. Also a most valuable collection of Agricultural Implements, many of them prize ones at the Royal Agricultural Society's Shows, and selected from the best makers, regardless of distance. Also 300 prime Leicester Sheep, store beast, &c., the property of Mr. JAMES BIGGS, Desborough, Northamptonshire, who is leaving his Farm. The machine may be seen in operation from 9 to 11 o'clock on the morning of Sale, at which hour the Sale will commence. Desborough is five miles from Market Harborough Station, Rugby and Stamford Railway,

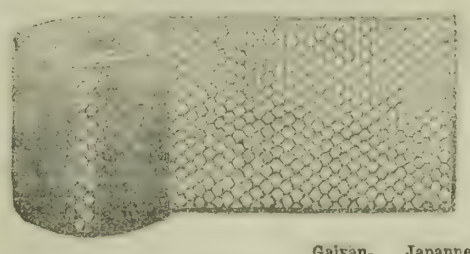
FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:



Size.	½ in.	⅝ in.	¾ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0s. 5d.	0s. 6d.	0s. 8d.	0s 10d.	1s. 0d.	1s. 2d.	1s. 4d.	1s. 6d.
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

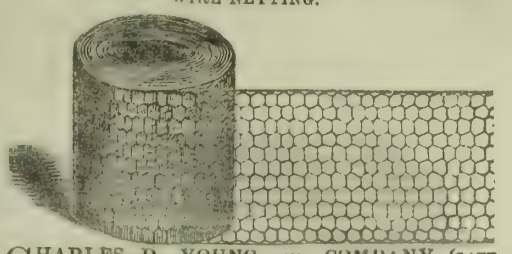
All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7d. per yd.	5d. per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
1⅝-inch ,, light ,,	...	8 ,,	6 ,,
1⅝-inch ,, strong ,,	...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.



Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the Teeth! Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed Teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designated unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. Rowlands' Odonto, or Pearl Dentrifice, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*

ROWLAND'S ODONTO

Is a white powder compounded of the choicest and most *recherché* ingredients of the oriental herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Price 2s. 9d. per box.—Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	..	£3 15 0
Do. of 100 yards, 24 ins. wide	..	..	5 0 0
Do. of 100 yards, 30 ins. wide	..	..	6 5 0
Do. of 100 yards, 36 ins. wide	..	..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2½ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

AGRICULTURAL EDUCATION.—E. MURPHY, A.B., Professor of Agriculture in Queen's College, Cork, is prepared to receive as boarders in his family a limited number of young gentlemen whose parents or guardians may desire to obtain for them a superior Agricultural Education.

A prospectus of the Agricultural and Engineering Schools of Queen's College, with terms, &c., will be forwarded on application as above.

GERMAN SPRING MATTRESSES, permanently elastic, very durable and cheap.

One of these Mattresses, with a French Mattress on it, is a most excellent and soft bed. HEAL AND SON'S List of Bedding, with full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post.

HEAL and SON, Bedding Manufacturers, 196, opposite the Chapel, Tottenham-court-road, London.

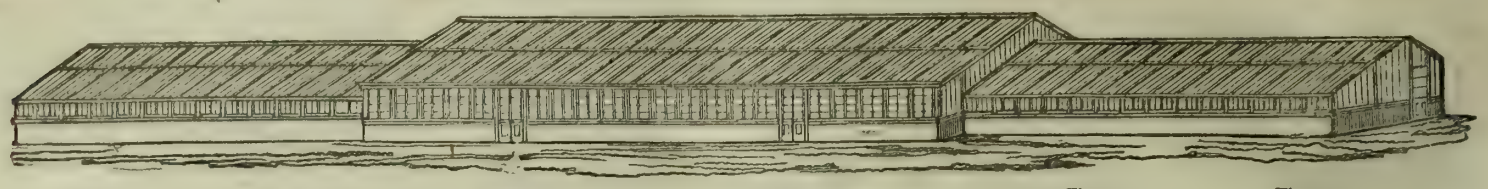
METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S" adopted by some houses.

THE BLOOD.—Our bodies have been entirely formed, *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame; and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*

PARR'S LIFE PILLS.



It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.

None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the directions.—Sold in boxes at 1s. 1½d., 2s. 9d., and family packets at 11s. each, by all respectable medicine vendors throughout the world.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

DALSTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions by Mr. J. SMITH to submit to an unreserved sale by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, Sept. 23, and two following days, at 11 o'clock each day, in consequence of the Lease being nearly expired, the whole of the valuable GREENHOUSE PLANTS, comprising several thousands of choice DOUBLE CAMELLIAS, from 18 inches to 10 feet, beautifully furnished with bloom buds; Azalea indica, Epacris, Ericas, Daphne indica, Pimelea, Corræa, Cassia, Corymbosa, Erythrina, Diosma, Nerium, Plumbago, Kennedya, Chorozema, Gardenias, Geraniums, Chrysanthemums, Cactus, Fuchsias, Myrtles, Acacia, Heliotropes, Aloes (sorts), Hydrangeas, China Roses, Statice, Magnolia grandiflora (ex.), Viola arborea, Calceolarias, Verbenas, Lobelias, &c.—May be viewed, and Catalogues had (6*d.* each, returnable to purchasers), one week prior to the sale, of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HATTON NURSERY, NEAR HOUNSLOW, MIDDLESEX. TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

20,000 Scarlet and other Rhododendrons, 20,000 Ghent and other Azaleas, 2000 Andromedas, 6000 Kalmias, 2000 Hardy Heaths, 1000 Daphne Cneorum, 3000 Cedar of Lebanon, 1 to 4 feet, in pots, 300 Pæonia arborea; also a large quantity of Seedlings of sorts.

MESSRS. PROTHEROE AND MORRIS are directed, by the Executors of the late Mr. John Ronalds, to offer to an unreserved sale by Auction, on the premises, Hatton Nursery, near Hounslow, Middlesex, about 1½ mile from the Feltham Station, on MONDAY, October 14, and following day, at 11 o'clock, the whole of the valuable NURSERY STOCK, consisting of a large and rich assortment of American Plants, Evergreens, and Deciduous Shrubs, comprising Laurels, Irish Yews, Pinus of sorts; Spruce, Scotch, and Larch Firs; Lime, Alder, Ash, Plane, a large quantity of Quick, three fine specimens of Cedrus Deodara, 8 to 10 feet, &c.—May be viewed prior to the sale. Catalogues had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

N B. The whole of the valuable Stock of the Butts and Toolans Nurseries will be sold by Auction, on Monday, Oct. 21, and following days.

TONG PARK FARM, SALOP.

EXTENSIVE and IMPORTANT SALE of Live and Dead FARM STOCK, Wheat, Barley, Beans, Turnip Seed, Potatoes, Hay, FURNITURE, Fixtures, Brewing and Dairy Articles, Ale Casks, and other Effects.

MR. THOMAS PAGE has the pleasure to announce that he is instructed by Mr. William Bradburn, of Tong Park, to offer by Auction, without reserve, on MONDAY and TUESDAY, September 23d and 24th, 1850, upon the premises, the following valuable LIVE AND DEAD FARM STOCK, Wheat, Barley, Beans, Potatoes, Turnip Seed, Hay; Furniture, Brewing and Dairy Vessels, and other effects, viz., 31 Head of Horned Cattle; 14 Waggon and Half-bred Horses, Mares, Colts, Fillies, and One Entire Horse; 50 Cross-bred Store Ewes and Lambs; 13 Sows, Gilts, and Store Pigs; Quantity of Poultry; 10 Capital Waggons and Carts, Iron Cultivator, Rolls, Harrows, Ploughs, Drills, Scuffles, Straw Engines; Three Turnip Cutters for Cows and Sheep, Weighing and Winnowing Machines, 15 Sets of Gears, Dog Cart, Harness, Saddles and Bridles, Go Tackle, 100 strong Hurdles, Wood Hurdles, 500 yards of Sheep Netting, with about One Ton of Iron Stakes, Rick Frames, Rick and Waggon Sheets, Ropes, and the usual assortment of Smaller Implements and Tools. Also, about 35 tons of Capital well ended Upland Hay, in Trusses, to go off. Three thousand Bushels of Barley. One thousand Bushels of Wheat. Three hundred Bags of Beans. Upwards of five tons of Swede and common Turnip Seed, of the present year's growth, from transplanted Turnips, being the produce of 11 acres of Land, and an excellent and well gathered crop, in suitable lots, and at the present in the chaff, consisting of 150 bags of purple rind Swede Turnip Seed; 50 bags of green rind Swede Turnip Seed; 50 bags of mixed rind Swede Turnip Seed; 20 bags of green Globe common Turnip Seed; 10 bags of red and white Norfolk Turnip Seed; 10 bags of Early Stone Turnip Seed. About five acres of Potatoes. Also, the useful Household Furniture, China, Glass, Fixtures, Boilers, Ale Casks, Brewing Vessels, and other effects, in and about the aforesaid premises, particulars of which may be had in the Catalogues from the Auctioneer; at the place of Sale, and at the principal Inns in the neighbourhood. On account of the great number and importance of the Lots, the Sale will commence punctually at 11 for 12 o'clock to a minute each day.

TO NURSERYMEN, FLORISTS, AND OTHERS.

TO BE LET, for a term of 52 years, a very compact NURSERY BUSINESS, containing about 2000 feet of Glass, and a fine Stock of Plants, consisting of Camellias, Ericas, Geraniums, &c. This offers a good opportunity to persons desirous of going into the above line with a small capital. For further particulars enquire of Mr. BROADBRIDGE, Priory Nursery, Larkhall-lane, South Lambeth, London.

WANTED, on a Lease, a PIECE OF GROUND, from a quarter to half an acre, for a Florist's business; or any person having a small place to dispose of containing two, three, or four greenhouses, are desired to apply by letter, stating all particulars, to A. B., Earl of Lonsdale's, Westbourne-grove, North Bayswater.

TO BE LET, a FARM of 144 acres, tithe free, and good Wheat, Bean, and Hop land, with a new Farmhouse and Buildings in repair—at Michaelmas. Rent, 80*l.* a year.—For particulars apply to Mr. CURTIS, Fairlawn Park, Sevenoaks, Kent.

This day is published, price 5*s.* 6*d.*, in cloth boards,

The Band of the First Life Guards will perform FOR THE LAST TIME THIS SEASON on Saturday next, Sept. 28, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

AN ADMIRABLE REMEDY ARE HOLLOWAY'S PILLS FOR BILIOUS COMPLAINTS AND INDIGESTION.—The efficacy of these invaluable Pills in the Cure of Bile, Indigestion, Flatulency, Sick Headaches, Nervousness, and debilitated constitutions, is so thoroughly established in almost every part of the world, that they now stand pre-eminent as the first Medicine ever known for these complaints, and may be taken by persons of all ages, and in every climate. They invigorate the body, strengthen the faculties of the mind, increase the appetite, and purify the blood. Those who suffer from disease brought on by sedentary occupation, may rely on these Pills giving immediate relief, and a certain restoration to good health.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for Softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, SEPTEMBER 21, 1850.

Our Foreign Bulbs have arrived in fine condition.

Seed and Horticultural Establishment, Sudbury, Suffolk.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WM. WOOD AND SON having with much care made a choice Selection of the best CINERARIAS from those sent out during the last two seasons, and having a fine stock of healthy plants, that will bloom well during the ensuing winter and spring, beg to offer them on the following terms, viz.:

12 very superb new varieties	18*s.* 0*d.*
24 ditto ditto	30 0
12 new Fuchsias of 1850	18 0
12 new Verbenas of 1850	15 0
24 ditto ditto	25 0
12 new Petunias of 1850	18 0
Superior mixed double Hollyhocks, per dozen	6 0
Superb named ditto, per dozen	18 0

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse, and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s* 6*d.* each; or smaller ditto, 1*s* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET-WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

CHOICE SEEDLING CALCEOLARIAS AND CINERARIAS.

JOHN HENCHMAN begs to state that he has a few hundreds of choice seedlings to spare, from the stock raised for his own growth, at 2*l.* per 100. The seed was saved with great care from choice varieties, and the plants are free and healthy. The Cinerarias will commence blooming in February and March, and the Calceolarias in April and May, and will continue to bloom all the summer. Orders amounting to 2*l.* sent carriage free to any part of England. A few packets of Calceolaria seed at 1*s.* and 2*s.* 6*d.* each. A remittance requested from unknown correspondents.

Edmonton, near London.

SPLENDID NEW GERANIUM—"THE VILLAGE MAID."

HENRY WALTON, FLORIST, &c., Edgend, Marsden, near Burnley, Lancashire, begs to offer to his kind patrons and the public in general his splendid light SEEDLING GERANIUM, "THE VILLAGE MAID," of which the following description was given in the Gardeners and Farmers' Journal, July 13, 1850: "Your seedling is a noble flower; form good; upper petals purplish crimson, shading to bright rose, veined with black, beautifully margined with white; the lower petals well shaped, of the purest white, almost resembling frosted silver, their exquisite consistency inducing this magnificent appearance. We are averse to eulogising a Pelargonium on the inspection of a single pip, but the universal beauty of yours has induced the exception." Opinion of Mr. Whomes, Windsor Nursery: "Lower petals stout and decided good white, with great breadth; the upper petals finely formed and well covered; a decided beat on Arnold's Virgin Queen." Opinion of Mr. E. Tiley, Nurseryman, Pulteney Bridge, Bath: "I have received your Geranium blooms, which I have shown to two or three Geranium growers, and they were of the same opinion as myself—that it is one of the best shaped flowers yet grown, and very distinctly marked."

H. W. can with confidence recommend the above as a fine trusser and good habit. Strong plants, well established, 1*l.* 1*s.* The usual allowance to the Trade, and one over when three are taken.

H. W. also begs to inform his numerous patrons in general that his Autumn Catalogue of Geraniums, Fuchsias, Cinerarias, Hollyhocks, &c. &c., is now ready, and may be had on application, inclosing one stamp.

ROSE CATALOGUE.

H. LANE AND SON, Great Berkhamstead, Herts, will send their New CATALOGUE to all their old customers free, and new applicants may have it by enclosing two penny stamps. Those who are about planting Pleasure Grounds, &c., should inspect H. L. and Son's Nurseries (about 50 acres), as they have a fine healthy stock of some thousands of Cedrus Deodara, 2 to 4 feet; Araucarias, 2 to 3 feet; Abies Douglasi, from seed, 4 to 5 feet; with all the leading Pinus. Rhododendrons, all the hardy varieties from white to crimson, growing in loam, from which they remove readily; also the hybrids of Sinensis, greenhouse varieties; Azaleas, best Ghent; with a general collection of Trees and Shrubs, both for the Pleasure Ground and Park; also of Fruits, Catalogues of which may be obtained by enclosing two penny stamps. The stock of Plants at these Nurseries is kept constantly removed, to ensure success, and not drawn up to be sold at a price to deceive the public. Double Camellias, and Greenhouse Azaleas, 1 to 4 feet—prices given on application.

CAMELLIAS, CHRYSANTHEMUMS, &c.

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, are now sending out fine young Plants, with flower-buds, of all the leading sorts of CAMELLIAS, at 30*s.* per dozen, package included; also good Plants for flowering this autumn of the best and newest varieties of CHRYSANTHEMUMS, at 12*s.* per dozen, package included.

CHANDLER and SONS have also to offer a fine stock of large Plants of China Arbor-vitæ, Hollies, common Laurel, Box, Scarlet Arbutus, &c., at very moderate prices.

DUTCH BULBS, EARLY FLOWERS FOR THE WINTER AND SPRING ADAPTED FOR BLOOMING IN-DOORS AND IN THE BORDERS. — The undersigned having received their annual importation of DUTCH BULBS from Haarlem, offer the following choice collection for 10*s.*, viz.: Half-dozen first-rate Hyacinths for glasses, Half-dozen good Hyacinths for pots, 50 Crocuses, four separate colours; 50 Double Snowdrops, Half-dozen Double Van Thol Tulips, Half-dozen Early Van Thol Tulips, 1 dozen Double White Sweet-scented Narcissus, Half-dozen Double Jonquils, 1 dozen Winter Aconites, 25 splendid Mixed Tulips, and 1 dozen best Mixed Double Anemones.—CLARKE and COMPANY, Seedsmen and Florists, 86, High-street, opposite the Town-hall, Borough, London.

GERANIUMS.

JOHN CATTELL has now ready to send out fine healthy plants of the following new and splendid sorts, at the prices annexed: Prince of Orange, 10*s.* 6*d.*; Nandee, 7*s.* 6*d.*; Nonesuch, 10*s.* 6*d.*; Christabel, 7*s.* 6*d.*; Lord Gough, 5*s.*; Lord Stanley, 5*s.*; Crispina 5*s.*; Satisfaction, 5*s.*; the set of eight, including package, 40*s.* The above are Hoyle's set of eight, as sent out in November 1849, at 21*s.* and 31*s.* 6*d.* each. Twelve of the following very superior sorts, mostly new ones in 1848, purchaser's selection, package included, for 24*s.* (Those with F are fancy varieties): Salamander, Oriflame, Rosamond, Abd-el-Kader, Brilliant, Virgin Queen, Windsor Castle, Crusader, Flamingo, Mont Blanc No. 2, Forget-me-Not, Alboni (F), Hero of Surrey (F), Jenny Lind (F), Odorata magnifica F). Every sort of the above ought to be in the most unique collection.

The best and most distinct of the older kinds, both Fancy and Florist varieties, 12*s.* per doz. Seedled sorts, in 12 varieties, 8*s.*; Flower of the Day, strong, 10*s.* 6*d.* each.

DUTCH AND OTHER BULBS.

J. C. begs to observe that his collection of the above have arrived in fine condition, a priced Catalogue of which is now ready, and may be had on application by enclosing a penny stamp. He would particularly call attention to his very splendid Seedling Lilium speciosum or lancifolium, eight varieties of which are entered in his Catalogue, worth adding to every collection, as they come into flower a fortnight before punctatum, and vary in colour from punctatum to deeper than Speciosum rubrum. Also to his fine collection of Amaryllis, &c. A remittance or reference from unknown correspondents.

Westerham, Kent, Sept. 28.

BURMAN'S "MRS. BURMAN," PINK, warranted one of the most perfect ever offered, 5*l.* per pair.

LIGHTBODY'S "LORD JEFFERY," PANSY, has been much admired, comes in fine character throughout the season, and has been awarded a certificate of "first class."—Per plant, 5*s.*

Strong healthy plants of the above superb flowers are now ready. Large collections of the finest show varieties of Tulips, Auriculas, Pinks, Pansies, Carnations, &c. The roots of his seedling Ranunculus (which surpass all other varieties) are this season unusually fine. Catalogues may be had by enclosing a postage stamp.—GEORGE LIGHTBODY, Falkirk, N.B.

TO NURSERYMEN, FLORISTS, &c.

J. LINDEN, late of Luxembourg, begs respectfully to inform the above that he has removed his Establishment to 74, Chaussée d'Haecht, Faubourg de Schaerbeck, Bruxelles; and also to state that his fine collection of ORCHIDACEOUS PLANTS has been enriched by many recent novelties, which he offers at moderate rates.

Orders received through his London Agents, BETHAM and BLACKITH, Custom-house and General forwarding Agents, Cox and Hammond's Quays, Lower Thames-street, London.

COCHIN CHINA FOWLS.—A few well bred Birds of this season for sale. For particulars.—Apply to Messrs. JESSOP BROTHERS, Nursery Gardens, Cheltenham.

H. GROOM begs to say that his CATALOGUE is ready, and will be forwarded by post on application.

NEW CAMELLIAS, &c.

YOUELL AND CO., possessing an extensive Stock of all the new and very best varieties of the above, in beautiful healthy plants, well furnished with flower-buds, beg to offer them at 30*s.* per dozen, package included. Catalogues can be had on application.

YOUELL and CO. also beg to call attention to the following:

ERICAS, of the best autumn, winter, and spring-flowering kinds, 6*s.* to 9*s.* per dozen

EPACRIS, ditto ditto, 9*s.* to 12*s.* per dozen.

APHELEXIS humilis, macrantha purpurea, speciosum, superbum, and other fine sorts, 9*s.* per dozen.

STATICE MACROPHYLLA, a beautiful Conservatory or Greenhouse Plant, 3*s* 6*d* each.

MITRARIA COCCINEA, a splendid hardy shrub, with large scarlet flowers, fine bushy plants, 18*s.* per dozen.

FUCHSIAS, all the new and best varieties of 1850, 18*s.* per dozen.

VERBENAS, ditto ditto, 1850. 12*s.* per dozen.

CORRÆA speciosa major, Cooperii, bicolor, &c., in fine bushy plants, for winter flowering, 12*s.* per dozen.

PINKS, all the finest first-class show varieties, comprising such as have been exhibited in all the winning stands at the past metropolitan exhibitions, 12*s.* and 18*s.* per dozen pairs, and can be sent post free (September the best month for planting).

HYACINTHS, a superb collection of all the best kinds, known, for glasses or pot culture, at 9*s.*, 12*s.*, and 18*s.* per doz.

Catalogues can be had on application. Strong plants of their new Chrysanthemums for autumn flowering may still be had, for particulars of which see their Advertisement of Aug. 31. They also continue sending out packets of their fine Anemone Seed.—Royal Nursery, Great Yarmouth, Sept. 28.

ROSES.—The Descriptive CATALOGUE of ROSES, 20th Edition, for the present autumn, by THOMAS RIVERS, is now ready for delivery; it will be sent as usual, gratis, to all known correspondents. Applications enclosing two postage stamps will also be promptly attended to. The above edition, entirely re-written and arranged, contains only the most select Roses, both old and new, so that the purchaser will not be confused by a lengthened list of mere nominal varieties.
Sawbridgeworth, Herts.

SEED POTATOES FOR AUTUMN PLANTING.—FOR SALE, a few Tons of TAYLOR'S FORTY-FOLD, a choice round Potato, almost as early as the Ashleaf, equal in keeping and table qualities to the best York Regents, a good cropper, and proved to resist the disease better than any other variety, escaping in some neighbourhoods in the midst of infection. Price of picked middle size (or large size) for seed, 7*s.* per cwt., or 6*l.* 10*s.* per ton. Small seed 5*l.* 10*s.* for cash.—Apply to Mr. W. J. KNIGHT, General Agent, Bridgewater, Somerset.

NEW ROSE CATALOGUE.

WM. WOOD AND SON have the pleasure of announcing that their DESCRIPTIVE CATALOGUE for the ensuing season is now ready. In addition to the splendid collection enumerated in former Catalogues, the present edition contains many varieties of first-rate merit.
As heretofore, the Catalogue will be duly forwarded to all who have favoured W. W. and S. with their commands, and may be had Gratis on application; also Catalogues of Ornamental Trees and Shrubs, Coniferæ, American, Herbaceous, and Greenhouse Plants; and Descriptive Catalogues of New and Choice Fruit-trees, new Verbenas, Fuchsias, Cinerarias, &c. &c. The Trade Catalogue is also now ready.
Woodlands Nursery, Mar-sfield, Uckfield, Sussex.

DUTCH BULBS AND OTHER FLOWER ROOTS.

THOMAS JACKSON AND SON respectfully announce that they have received, in fine condition, their annual consignment of the above; and as they import none but those of the largest size and best quality, purchasers may rely upon having fine roots.
Good mixed double Hyacinths for Borders, 3*s.* 6*d.* per dozen.
Fine named double and single Hyacinths for Glasses or Pots, from 6*s.* per dozen.
The newest Crocuses, and all other Bulbs at the same moderate rate.

ROYAL GARDENS, HAMPTON COURT.

Having added by lease these famous Gardens to their previously extensive premises, "T. J. and Son" now possess the largest Glass Establishment in the Trade. To their General Stock, they respectfully invite the inspection of Noblemen, Gentlemen, and Purchasers, who will find in fine health and great quantity (in the Fruit Department), Fruiting and Succession Pines, Figs, Vines, Cherries, Strawberries, &c., in pots for forcing; (in the Flower Department), Orchidaceous, Stove, Greenhouse, and Herbaceous Plants; (and in the open Ground), Fruit, Ornamental, and Forest Trees, Shrubs, Roots, and General Nursery Stock on Sale at the lowest remunerative prices.—Nursery and Seedsmen, Kingston, Surrey, Sept. 28.

MESSRS. STANDISH AND NOBLE have to offer the following very desirable plants as under; at the same time they beg to observe that they supply every kind of Nursery Stock, Catalogues of which can be had on application.
AZALEA INDICA, "GLORY OF SUNNING-HILL."—In general appearance this plant, when in bloom, reminds one of Nerium splendens, producing large double rose-like flowers of the richest pink; good plants, 3*s.* 6*d.* to 10*s.* 6*d.* each.
CRYPTOMERIA JAPONICA SEEDLINGS.

1 year	12*s.* per doz., or 63*s.*	per 100.
2 years	18*s.* ,,	105*s.* ,,
3 years	30*s.* ,,	210*s.* ,,

1 foot 6 inches to 2 feet 6 inches high, 60*s.* per dozen.
2 feet 6 inches to 3 feet 6 inches high, 90*s.* ,,
3 feet 6 inches to 4 feet 6 inches high, 126*s.* ,,
And larger plants in proportion.
The whole of the above, with the exception of the one and two years seedlings, were planted into the open border last spring, are fine robust specimens, and fit for immediate planting.
CRYPTOMERIA JAPONICA var. NANA, a very singular dwarf variety, 10*s* 6*d.* to 21*s.*
CUPRESSUS FUNEBRIS, or WEEPING CYPRESS. (North of China.)
6 inches high, 10*s.* 6*d.* each; 12 to 15 inches, 20*s.* each.
These plants are from the open border—robust specimens fit for immediate planting.
15 ins. to 24 ins., 31*s.* 6*d.* each; 24 ins. to 30 ins., 42*s.* each.
CUPRESSUS GOVENIANA. (California.)
6 to 9 inches, 7*s.* 6*d.* each; 9 to 15 inches, 10*s.* 6*d.* each.
15 to 24 inches, 20*s.* each; 2 to 3 feet, 31*s.* 6*d.*
CUPRESSUS LAMBERTIANA, 2 feet, 3*s.* 6*d.* each.
CUPRESSUS THURIFERA, var. ELEGANS, perfectly hardy.
1 foot to 2 feet high, 3*s.* 6*d.* to 5*s.* each.
CEPHALOTAXUS FORTUNII, strong plants, 31*s.* 6*d.* each.
For description, see "Botanical Magazine," by Sir W. Hooker.
FORSYTHIA VIRIDISSIMA.
1 foot 6 inches to 2 feet ... ... 1*s.* 6*d.* to 2*s.* 0*d.* each.
2 feet to 3 feet ... ... ,, 2*s.* 6*d.* ,,
3 feet to 4 feet ... ... 3*s.* 6*d.* ,, 5*s.* 0*d.* ,,
Fine bushy plants from open border fit for immediate planting.
JASMINUM NUDIFLORUM ... ... 1*s.* 0*d.* each.
Flowering plants ... ... 3*s.* 6*d.* ,,
This is a very desirable winter flowering hardy plant, producing a profusion of flowers of the richest yellow from December to February.
QUERCUS SCLEROPHYLLA. (North of China.) This is undoubtedly the most remarkable of all evergreen Oaks, having foliage as large as the Spanish Chestnut, and more than twice the substance. Strong seedling plants 42*s.* each.
QUERCUS INVERSA. (North of China.) Also evergreen, with smooth entire leaves, having remarkably large male inflorescence. Seedlings, 42*s.*
TAXODIUM SEMPERVIRENS.
1 foot to 1 foot 6 inches ... ... 2*s.* to 2*s.* 6*d.* each.
1 foot 6 inches to 2 feet 6 inches ... 3*s.* 6*d.* to 5*s.* ,,
3 to 4 feet ... ... 7*s.* 6*d.* to 10*s.* 6*d.* ,,
Larger in proportion.
VIBURNUM PLICATUM. (North of China.) A noble shrub, producing in great profusion large globular heads of flowers of the purest white. Strong plants, 21*s.* each.
WEIGELIA ROSEA.
6 inches high ... ... 1*s.* 0*d.* each.
1 foot to 1 foot 6 inches ... ... 1*s.* 6*d.* to 2*s.* 6*d.* each
1 foot 6 inches to 2 feet ... ... 3*s.* 6*d.* to 5*s.* 0*d.* ,,
These last are fine bushy flowering plants.
Selections of the finest Autumnal Flowering Roses.
Standards ... ... 15*s.* 0*d.* per dozen.
Half Standards ... ... 12*s.* 0*d.* ,,
N.B.—Messrs. STANDISH and NOBLE have a large quantity of very fine common Laurels, from 2 feet to 6 feet high; also Spruce Fir, from 2 feet to 4 feet high; which can be sold very cheap, particulars of which can be had on application.
Bagshot Nursery, Sept. 28.

TO GARDENERS, &c.

GUTTA PERCHA TUBING for Watering Gardens, spreading Liquid Manure, &c., may be had joined up to any length. Waterproof Soles for Boots and Shoes. Thread for tying up Plants. Gutta Percha Canvas suitable for nailing up Trees, &c.—Manufactured by THE GUTTA PERCHA COMPANY PATENTEES, 18, Wharf-road, City-road, London.

HYACINTHS AND OTHER ROOTS.

RENDLE'S NEW PRICED CATALOGUE OF BULBOUS ROOTS

Is just published, and can be had on application, gratis. It contains a DESCRIPTIVE *List of all the best Hyacinths, Tulips, Iris, Ranunculus, Anemones, Crocus, Liliums, Gladiolus, Ixia, &c., with some excellent* CULTURAL ADVICE *as to the best method of growing them. It will be found of great service to all growers.*
The "Collections of Seeds" sent out by us having given such universal satisfaction, we have been induced to offer the following "Collections of Roots," which we are certain will please every purchaser.
For the List of Roots contained in the Collections, see our new Book Catalogue.

COLLECTIONS OF BULBS.	£	*s.*	*d.*
No. 1 Collection, all the most approved sorts ...	3	0	0
No. 2 Collection, containing smaller quantities ...	2	0	0
No. 3 Collection, for a small Garden	1	0	0

For details of Collections, see Catalogue.

100 Hyacinths in 100 very fine sorts. Purchaser's selection	3	0	0
100 Hyacinths in 50 fine sorts. Purchaser's selection	2	10	0
50 Hyacinths in 50 superior sorts ditto ...	1	10	0
50 Hyacinths in 25 superior sorts ditto ...	1	5	0
24 Hyacinths in 12 superior varieties ditto ...	0	12	0
12 Hyacinths in 12 superior varieties ditto ...	0	6	0

Where the selection of Hyacinths is left to W. E. R. and Co., they request to be informed whether they are intended for water, pots, or the open ground; also whether single or double Hyacinths are preferred. When the choice is left to them they generally send about two-thirds double, and one-third single, which gives a greater variety. Purchasers may rely upon really good sorts being selected when the choice is left to ourselves, and we will guarantee to give them satisfaction.
For Catalogues, and further information, apply to
WILLIAM E. RENDLE AND Co.,
Seed Merchants, Plymouth.
N.B. Our Hyacinths and other roots have just arrived from Holland in excellent condition.

FERGUSON'S SUMMER AND WINTER BEDDING-OUT PLANTS.—Ladies and Gentlemen, if you want choice for the summer you will find it advantageous to order now for May, 1851. I have room to winter almost an unlimited number; and where the reference is respectable, and a doubt of their genuine quality, I will not wish a remittance till they prove worthy.
I also offer, at double the price, the following, in about equal quantities, for filling the beds in winter, and which can be removed to a reserved place before planting the Verbenas, &c., in May, and returned again and again, without injury. Nice plants of Aucuba japonica, Chinese Arbor-vitæs, Junipers, Green Holly, Laurestinus, Tree Box, Common and Portugal Laurel, Cotoneaster microphylla, Yew, Berberis aquifolium, &c.
For larger stuff, see other advertisements. As the rail is completed to Aylesbury and Buckingham, D. F. invites inspection. For specimen plants, the former; small, the latter.
DAVID FERGUSON, Nurseryman, &c., near Buckingham.

KITLEY'S "GOLIAH" STRAWBERRY.

ROBERT WHIBLEY is supplying fine plants at a very reduced price, for cash, viz., 2*s.* per dozen, or 10*s.* per 100. Also select Chrysanthemums, in great variety; blooming plants in 5-inch pots, from 6*s.* per dozen. Lists can be had.

SELECTED NEW SCARLET GERANIUMS.

The following superb sorts will be ready on and after the 21st of October: Flower of the Day, 10*s.* 6*d.* each; Phenomenon, Tom Thumb's Master, Gem of Scarlets, Tom Thumb Improved, Symmetry, Pink Pet, Cerise Unique, Punch, Hydrangæflora, Queen of Summer, Magnum Bonum, Perpetual, Lady Agnes Byng, Jenny Lind, Cottage Maid, Trentham Scarlet, 12*s.* per dozen, or 11 and Flower of the Day for 20*s.* Orders selected in the rotation received.
Chester Nursery, Kennington, London.

NEW HYACINTH SUPPORT.—HOOPER AND CO., CENTRE AVENUE, COVENT GARDEN MARKET, invite the attention of the Flower-growing Public to their new and perfect
SUPPORT FOR HYACINTHS IN GLASSES.
Its excellence consists in its being neat in appearance, easily applied, keeping the bloom erect almost without being visible, and suited to every size and shape of Hyacinth Glass.
May be obtained of the principal Seedsmen and Florists.

TREES, SHRUBS, ROSES, VERBENAS, &c., FOR THE MILLION.

DAVID FERGUSON, LANDSCAPE GARDENER, CONTRACTOR, PLANTER, &c., offers common Laurels at 1*l.* to 5*l.* per 1000; if 100,000 are taken 10,000 will be added. Good standard Roses, 3 to 6 feet, 5*l.* per 100, and 40*l.* per 1000. Berberis aquifolium, fine, 1*l.* to 3*l.* per 1000. Evergreen Privet, strong, 1*l.* to 1*l.* 5*s.* per 1000. Cotoneaster microphylla, for hedges, &c., fine, 10*s.* per 100, and 4*l.* per 1000. Also large quantities of the following at low prices:—Fine specimen Cedrus Deodara and Pinus excelsa, 4 to 6 feet in height, in pots; fine specimen Arbor-vitæ, Aucuba japonica, Yews, Box, Phillyreas, red Cedars, Araucarias; Scotch, Silver, and Spruce Firs; Larch, Oak, Elm, Ash, Lime, Hornbeam, Hazel, double pink and scarlet Thorns, fine maiden Peaches and Nectarines, worked from trees in the houses on the spot; some of the fruit was exhibited at Regent-street, and received a Banksian Medal, though very inferior to what D. F. has sent to his fruiterer at different times this season, which can be proved; with large quantities of other Fruit Trees. Also first-rate Verbenas, Petunias, Calceolarias, Geraniums, Fuchsias, Anagallis, Salvias, Cupheas, &c., for bedding out, at 1*s.* 6*d.* per dozen, if 5 to 20 dozen are taken; 1*s.* 3*d.* if 20 to 50 dozen are taken; above 50 dozen, 1*d.* each; and if 100 dozen are taken, 5 dozen will be added. Carriage free to London, Birmingham, Leamington, Peterborough, Banbury, Bedford, and all intermediate stations on the North-Western Railway.
Lists marked for selection at the above prices sent free on application; but to those not already in possession of a collection, D. F. advises parties to state the colour and quantity they want, and leave the selection to him; and to those that have no convenience for wintering plants, they will find it advantageous to give their annual orders in August and September for the following spring, as they, on taking five dozen and upwards, will have the choice not only of those marked in the list, but any other bedding out plant, if possible to procure, at equally low prices.
Letters directed Buckingham (where all Post-office orders are requested to be made payable), in place of Aylesbury, reach D. F. one day sooner.

FOR SALE, a new and valuable invention for HATCHING GAME AND POULTRY at all seasons of the year. The apparatus has been thoroughly tested, is perfectly portable, and capable of hatching twice the number of eggs at one-fourth of the cost of any incubator hitherto introduced to the public. A person of energy and capital might realise a large income by effecting a purchase of the invention, and taking out a patent; or a respectable party would be treated with to take a share in the undertaking.—Address, R. S. T., Mr. Newman's, Goat-lane, Norwich.

A LIST OF TERRESTRIAL AND EPIPHYTICAL ORCHIDEÆ,
FOUND IN ASSAM AND THE NEIGHBOURING HILLS.
[Unless specifically mentioned, the Plants are Epiphytes, and from the Hills.]
Apply to Messrs. CHARLES CANTOR AND CO., in Calcutta, who will receive orders for Orchideæ of Assam and the Hills in the vicinity.

N.B. Plants not marked are common. Plants marked with an *a*, are found less frequently, and are consequently considered as somewhat rare. Plants marked with a *b* are seldom brought in, and consequently are considered very rare.
Fifty rupees for a box measuring 3 cubic feet, containing 40 to 50 plants of the larger kinds, or 50 to 80 of the middle and smaller kinds. One rupee for a single plant of the common kinds. The rare and very rare in proportion. If any new plants, not discovered before, are sent, a separate charge will be made.
A plant is generally composed of a bunch containing 5 to 10 stems, or more. Those with pseudo-bulbs, 10 to 20 or more; and Aerides, Vanda, Saccolabium and Orchideæ of similar growth, 2 or 3 together.

IMPORTANT TO GENTLEMEN, FARMERS, AND GARDENERS.

TO BE DISPOSED OF, the produce of Two Acres of POTATOES, from Mr. Sangster's prepared cuttings, on Mr. Wm. Weller's Farm, near the Falstaff Inn, on the road from Gravesend to Chatham, on the 14th Oct., and the three following days, while they are being taken up. They are free from disease, and first-rate quality. Those who may not be able to attend, will please to forward their orders early (as the stock is small), to Messrs. HAY, SANGSTER, and Co., Nurserymen and Seedsmen, Newington Butts, London, with Post-office orders, payable to JOHN SANGSTER, Borough, which will meet due attention.

PRICE ON THE GROUND.

York Regents	8*s.* per bushel,	21*s.* per sack of 3 bushels.	
American Natives	8*s.* do.	21*s.* do.	do.
Soden's Early Oxford	10*s.* do.	27*s.* do.	do.

Delivered at Rochester, or the Railway Station, at 1*s.* per bushel extra, including bag and sack.
Newington Butts, London, Sept. 28.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patants.—This cooking apparatus possesses greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus. B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. May be seen in daily use at the Craven Hotel, Craven-street, Strand; Stevens' Hotel, Bond-street; Greenwich Hospital; University College Hospital; and is in use by upwards of 200 private families, and at the Manufactory, 130, Fleet-street, London. A prospectus can be forwarded upon application, detailing particulars and price.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s.* per 100.

Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s.* 6*d.* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 20*s.* per 100.—Manor Farm, Deptford.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

GEORGE JACKMAN, NURSERYMAN, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

E. FOSTER, ESQ.'S, NEW PELARGONIUMS.

WM. DRAGG is authorised by EDMUND FOSTER, Esq., of Clewer Manor, to send out his new and choice varieties for 1850, Catalogues of which can be had on application. The Rev. Mr. ROUSE has likewise favoured W. B. with the stock of his superb Pelargonium "ALIBI." Other good and approved sorts; for description and price, see Catalogue, which contains lists of Chater's and other new and superb Hollyhocks, Pansies, Pinks, Picotees, Carnations, Roses, Chrysanthemums, &c.; ground and pot roots of show and fancy Dahlias.—Ste- Nursery, Slough, Bucks.

FIRST CLASS SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER.—For a description of this valuable flower, see the *Gardeners' Chronicle* of Saturday, Sept. 7. It is a sterling flower, and will be sure to give the greatest satisfaction. Price 20*s.* each. One over on every three to the trade.

Apply to WILLIAM E. RENDLE and Co.,
Nurserymen, Plymouth.

NEW AND CHOICE GERANIUMS,
AT VERY LOW PRICES.
PLANTS WILL BE READY ABOUT THE MIDDLE OF OCTOBER.

WILLIAM E. RENDLE AND Co., Plymouth, have this season a very large stock of the following GERANIUMS, and are enabled to offer them at the
FOLLOWING LOW PRICES.

Purchaser's Selection of Twelve from the following List for Forty Shillings; or without the first three for Thirty Shillings.

FOQUETT'S MAGNIFICENT, FOSTER'S GIPSY BRIDE, FALSTAFF,

Star, Ariel, Blanche, Negress, Cracker, Cassandra, Sundown, Symmetry, Gustavus, Gulielma, Grandiflora, Foster's Victory, Clown, Singularity, Refulgens, Cruenta, Princess, Junii, Rosamond, Harlequin, Emilie, Centurion, and Brilliant.

SCARLETS.—Commander in Chief, Excellence, and Queen of Summer.

FANCY GERANIUMS.

Purchaser's Selection of Twelve from the following List for Twenty-five shillings, or Twenty for Thirty-five shillings.

Alboni (Henderson's), Anais, Bouquet tout fait, Beauty of Winchester, Champion of Devon, Fair Emily, Fairy Queen, Jehu, Jehu improved, Ibrahim Pacha, Jenny Lind, Lady Rivers, Lemon-scented, La belle Africaine, Lady Plymouth, Lady Scarborough, Madame Grisi, Mazeppa, Superb, Madame Celeste, Minerva, Modesta, Magnifica, Nosegay, Pheasant's foot, Prince of Orange, Picturata, Queen Victoria, Quercifolium coccineum, Radula, Rosa odorata, Sidonia, Statiaskii, Unique, and Zelia.

Purchaser's Selection of Twenty from the following List for Twenty shillings.

ARNOLD'S VIRGIN QUEEN (the best white known), Star of the West, Jenny Lind, Hoyle's Crusader, Orion, Marc Antony, Mary Queen of Scots, Rosy Circle, Nourmahal, Margaret, Mount Etna, Desdemona, Hebe's Lip, Aurora, Pluto, Champion, Pearl, Forget-me-not, Sunrise, Isabella, Duke of Cornwall, Conflagration, Black Prince, Mercury, Lady Ebrington, Scarlet Defiance, Rosa Mundi, Distinctus, Admiration, Mustee, and Flora's Flag.

Descriptions of most of the above-named Geraniums will be found in our NEW BOOK CATALOGUE OF PLANTS, which can be had on application for one penny postage stamp.

*** FIRST ORDER WILL SECURE BEST SELECTION.

All Orders above 2l. will be delivered free of carriage to any station on the Great Western, Bristol and Exeter, and South Devon Railways.

Railway and Steam communication from this port to all parts of Great Britian and Ireland.

WILLIAM E. RENDLE AND CO.,
NURSERYMEN, PLYMOUTH.

THE BLACK PRINCE STRAWBERRY, now sending out at 10*s.* per 100.

Also PRACTICAL INSTRUCTIONS FOR THE CULTIVATION OF THE POTATO, containing a Competition Essay for the Prize of 1000 francs offered by the Belgian Government. Also Instructions on the Management of Asparagus, Seakale, Rhubarb, Vegetable Marrow, Scarlet Runner, Strawberry, Melon, and Cucumber; Chicory and Lamb Lettuce as Salads; the Lisianthus Russellianus, and the Tree Mignonette. The Destruction of Woodlice and Green-fly; and Peat Charcoal as a Manure. By JAMES CUTHILL, Horticulturist, Camberwell, London.—Printed for the Author, and sold by him only. Price 2*s.*; or, by post, 2*s.* 4*d.*

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, engages to supply the Public with the NATURAL GRASSES AND TREFOILS, in mixtures suited to the description of soil which may be named, at 1*l* per acre, allowing 3 bushels. The Seeds to be delivered on the railway. Mixtures for Lawns and old Pastures at an equal reduction. These Seeds are gathered by a gentleman, who, having made them his study from boyhood, now offers the result of his labour for the good of the landed interest, who are so suddenly and un qually taxed.

A reference is required from unknown correspondents.

NURSERIES, CHESHUNT, HERTS.

A. PAUL AND SON respectfully inform their Customers and the Public in general, that their New and Descriptive CATALOGUES of Roses and Hardy Ornamental Flowering Trees and Shrubs will be ready by the 1st of October. Applications, enclosing two stamps for the Rose, and one for the Tree Catalogue, will be immediately attended to.

SAFFRON WALDEN.
SUPERB "DOUBLE HOLLYHOCKS."

WILLIAM CHATER begs respectfully to inform the public, that he is now sending out Plants of his unequalled collection of this ornamental flower. See Catalogue, which may be had on application, by enclosing a postage stamp. Hints on their cultivation given to purchasers, if required.

Saffron Walden, Essex, Sept. 28.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 28, 1850.

MEETING FOR THE ENSUING WEEK.
TUESDAY, October 1—Horticultural .....3 P.M.

IN these days, when quacks endeavour to cram their nostrums down simple people's throats, and persuade JOHN BULL that their conundrums are the only things under heaven by which a gardener may hope to prosper, there is some danger that the real principles of horticulture may be lost sight of, and that the simple rules of science and good sense may be abandoned, for a foolish belief in the potency of tiles, and pipes, and pots, and pans, and other trumpery. It is therefore time to declare that good gardening wants no such aids; that the simplest means are those which, in skilful hands, lead to the best results, and that he is the best gardener who produces the greatest profit at the smallest cost.

When the great engineer, with some tackle and a few score labourers, lifted the vast tube of the Menai bridge, he did no more perhaps than a PHARAOH could have accomplished by the united force of 10,000 slaves. But, in the one case we had science, skill, and economy; in the other, brute force and barbarian profusion. Will anyone venture to place the despot on a level with the philosopher? In like manner when a gardener with a clear head, skill, and a glazed box, produces crops that are at the least equal to those obtained in costly hothouses with all the appliances of wealth and material, we must take care not to elevate the owner of the latter, even though he wear a smart coat, and clean linen, to a level with the former, ragged and poor as his apparel may be, and seldom as his wages go to the payment of a washer-woman. The first is the great gardener; the other is infinitely his inferior *as such*, even though he should have a handle to his name.

If any one wishes to apply these observations he will do well to read "CUTHILL'S Practical Instructions,"* for then he will find what simple means are needed to bring about the most perfect results in the branch of gardening to which they refer. We are too little in the habit of meeting with gardening advice to which no exception can be fairly taken, either theoretically or practically, not to draw attention particularly to this little book, in which the reader will find the results of a good cultivator's experience told without humbug and coxcombry. The author is a market-gardener; he gets his living out of a small piece of ground at Camberwell; his interest impels him in every way to observe the utmost possible economy consistent with profit; he therefore eschews all fiddle-faddle schemes for dandifying a kitchen garden; and he tells his readers honestly and fully what he does and how he does it. The goodness of his advice concerning the Potato is attested by the fact that he is not among the serious sufferers by disease.

As it is probable that no crop is worse grown or worse managed, as a whole, than Asparagus, we shall select some of Mr. CUTHILL'S remarks upon that root, in illustration of the foregoing observations. The following is his description of the London market garden method:—"The present plan of making Asparagus beds round London, consists in putting on *an immense quantity of manure*, and trenching the ground three or four feet deep, mixing the manure as the work proceeds. In March the ground is measured out after the following manner; suppose that a fence runs south and north, or otherwise, 3 feet is allowed between it and the first row; a drill is drawn about two inches deep, the seed sown thinly, say six inches or a foot apart, that gives choice of drawing out the weakest, in order that the permanent crop may stand one foot apart. The next row is sown 18 inches from the one just mentioned; then for the alley and two sides of the bed, 5 feet are allowed; then another row of seeds, and so on, that gives two rows to each bed. The first year Onions are generally sowed all over the ground; the second year, Lettuce, or any dwarf-growing vegetable that will not choke the Asparagus, and so on; until the third year, when the beds are formed out, and a few inches of mould dug out of the alley, and put on the crowns; but only a few of the finest heads are cut this year. Autumn arrives, and when the haulm is cut, the whole of the ground is forked over, and planted with Cabbage, Coleworts, or winter greens; then in spring the beds are largely supplied with mould out of the alleys, covering the crowns from 8 to 10 inches deep. The finishing of the cutting must be left to the grower. A fair crop of heads must be left after four or five weeks' cutting, in order, in some measure, to strengthen the young buds for the next year's crop, and to restore to the roots what has been taken from them, in the shape of a crop; but *not one head must be allowed to grow until you leave off cutting entirely* at the end of the fourth year (?) When the haulm gets ripe, it is all cut down, and the mould thrown into the alleys, and there enriched, and the whole of the beds and alleys are planted again with Cauliflowers, &c."

By this method the ground is economised with much skill, no doubt, and never allowed to be at rest; but the practice is in this defective, that the beds are dry when they should be moist, and that the Asparagus has to force its way upwards through a solid mass of resisting matter, which hardens the shoots by the resistance it offers to their progress, and renders them tasteless, by depriving them of light, except at the tip, which the Londoner nibbles with so much satisfaction. Mr. CUTHILL'S plan is this:

"I propose that each row be planted 3 feet distant from the other, and that each plant stand 1 foot apart in the row. This will give ample room for cleaning the crop, and for drawing up earth over the crowns, *so as to form a ridge 3 or 4 inches deep*, to be lowered again for the purpose of enriching the soil in the autumn and winter. By this method I consider that Asparagus might be cut *at least ten days earlier than it is* by the plan now practised of burying the roots deep in a bed of earth, where sun and air cannot act upon them; and, as for flavour, it has long been proved that, although gentlemen's gardeners do not grow Asparagus so large as the market-gardener, of the two, it is by far the *finest in flavour*, with *at least three times more eatable* matter in each head, though only two-thirds the length. I have had Asparagus sent to me from Brussels, all blanched together a beautiful creamy white, but, when cooked, I could not discover the taste of Asparagus in it. It was watery and insipid, as highly blanched Asparagus must always be, having only the watery flavour of the roots. I have proved this years ago, by keeping it in frames shut up, and the glass covered over with mats to exclude light."

—"As soon as the dead haulm is cut down in autumn, I give the beds a good rich dressing of rich manure for the winter, salting them in spring, and covering the manure with mould, to prevent evaporation. The rain carries down the strength of the winter covering to the roots; and, when spring arrives, it might be raked off into the alleys, leaving only mould enough on the beds to protect the roots from the summer sun. We have then Asparagus, green, and eatable almost to the very root."

In the preceding quotations the italics are our own. It will probably be urged that this advice is nothing new. We believe that to be so. But what the reader of gardening works wants is not novelty, but instructions as to how he is to find his way through the farrago of interested and disinterested recommendations by which he is surrounded. It is of no consequence to 9 men in 10 how many ways there may be of doing a thing; what they want to know is the best way; or, if there is some difference of opinion as to that, which way is certainly an excellent one. How seldom they are told this by persons they can trust, their own experience will show them. It is as a most useful help, as far as it goes, to those who most require help, that we have given this prominent place to a notice of "CUTHILL'S Practical Instructions."

THE KALOSANTHES COCCINEA and varieties, as bedding plants, cannot be excelled either in beauty or the facility with which their cuttings are struck and brought into a flowering state. The immense and singularly compact head of bloom that can be obtained from each comparatively small plant, in about nine months from the time the cuttings are put in, combined with their rich colour, render them the most attractive plants in the parterre.

We will proceed at once to give our mode of cultivating the family for bedding purposes, knowing, from the numerous inquiries made about our mode of treatment, that many of our readers will appreciate any information on the subject; and those who have only seen these plants cultivated in pots, for exhibition, will, we are sure, be gratified to learn

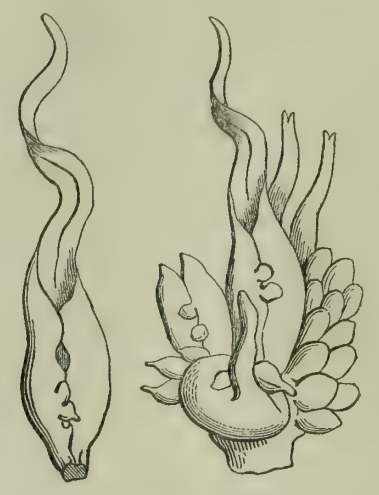
* "Practical Instructions for the Cultivation of the Potato," containing a Competition Essay for the Prize of 1000 francs offered by the Belgian Government. Also instructions on the management of Asparagus, Seakale, Rhubarb, Vegetable Marrow, Scarlet Runner, Strawberry, Melon, Cucumber; the Tomato, or Love-apple; Chicory and Lamb Lettuce as salads; the Lisianthus Russellianus; the tree Mignonette. The destruction of woodlice and green-fly; and peat charcoal as a manure By JAMES CUTHILL, Horticulturist, Camberwell.

that they are equally beautiful when planted out in beds; for, when well managed, their fine compact appearance and the size of the flower far surpass that of individual plants grown in pots. Any time about the end of September we take some strong points of the growing shoots, and after forming them into cuttings of 2½ inches in length, cutting close to a joint, and stripping the leaves from the bottom for about ¾ of an inch, we lay them on the potting bench to dry for 24 hours. This is necessary, as from the extreme succulence of the plants they are apt to rot if put in at once.

Shallow pans or boxes 4 inches deep, and any convenient length and width, are prepared by putting in 2 inches of drainage, then a little moss or sphagnum, and over that some lumpy peat or loam an inch deep; and then an inch of sandy loam, fine lime rubbish and sand, well mixed and pressed closely down.

The cuttings should be put in about an inch or 1½ inch apart, and a slight watering given to settle the soil round them. Place them in any frame or pit, or even in the greenhouse, close to the glass, and they will strike freely, and continue rooting all the winter. The tops will not grow much if kept near the glass, and plenty of air is allowed to circulate about them; nor is it desirable, as, the dwarfer the plants are, the more novel and beautiful they look.

In March prepare some compost for potting them, by mixing three parts sandy loam, some fine lime rubbish, a very little leaf soil, or lumpy peat and sand. Take the plants from the pans with little balls of soil, by raising them gently up with the potting-stick, and pot them singly in 4-inch pots well drained. Place them in a frame or pit, with their tops only 4 or 6 inches from the glass, and where the frost can be excluded; keeping the frame close for about a week or ten days; after which, they must be gradually inured to a circulation of air. Tilting the sashes at the sides, by placing the tilter between them and the rafter, will be found to answer better than sliding, or only tilting at the back. The object is to give strength, without drawing the plants up, and by keeping the glass close to their tops, to cause them to set flower-buds, which they will readily do under such treatment; and by planting out time, which with us is about the beginning of June, every plant, if well managed, will have its head of bloom perfectly formed, and beginning to expand.



Kalosanthes look best planted in circular or oval beds, placing the tallest in the centre, and gradually descending to the edge; the last row should be placed in the ground a little deeper than the rest, and should slightly incline outwards, in order to give a rounded appearance. Any good border soil seems to suit them; but if poor, some fresh loam and leaf soil should be added. We always water the plants well before turning them out of the pots, and the bed also when necessary. Some green Moss laid upon the surface of the bed, gives it a neat appearance, and prevents evaporation.

It will be found that no plant which is so beautiful can be more easily managed; and when in flower, it always attracts more notice than anything else. *G. F.*

It is curious how the merest accident sometimes affords valuable facts, where attention is alive to profit by every opportunity of observation. A few days since, a child just five years old brought a green capsule of a Carnation which was surmounted by three unusually large stigmas, begging that it might be opened for her to see what it contained. Nothing uncommon was anticipated, but on dissection our interest was at once excited. Amongst a number of the ordinary nearly colourless ovules six or seven much larger green bodies appeared, each surmounted by a white subulate process. On further examination, these were found to be almost cartilaginous, with a strong suture on the outer side, and a very faint one behind, being evidently abortive ovaries terminated by a stigma longer than themselves. After some search another specimen was found in which the placenta was divided into three distinct parts, two of them connected with the stigmas by the usual cord and bearing normal ovules, the other having three more or less perfectly formed ovaries, the upper and lower of which alone were furnished with a stigma, though all bore towards their base imperfect ovules. The remaining ovules, which had not undergone complete transformation, were no longer amphitropal, but erect. There was in no case any central placenta, but it was confined to the margin thus communicating immediately with the stigma without any stigmatic cord.

The fact tends to confirm the notion that the ovules are really, like the ovaries, metamorphoses of the leaves; and to throw light upon the true nature of central placentæ, showing that the curious capsule of Cerastium figured in our volume for 1844 by Mr. Babington is not so decisive on the point as might at first be supposed. We do not, however, advert to the matter merely on account of its physiological interest, though such instances of transformation can scarcely be too frequently noticed in a publication which has quite as much in view the diffusion of information already existent, as the recording of new or interesting facts; but, to give another example, in addition indeed to thousands, of the wisdom of always being on the watch for the information, and we may add too the rational pleasure which lies scattered beneath our feet merely waiting for some one, as it were, to pick it up. So true is it that

> By a rich loving-kindness, redundantly kind,
> Thus pleasure is spread thro' the earth,
> In stray gifts to be claimed by whoever shall find.

2. 1.

1. General view of the placenta, magnified. Two of the divisions, of one of which the stigmatic tissue alone is visible, bear normal amphitropal ovules; the third division bears ovaries instead of ovules, or if ovules, they are orthotropal. It will be observed that the two upper ovaries show the suture, the lower one not; because they are arranged round a reduced axis, the corresponding stigmatic tissue being entirely wanting.
2. One of the ovaries more highly magnified, showing two or three ovules towards the base.

Since the foregoing remarks were written, other capsules have occurred, confined, however, to a single plant, which throw a little more light on the nature of the placenta. In these, as in the former case, we find it in the full-grown capsules divided into three distinct lobes, one or more of them bearing transformed ovules and entirely free above, the other nearly in the normal condition and showing clearly the prolongation of its tissue into the stigma. In an early stage of growth the transformed ovules were strongly pedicellate and deflected, exhibiting at the apex a slight trace of the suture. Sometimes a second rudimentary and perfectly sessile carpel was visible at the base of the peduncle, while in other instances two carpels sprung at once from the tip of a common peduncle. No trace of ovules in these cases was visible, but the marginal placenta was manifested by a slight swelling. Other ovaries occurred approaching more nearly to the normal structure, but consisting of two carpellary leaves only, and having two distinct stigmas. In these the gradual change from marginal to central placentation was perfectly visible. A section near the apex in some ovaries exhibited distinctly two marginal placentæ; in others, however, on one side the placenta was marginal, while that on the other was entirely free; and lower down both were free, presenting the usual appearance of stigmatic cords connected with a central mass covered with ovules.

Fig. 1. An ovule in an early stage of transformation deflected on its stem, with the rudiments of a second carpellary leaf at its base. *a*. A section below the middle, showing on one side a little swelling, the rudiment of the placenta. Fig. 2. Two carpellary leaves seated at the apex of a short peduncle. *b*. A section of the same, exhibiting distinct placentæ in the larger carpel, and a fissure in the smaller, without any trace of placentæ. *c*. A monophyllous carpel, with ovules on the marginal placenta, which below this point is perfectly free. *d*. A diphyllous carpel divided just below the stigma. *e*. Ditto, showing one placenta free, and the other attached.

In one well-formedmonophyllous carpel the same structure was extremely plain; in this case, however, ovules were formed on the placenta while yet attached to the edges of the carpellary leaf. It appears, therefore, certain that in this instance the placentation is essentially marginal, but that at a very early period of growth the three placentæ, separate from the base upwards, forming a central solid mass below, but evidencing their primitive distinction by the three cords connected with their respective stigmas. Great differences were observed in the positions of the sutures. In some ovaries they were uniformly directed to the axis, in others, on the contrary, they were external, according to the particular carpels of the normal capsule which might chance to be developed, the other being altogether repressed or merely rudimentary. The transformed ovules, it should be observed, were often much distorted in consequence of having so little room for development, and frequently bent backwards to the bottom of the capsule. *M. J. B.*

HOW TO MISMANAGE A GARDEN.

Chapter VIII.—Autumn will be a most fortunate season for you if you desire to shine in the great art upon which you are receiving instructions. Then, and in winter, occur many good opportunities of displaying skill, by producing effects that are sure to be visible through the succeeding and perhaps many succeeding summers. If indeed they are steadily persevered in, ten to one you will have a garden as trim as a school-boy's play-ground in less than no time.

Now is approaching the time for pitting late Potatoes. Dig a hole for them in the ground in the full sunshine, line it with straw, fill it at least a yard deep; put some straw over the Potatoes, and then cover them with mould. In this way you will keep them nice and warm; and as Potatoes come from South America, which you know is a warm part of the world, it must be right to keep them warm. Thus preserved, you will always be able to get at the Potatoes, and you can easily satisfy yourself of their being warm, by putting your hand in. In these days you may perhaps find also some pretty white cottony threads spreading over them; Nature will probably provide them with cotton night-caps, which must help to keep them warm. People who set up for observers, and pretend to be wiser than their neighbours, do say that they smell dry rot in the cotton, which they maintain is nothing but a fungus in disguise. But a Mushroom is a fungus, and you will judge whether the cotton is a Mushroom. Why, it is no more like it than an egg is like a game-cock, or a grub like a cockchafer.

Should matters have been managed rightly, it is pretty certain that a good many of the Potatoes will be diseased by the time when spring arrives. That will be a subject of further congratulation; for has it not been ascertained that diseased Potatoes give the best crops? And if you should not want all the rotten ones for sets you can grind them into starch, by which you will have the opportunity of showing your economical as well as horticultural talent.

As it may be forgotten hereafter, and as it would be a matter of regret that any such invaluable maxims as these should be accidentally omitted, a few words more on the Potato should be treasured in the memory. In the first place always take up the crop, while the skin will slip, if pressed upon by the thumb; this will insure soft watery Potatoes, which are more pleasant than hard mealy ones, better suited to weak digestions, and take less fire to cook. In the second place, never plant in the autumn; for if you do, the roots will be chilled in the winter, instead of lying comfortably warm in a snug pit. Instead of planting Potatoes in the autumn, put it off as late as you can; say till June, when the earth is warm, and you are pretty sure of fine weather. That was the Irish plan, and if you read newspapers, you will recollect what great advantage attended it. Finally, when you manure this root, always use the strongest and rankest stuff that can be procured. You will have fine long haulm, and a great promise of a crop.

The first frost will bring down all the leaves that the dry autumn has left hanging on the trees. They are a nuisance already; the ground is covered with them, and a gardener has enough to do in sweeping them away. Some people lay them in heaps, and let them rot, and fancy they make capital manure. A gardening genius will not follow so childish an example. For what is the use of leaves? if they were wanted by trees they would not tumble off; a man might as well treasure up his teeth after they are drawn, in the hope that they will help the remainder. If you do save them they shrink away to nothing. Much better burn them, or dig a hole in the ground and bury them; then they can't blow away again and put you to trouble over

again. By carefully sweeping them off your borders and destroying them, the further advantage is gained of diminishing by degrees the size of the leaves borne by trees another year; and if you do but go on long enough, it is not unlikely that trees will cease producing leaves, and then there will be no more trouble in sweeping them up.

Attention to these rules may be beneficial in other respects. There is the Strawberry; a dirty, ugly, ill-looking plant when the fruit is over. By all means mow off its leaves in August: or if you forget it then do so now; better late than never. You will soon see a crop of bright green leaves peeping above the ground, and mending the appearance of the beds, which will get quite a vernal appearance. The worst of it is that when spring itself comes the shoots may not be so strong as could be wished, and the fruit may be smallish. And so with Vines; in our short summers we have not half sun enough for the Vine: to quicken the ripeness of the berries, by all means pull off plenty of leaves, so as to expose the bunches. There can be no objection to this; for what is the use of the leaves between the sun and the berries? If the last do not become sweet, that only shows that even the skill of a mismanager is insufficient to ripen Grapes in England. *Κήπουρος.*

WHAT THE FRENCH SAY ABOUT THE VINE MILDEW.

In the month of March, 1849, several of the market gardeners in the environs of Paris, and the gardeners of the ancient royal residences, observed, in the houses in which Chasselas were forced, a sort of ash stain the leaves, spread more and more, and cover most of the bunches, the berries of which were then beginning to appear. Vegetation was checked; the shrivelled berries, which had a sort of mushroom smell, grew but little, and although some bunches continued to grow, the fruit which escaped the blight was poor, bitter, misshapen, covered with a hard crust, clotted, sooty, cracked, so that the seeds were visible, scarcely two-thirds the proper size, and nearly the whole crop was lost.

In the June following a similar phenomenon was observed in the open air near the houses which had been visited in the spring. The blight originating in their vicinity spread rapidly in the direction of the winds, and for 300 or 400 yards round no Vine pole, trellis, espalier, or counter espalier, unprotected by trees or high walls, was free from it. A similar thing occurred this year, and although in the places attacked in 1849 the disease may this time have been a little less intense, it unfortunately spread over a much greater space. It has appeared, too, in several new places. The varieties which suffered most were the Frankendale, then the Muscat, then the Chasselas, the Raisin-gris, and the Madeleine. In these cases every berry less than half grown, when attacked, is generally lost; in those that are more than half grown, the disease is mild or altogether absent. This mildew is nothing but a parasite of the same class as the transient mould, which, in circumstances favourable to its development, spreads with alarming rapidity. It appears on the upper surface of the full-grown leaves in the shape of whitish crowns, with corroded centres; it takes complete possession of the young shoots, and causes their dried edges to become crisp and to turn up. In the bunches of Grapes, it first attacks the central stem and its great offshoots, fills up the spaces between the ramifications, spreads in every direction over the peduncles, and envelopes the berry in its accursed web.

Struck with the apparent similarity of this species to the mildew (Oidium leuconium *Mérat*) on Rose trees and Pansies, and, desiring to ascertain the points of resemblance or of difference between these minute fungi, I asked M. Augrand, whose Vines were attacked as well as my own, to assist me in examining them microscopically. A Pansy leaf and a berry of attacked Chasselas were put successively under a glass magnifying from 300 to 400 times. Both were exactly alike, and resembled an ice plant on a small scale. There was exactly the same crystalline, confused, fleshy, transparent net-work, with naked, and often moniliform threads, plunged in the parenchyma, shrivelled at the points of insertion, and surmounted with corpuscles, which were either solitary or grouped in elongated gland-shaped bunches. The mildew of a Rose tree, examined immediately afterwards, was found to be exactly the same thing; nor is the parasite peculiar to these three plants, for a few days afterwards I found it in an open field, a mile and a half from the centre of infection, on Sinapis alba and Polygonum aviculare; they were so covered with it that the slightest touch brought down from the Sinapis a cloud of sporules. Having then to deal with a transient mucor, the following means were taken to prevent its ravages. *Brushing* is not of much use, in consequence of the impossibility of practising it on a large scale. *Washing* is of no use if water is used alone, or with a little lime or alum. Had not the season been so far advanced, I should have tried weak acids; they are easily applied, and one or two experiments with them seemed satisfactory. *Disbudding.*—Last year, as well as this, I thought the parasite sprouted, more especially in the shade. I acted accordingly, but in consequence of more than one contradictory observation, and of the fact that the upper part of the leaves only is attacked, I can offer no positive statement on this head. *The Removal* of the attacked bunches and leaves is certainly the best thing that can be done at first, but it is impracticable when the parasite has been scattered by wind. *Tobacco Smoke.*—M. Crémont, a great market gardener, in whose houses the scourge first appeared last year, observed its daily progress in a small temporary house, and, justly alarmed, he carefully removed the attacked parts, washed the rest at intervals, closed the house as completely as possible, and burnt in it several pounds of Tobacco. This was very successful. A short time afterwards the blight appeared in a permanent house, tobacco was again tried and failed. A fumigation which was easy in a narrow house, became ruinous and impossible in a larger one, and in which were several delicate plants that were in all probability not improved by the process. *Dusting.*—The uselessness of lime and alum in solution has already been mentioned. Flowers of sulphur scattered over the plants, previously well washed, gave better results. The trials were not however sufficiently numerous to enable me to recommend this method with any confidence in its success. *Comptes rendus.* [It is clear that these French gentlemen never read the *Gardeners' Chronicle*, which nevertheless has a considerable French circulation.]

GARDENING IN HOLLAND.—No. III.

At Antwerp the only time I could spare for gardening was given to the noble vegetable market, extending throughout the whole of the grand street—the Place Mer. Here not alone the extent was surprising, but the regularity in which the materials were placed; small baskets of curious form occupying the front rank, and the larger behind; the pictorial dresses of the women, some having bright brazen vessels for milk beside them, and the rich glow produced by countless baskets of cleanly washed Carrots, altogether produced a sensation not easily forgotten. The Cauliflowers, which were very abundant, did not appear to have been grown at Antwerp; and I afterwards found that they came from Holland. It would puzzle our English cooks and gardeners too, to know what use could be made of such a quantity of Purslane; but each market-day brought its fresh supply. This market delighted me 12 years ago, and it had lost none of its pristine interest. It is here we see how the Dutch and Flemish masters made up their pictures, and it required no stretch of imagination to believe that some paintings actually were taken from the persons I had seen, so little is costume or Dutch complexion altered. Since I was here, the citizens have done honour to themselves, by erecting a magnificent statue of Rubens; and what is still better, have placed it in precisely that spot where the Cathedral is seen to best advantage, the statue breaking the uninteresting roof, whilst, on either hand, its beautiful details and grander features appear as though they were made for the figure, and it for them. It is perfect. And now by one bound I am at the Hague, and in the King's garden, where, as the catalogue informed us, were the finest, the rarest, and best of specimen plants to be sold by auction.

My expectation was raised very high; all I had hitherto seen justified the assurance that if private enterprise could effect so much, that the right direction of wealth and princely power would command absolute horticultural perfection. Alas! how these fairy visions vanished before the reality. What was my disappointment when I saw that most of these specimens were out of health; some had been badly trained, and none showed that they were at home and happy—none, as our exotics do at Kew, smile upon us gratefully for their culture. Turning to my catalogue, I felt that its compiler imagined how fine these things could be, and described what he imagined rather than what he saw.

There certainly were a few good tree Ferns, and a Bamboo, and a Pandanus or two well grown; but the Oranges, Orchids, and Stove plants were most disappointing. Notwithstanding all this, the Dutch newspapers contained paragraphs to the effect that the finest Rhododendron arboreums in Europe had been sold for certain numbers of florins; but I thought the writers of the articles could never have seen those at the Exotic Nursery, Chelsea.

For old recollection sake, notwithstanding that the railway would have conveyed me to Leyden in an hour, yet I preferred to enjoy the quiet of transit by trackschuyt on the canal, which occupied three hours. The evening was fine, and the gardens and summer-houses that gem the margin for miles were nearly all peopled, showing that here in the same latitude as that I had left, it was the habit of the people to live more in the open air.

At Haarlem I visited a few grounds devoted to the culture of bulbs; of course at this season there were but few things in blossom. It however afforded me the opportunity of seeing the soil in which the Hyacinths are grown. Their mode of treatment is so well known as to require no comment. I may here remark that 30 years ago I raised Hyacinths from seeds, and produced good flowering bulbs that were in appearance equal to those imported, but this was done at too great a cost to be profitable. I am convinced, however, that we have many spots in England that would grow them at as little expense as they are produced for in this neighbourhood; but it would require that the cultivator should entirely devote himself to that single object. We, the nurserymen of England, are attempting too much; we are nearly all aiming at the whole round of culture; whereas, were one to fix himself solely to the culture of pot plants, another to bulbs, a third to fruit trees, a fourth to forest trees and flowering shrubs, and the like, all might be better done. This we repeatedly see amongst amateurs who devote themselves to Tulips, Carnations, Auriculas, and Pinks; and let me here ask, what nurserymen by profession can compete with them? I can imagine that as civilisation and refinement extend, and the taste of gardening and the appreciation of the beautiful becomes general, that this sub-division of labour will follow as a consequence; and that a purchaser one day will no more think of going to a fruit tree grower for his Roses and Dahlias, than he would now call upon his butcher for capons or turkeys. The truth of this was never more apparent than by comparing a small collection of curious forest trees with anything of the sort I had seen at home.

At this place no other culture was attempted, and the quantity of grafted Oaks (many of kinds, if not unknown at least rare with us), of Acacias, Caraganas, and rare variegated trees, fully convinced me of the advantage that would accrue, were nurserymen to circumscribe their energies to one kind of practice. My next will give an account of the present state of the Botanic Garden at Leyden. *William Masters, Exotic Nursery, Canterbury.*

VILLA AND SUBURBAN GARDENING.

Every plant which blossoms in winter and early spring, is on that account doubly valuable; hence, no conservatory or greenhouse ought to be without the Chinese Primrose (Primula sinensis), however common it may have become. I will, however, now more especially direct attention to its improved varieties, under careful culture. The size of the flowers have been greatly increased, and the colour of the pink variety has been brought many shades darker; the edges have become deeply fringed, which, probably, may be considered no improvement in the eye of a florist; still "variety is charming."

Some of the single varieties of the Chinese Primrose are exceedingly handsome, and being of easy culture they are everybody's flower. Improved varieties are only to be obtained by careful attention to the saving of the seed, selecting such only as are really fine, and keeping them apart from inferior kinds. They should be placed in a situation where they will receive abundance of air and sunshine. In close houses, and at a distance from the glass, they scarcely produce a perfect seed. If the seeds are sown in the beginning of summer, the plants will be strong enough to bloom at Christmas. Their whole culture may be perfectly accomplished in a cold frame or pit, taking care when the plants are young to shade them during scorching sunlight. Beautiful kinds have been raised by crossing the white with the pink, and *vice versâ*, the seedlings partaking of both parents. Singular and interesting shades of colour have been thus produced. Seedlings soon flower, and afford an early opportunity of discarding all inferior varieties; none should be cultivated but such as are really handsome. Those retained may be shifted into flowering-pots, for the purpose of promoting their growth, and inducing a fine bloom.

The soil which I have found to answer well for them, has been equal parts fibrous loam and leaf-mould, with about one-sixth of silver sand. These should be well intermixed when in a rather dry state, and kept under cover until wanted; because, when a prolongation of flowering plants is desired, it may not be either convenient or favourable to pot them all at one time. I would suggest that some of the seed be sown early in the year, and that a couple of sowings follow; by this mode a succession will be obtained; all the plants which are really fine should be carefully preserved, to flower a second season. These will form strong plants, which can be brought into a little warmth late in autumn, and can, consequently, be made to flower earlier than young plants. The old specimens, when done flowering, should have a cool shady place, unless it may be plants from whence seed is to be obtained. A north aspect, protected from wet, will answer the purpose. They must be kept dry, and should have a rather prolonged season of rest. This is absolutely necessary. *Pharo.*

Home Correspondence.

Victoria Regia at Chatsworth.—The original plant of Victoria regia, which was received here from the Royal Gardens at Kew, and of which a description and particulars were given in a previous paper, has now produced its 140th leaf and 112th flower bud; during the season of the plant's partial torpidity, a few of the buds then produced were removed at an early stage of their growth, lest so constant a succession of flowers should debilitate and prove otherwise detrimental to the health and vigour which it was desirable the plant should sustain. The whole of those permitted to remain expanded their blooms perfectly, although during the brightest weather in summer it was found advisable to afford some degree of shade to the flowers, in order to prevent their becoming too fugitive, perishing in much less time than two days, the usual period of their duration. This old plant has now 17 leaves, some of which are of a very large size, although there is an evident diminution in the dimensions of every leaf which now expands, evidently indicating that the plant is fast approaching its period of rest. From some of the early, as well as the more recent flowers, an abundance of fine plump seeds have been procured, from which a large number of strong plants have been raised

and, by the kindness of the Duke of Devonshire, have been widely and liberally distributed. The seed of the young plant, which now occupies the tank of the new house formerly described, was sown on the 12th February last in a small pot, and placed in the tank occupied by the parent. The first leaf made its appearance on the 11th of March, just one day less than a month after being sown. When the young plant had become sufficiently established, it was placed in the centre of the large tank, shown at p. 549—in the mound of soil prepared in the same manner as described for the old tank. This was done on the 26th of June. The plant was partially sheltered for a few days, with a two-light frame placed over it, upon planks, until the growth commenced. When established the leaves unfolded rapidly, and the first flower-bud made its appearance on the 28th of August, which opened in its white and fragrant form on the 5th of September, and fully unfolded its centre on the following day; at this stage of its growth the leaves were 4 feet 8 inches in diameter. A gradual increase in size has continued since that time, and the dimensions at present are about 5 feet, with a constant succession of flowers. The growth is remarkably vigorous, and the leaves appear very likely, in a short time, to reach the outer wall of the tank, although the diameter is 33 feet 6 inches; and, if we might judge from present progress, there is little doubt but next year the leaves will be much larger than any we have yet seen; indeed, at present, nothing can exceed the luxuriant and healthy progress the whole plant is making. The various species of Nymphæa, and other plants in the small tanks also, grow with remarkable rapidity. Amongst these may be mentioned Nymphæa cærulea, rubra, Lotus, dentata, and odorata; Nelumbium speciosum, luteum, and others; and altogether the structure must be considered most satisfactory, as every species planted in it flourishes to a degree seldom met with. *Joseph Paxton, Chatsworth.*

Orchids. — Is the enclosed flower Mormodes aromaticum? [Yes.] The pollen masses, when removed, have a powerful odour of Vanilla, quite different from the general odour of the flower. I have a plant of Oncidium Cebolleti, which has thrown out young growths from every joint of the flower stem. Is that unusual? [Yes.] Would Orchids grow in peat charcoal? [Don't know.] *W. D. H., Clonmel.*

The Wilmore Surprise Pelargonium.—I regret that I was led into an error respecting the possessor of this flower. Before I wrote to you I consulted my plant foreman, who once wrought in the Birmingham Botanic Garden; he also thought that the seedling had been found at Oldford, and he heard something to that effect in London last May. I also regret that Mr. Westcott did not read my notice of it carefully before he wrote to you; it would have saved him from the error of supposing my plant to be a seedling. But I write more particularly to assure Mrs. Wilmore that my double Pelargonium shall never come into competition in the market with her Surprise; and that I hope she will get a ready sale for it after what you have said of it; backed, as it is, by Mr. Westcott's experience, there can be no fear of its turning out a most useful bedder. I cannot, however, subscribe to the doctrine, that a seedling of any kind, be it ever so curious, can be half so surprising as those derangements of existing forms which it is the province of morphologists to explain and account for; and as to a bed of Hollyhocks or a bed of Horse-chestnuts having had an influence on this or any other seedlings out of their own families, we ought not, even by implication, to countenance the idea; at least, men of education should not do so. *D. Beaton.* —— Some of your correspondents seem to have discovered a mare's nest, for double Pelargoniums, with from seven to nine petals, scarcely deserve the name of semi-double flowers. For more than 20 years the old double purple has been common enough; on any market morning in Farringdon or Covent-garden it may be bought for less than a shilling; and it is no unusual occurrence to see it in the hawker's baskets, though those gentry are by no means so much enamoured with it as some of your readers. I suspect the Wilmore Surprise to be identical with it, at least the wood-cut you have given very closely resembles it. During the season we have bloomed here several dozens of an old kind, known as Eliza Sauvage, and every flower has been self coloured, and most of them semi-double, some flowers producing a dozen petals; but we thought so little of them that the whole have been thrown in the rubbish heap. Story's Mont Blanc, comparatively a new kind, almost invariably produces semi-double flowers; and I imagine that the Album planum of Mr. E. G. Henderson's list is the double form of Mont Blanc. Double Pelargoniums are by no means a new feature; but I grant that whoever succeeds in raising a good double kind will deserve well of the public. Next season I shall certainly try my luck, taking the old double purple for one parent, and one of the fancies most inclined to produce six or seven-petalled flowers for the other. Notwithstanding what Messrs. Foster, Beck, Hoyle, and others have accomplished, I am convinced that cross breeding, so far as Pelargoniums are concerned, is quite in its infancy, and that by a judicious selection of parents more may be accomplished in two or three years than has generally been achieved in treble that time. A short time back Mr. Beaton recommended, in the "Cottage Gardener," Ibrahim Pacha as a parent to breed a new class of bedding Pelargoniums from, but to attempt to breed from such a flimsy ragged thing is a waste of time in the present day. I have thrown scores of seedlings superior to Ibrahim Pacha away this season. *H. Rosier, Brooklands Nursery, Blackheath.*

Postage Regulations.—I beg to call your attention to the new Postage Act (10th and 11th Vic., cap. 85), which charges every paid letter returned double. This is not only injurious to the revenue, but is a great drawback to the trade and commerce of the country. *A Subscriber.* [A very great improvement, in our opinion. The *random transmission* of circulars has become a nuisance to everybody.]

Double Flowering Heath.—Have any of your readers observed a disposition in Heaths to produce double flowers? While dressing some plants the other day, I remarked three or four double blossoms on Erica Wilmoriana, an example of which I enclose for your examination. *Cliftonia, Sept.* 23.

Roberts' Strawberry Tiles.—I am surprised to see so many noblemen and gentlemen's signatures quoted in favour of these tiles. I find no good to result from their use whatever; but the reverse. They scorch the fruit before it is half ripe, entice and harbour vermin, prevent rain-water from getting to the roots, unless hand-watering is resorted to; and I am sure that all who have used them must confess that the truss of fruit entirely overhangs the tile, and the two ends are altogether deficient, except for small growing kinds. My employer has been written to for his signature, but before he gave it, he asked my opinion respecting the tiles. I told him they were worthless, having previously applied them to four kinds of Strawberries. Now if I have misapplied them in any way, I shall be thankful to any one of those noblemen's or gentlemen's gardeners who may approve of them to correct me, and show me what benefit they have derived from them; if the tile is to be used at all, there is room for much improvement. But as economy is the leading feature of the day, it is a duty to our employers, as practical men, to reject everything that is not an improvement; for it is only by practical men that the value of such articles can be fairly tested; and who is the gardener holding anything like a large place, who cannot contrive a dozen other things more to the purpose, and better for vegetation, at no expense? We all know that in large gardens there are enough of necessary expenses, without incurring foolish ones. I may add, that I have the good fortune to serve one of the most liberal employers and greatest promoters of horticulture in England; but that is no reason why his money should be spent foolishly on things from which no benefit can be derived. *D. Kidd, Garnston-park, Hereford, Sept.* 18.——I tried Roberts' tiles two seasons back; since that period they have been unused. The principal objection I had to them was, that one pair of tiles would not keep the fruit of one plant clean; and I believe few will deny the uselessness of expecting fine large fruit if the plants grow so closely together as to admit of the tiles forming a compact mass; for two-year old plants they are perfectly useless, as the fruit and foliage would cover a space twice as large as the tiles. I cannot help saying that I think it the duty of a journalist to guard the public against useless whims, particularly such costly ones as Mr. Roberts would encourage. *G. T. W.*

A Magnum Bonum Plum Tree at Grey's-court, Henley, has upon it 621 Plums. The tree is 15 feet in height and 20 feet in width; it is so covered with fruit that the branches and leaves can scarcely be seen. The Plums are very large, of a fine rich colour, and excellent in flavour. *Anon, Sept.* 21.

Potatoes.—I planted four sorts this year, viz., Manleys, Oxford Kidneys, York Regents, and Early Purples. They are now all out of the ground and housed, and the effect of the disease upon them is as follows: first bad, second not so bad, third better, fourth scarcely touched. In point of produce I have about an average crop; the Early Purples are the best in every respect, both in size, yield, and condition. *Falcon.*——The following little experiment may be useful. In April last two rows, side by side, of 6 yards each, were set with red winter Potatoes. One row was manured in the usual way, the other was not. When the plants of the unmanured row appeared above ground, they were watered with cows' urine, diluted with water. The plants, as they grew, assumed a strong dark green colour. A few days ago the Potatoes were dug up. The unmanured row (fine tubers and not one small) produced 30 lbs.; the manured row (several small tubers), 20½ lbs. *E. Edwards, Penegoes Rectory, Sept.* 18. ——I commenced taking up my Potatoes, which were planted on moss land, on the 11th of September, and I find my produce is at the rate of 186 loads per acre, of 240 lbs. to the load. They are of first-rate quality, although about the 1st of August they were attacked by the blight, which appears to have been general throughout the country, and which led many to suppose that the crops would be destroyed, as in former years. I however allowed mine to remain in the ground up to the time above stated, examining the tubers daily in different parts, for the tops were completely destroyed by the blight. I however never found any appearance of disease amongst the tubers. *M. Saul, Garstang, Sept.* 21.

Leeks.—As "Taffy" has from time immemorial been a great patron of the Leek, he ought to know something about its cultivation. His practice is quite at variance with the acknowledged principle, that the leaves are the lungs of the plant, as twice in the course of its growth he cuts off from the extremity of its leaves or flag about 3 inches from its point. Is he right or wrong? *L., Llandilo.*

Societies.

Royal Horticultural of Ireland, *Sept.* 12.—At this, the autumn show, a fine display of gardening produce was exhibited. At this late period of the year, exotic plants are seldom numerous or fine. The showy and generally admired Pelargoniums are on the wane, and Fuchsias grown in pots are now past their best. Notwithstanding this, however, the stages were well filled at the late show, and the plants generally were in good condition. One competitor only appeared at this, as well as at the last show, for the Lord Lieutenant's prize for the best 12 Exotics; which, being the highest the Society has to offer, is not a little surprising. The plants in the group exhibited were tolerably well grown, but none of them of very recent introduction, nor otherwise remarkable. For the Society's prize of best 12 Exotics there were three competitors, and some good plants shown. Dipladenia splendens, Chironia viscosa, and other rare plants, were among the group which obtained the first prize. For the best 8 Exotics there were also three competitors. The first prize group was a nice lot, containing plants of Chætogastra strigosa, Adamia versicolor, which, with the others, were well grown. The prize for the best Exotic in flower was obtained for a nice specimen of the East India Moth plant; and that for the best Exotic in foliage, for a huge specimen of Musa Cavendishii—the Cavendish Plantain There was only one small group of four Orchids exhibited for competition. The collection of Heaths was the worst we ever saw exhibited in the Rotunda—mostly out of bloom; and, indeed, in such a state as would have warranted the judges in disqualifying the whole of them. There were three competitors.—Among the Nurserymen there was only one solitary competitor, who had the prizes awarded to him as a matter of course.—From the Royal Dublin Society's Botanic Garden, Glasnevin, groups of beautiful Orchids and Liliums were furnished. Among the latter was a finely-bloomed plant of the rare Lilium Wallichianum, which was recently sent to Mr. Moore from the Himalayas, and bloomed in that establishment for the first time in Europe. It produces the largest flowers of any of the species yet introduced. A large plant of Stanhopea Wardii was suspended from the roof, the curiously-shaped flowers of which attracted much attention. The show of Dahlias was probably the best ever seen in Dublin. The large marquee on the lawn was nearly filled with groups of these gorgeous flowers. The fruit was also exceedingly good, and in profusion; but the vegetables were unusually scarce, a circumstance which calls for the immediate attention of the Society. The deficiency in this department, at our horticultural exhibitions, is amazing. Our fine gardeners would probably regard it as little to their credit to carry off prizes in this department! *Dublin Advocate.*

Royal Horticultural of Cornwall, *Sept.* 6.—The prizes were awarded as follows: Finest Pine-apple (Black Jamaica), Mr. Williams; 2d (Queen), Mr. Vivian. Best Melon, the Silver Medal (Teneriffe), Mr. G. N. Simmons; 2d (King's Own, green-flesh), Mr. Daubuz; 3d (Pinkey Prize), Rev. Canon Rogers. Best Dish of Grapes (Muscats, West's St. Peter, Black Prince, Black Hamburgh), Mr. Vivian; 2d (Royal Muscatelle, Black Hamburgh, Red Muscadine, Tokay, Black Prince, Black Frontignan), Admiral Reynolds. Best Bunch of Grapes (Muscat of Lunelle), Mr. Vivian. Best 6 Peaches (Noblesse), Rev. Canon Rogers; 2d (Bellegarde), Sir C. Lemon, Bart.; 3d (Ford's Seedling), Mr. Vivian. Best 6 Pears (Bon Chretien), Rev. T. Phillpotts; 2d, Admiral Reynolds. Best collection of Pears (Beurré d'Aremberg, Marie Louise, Beurré Diel, Bon Chretien, Napoleon, Epine d'Hiver, Old Chaumontel, Chaumontel Besi, Glout Morceau, Duchesse de Angoulême, Buchanan's Spring Beurré, Bergamot, Louise Bonne), Admiral Reynolds. Best 6 Nectarines (Violet Hâtive), Mr. Daubuz; 2d (Elruge), Sir C. Lemon, Bart. Best 12 Apples (Irish Peach), ditto; 2d (Kerry Pippin), Rev. Canon Rogers; 3d (Lucombe Seedling), Rev. T. Phillpotts. Best collection of Apples (Kerry Pippin, Brown Spice, Red Quarandine, Sops of Wine, Autumn Pearmain, Box Apple, Golden Apple, Gilliflower, Ribston Pippin, Lemon Apple, Shelston's Pippin, Hawthornden, Brandy Pippin, Russet Nonpareil, Adam's Pearmain, Cornish Aromatic, Old Nonpareil, &c.), Rev. Canon Rogers; 2d (Old Golden Pippin, American Pippin, Crofton, Skyehouse Russet, Court of Wick, Spice Apple, Winter Warden, Ribston Pippin, Royal Russet, Nun's Pearmain, Early Nonpareil, Old English Nonpareil, Mollet's Guernsey, Golden Pippin, Cornish Gilliflower), Admiral Reynolds. Best Dish of Cherries (Morello), Rev. Canon Rogers; 2d, Rev. T. Phillpotts. Extra: Nectarines (Elruge), Rev. T. Phillpotts. Plums (Caledonian), Admiral Reynolds. Peaches (Noblesse), Mr. W. M. Tweedy.—Flowers: New ornamental plant, the Bronze Medal (Gesnera picta), Mr. Daubuz. Best 12 Stove and Greenhouse Plants (Ixora rosea, Ronde etia speciosa major, Leschenaultia Baxteri, Statice arborea, Lilium lancifolium rubrum, Allamanda cathartica, Chirita zeylanica, Chironia floribunda, Pleroma elegans, &c.), Mr. F. Passingham; 2d (Æschynanthus Lobbianus, Gesnera picta, G. zebrina, Clerodendrum affine, Aphelandra cristata, Crowea saligna, Erica Hartnelli, &c.), Mr. Daubuz; 3d (Cyrtoceras reflexum, Vinca rosea, Erica vestita rosea, Begonia multiflora, B. nitida, Cuphea platycentra, Pentas carnea, &c.), Mr. W. M. Tweedy; 4th (Clerodendron paniculatum, Lilium lancifolium punctatum, Chirita sinensis, Pentas carnea, Scutellaria splendens, Achimenes venusta, Begonia floribunda, &c.), Mr. G. N. Simmons. Best 6 ditto (Æschynanthus Lobbianus, Tetratheca verticillata, Clerodendron squamatum, Dipladenia crassinoda, Pleroma elegans), Mr. Daubuz; 2d (Vallota purpurea, Leschenaultia formosa, Balsamina latifolia, Zauschneria californica, Statice puberula), Mr. F. Passingham; 3d (Justicia nodosa, Begonia incarnata. Achimenes patens, Thunbergia alata, Gloxinia Handleyana), Mr. G. N. Simmons. Best Stove Specimen (Dipladenia crassinoda), Mr. Daubuz; 2d Cyrtoceras reflexum), Mr. F. Passingham; 3d (Begonia fuchsioides), Rev. T. Phillpotts. Best Greenhouse Specimen (Adamia versicolor), Mr. G. N. Simmons; 2d (Thunbergia alata), Rev. T. Phillpotts; 3d (Hoya carnosa), Mr. F. Passingham. Best Orchid (Dendrobium Gibsoni), Mr. W. Daubuz; 2d (Oncidium Lance num superbum), Rev. T. Phillpotts. Best Heaths (Hartnelli, ampullacea, montana, Lambertiana rosea), Mr. F. Passingham; 2d (Clowesiana, inflata, Irbyana, retorta), Mr. Daubuz. Best Heath Specimen Aitoniana), Mr. F. Passingham; 2d, Mr. Daubuz. Best Fuchsias (Mirabilis, Ignea, Unique, Elegantissima, Gem of the West, Newtoniensis), Mr. Daubuz; 2d (Rose Quintal,

Fountain, Acantha, Purity, Rickard's Seedling, Dr. Smith), Mr. G. N. Simmons; 3d (Purity, Elegantissima, Corallina, Duke of Cornwall, Dr. Jephson, Exoniensis), Mr. F. Passingham. Best Fuchsia, specimen (Falstaff), Mr. W. Hockin; 2d, Admiral Reynolds. Best 12 Dahlias (Duke of Wellington, Sir E. Antrobus, Admiral Stopford, Mr. Seldon, Miss Vyse, Alice Hawthorn, Hector, Athalet, Scarlet Gem, Lilac Standard, Grenadier, Beeswing), Mr. M. Williams; 2d (Admiral Stopford, Beeswing, Sir E. Antrobus, Cleopatra, Antagonist, Princess Radziville, Box, Toison d'or, Shylock, Captain Warner, Lady of the Lake, Essex Primrose), Mr. Daubuz; 3d (Mr. Seldon, Capt. Warner, Cleopatra, Beeswing, Lady of the Lake, Box, Sir E. Antrobus, Duke of Cambridge, Shylock, Bathonia, Yellow Standard, President of the West), Mr. Vivian; 4th (Captivation, Mrs. Shelley, Princess Royal, Fulwood Scarlet, M. Adolphe, Rembrandt, Cassandra, Miss Vyse, Beeswing, Cleopatra, Hope, Bathonia), Rev. Canon Rogers. Best 6 do. (Princess Radziville, Sir E. Antrobus, Antagonist, Captain Warner, Box, Admiral Stopford), Mr. Daubuz; 2d, (Admiral Stopford, Marchioness Cornwallis, Miss Lane, Athalete, Aurantia, Fearless), Mr. M. Williams; 3d (Cleopatra, Mr. Seldon, Beeswing, Bathonia, Box, Shylock), Mr. Vivian; 4th (Madame Helena Caregliano, Cleopatra, Box, Sir Robert Sale, Lilac Standard, Lady of the Lake), Mr. W. M. Tweedy. Best Collection of Roses (Bouquet de Flore, Bourbon Queen, Dr. Marx, Lawrence de Montmorency, Jenny, Grenadier, Mrs. Elliott, Ophirie, Archduke Charles, Prince Albert, Prudence Procter, Safranot, Souvenir de la Malmaison, Géant des Batailles, Mogador), Mr. M. H. Williams; 2d (Souvenir de la Malmaison, La Reine, Baron Prevost, Safranot, Countess Duchatel, Mogador, Bourbon Queen, Mrs. Elliott, Prince Albert, Lawrence de Montmorency, Bouquet de Flore, Louis Philippe, William Jesse, Comte de Paris, Géant de Batailles, Ophirie), Mr. M. Williams. Best collection of Hollyhocks, Mr. M. Williams. Best collection of Asters, Mr. Vivian; 2d, Sir C. Lemon, Bart. Collection of Cut Flowers, Mr. G. N. Simmons. Best collection of Bulbous Plants (Lilium lancifolium album, punctatum, roseum, and speciosum; Vallota purpurea), Mr. F. Passingham. Best Verbenas (Robinson's Defiance, Ibrahim Pacha, Satellite, St. Margaret, Favourite), Mr. W. M. Tweedy; 2d (Louis Napoleon Bonaparte, St. Margaret, Tricolor alba, General Lamoriciere, White Perfection), Mr. G. N. Simmons. Best Marigolds, Admiral Reynolds; 2d, Sir C. Lemon, Bart. Extra: Zinnias, Admiral Reynolds. Achimenes, Admiral Reynolds. Balsams, Mr. F. Passingham.

Reviews.

The Course of Creation. By John Anderson, D.D. London: Longmans, 8vo; pp. 420.

This work is an introduction to the study of Geology, in the shape of essays on the character of the country, passed through by a person starting from the Grampians and proceeding to the Alps by way of England and France. The author tells us that having studied Geology as an amusement, and collected together a considerable quantity of notes, both of his own observations and of those of others, he was induced to publish them, in the hope that they might lead other people to employ their leisure hours in the study of the same interesting science. "Having," he says, "gathered, and now put together in this form, the notes of my researches, I do not mean to aver that I have visited every locality referred to, or personally observed everything noticed in the publication. Where so much has been done by others I have carefully examined their works. Where the field is so boundless, and the course of illustration necessarily so discursive, I have freely made use of their collected materials. Still, I have been induced to adopt the line of description from the Grampians to the Alps, because, at sundry, though often distant periods, I have examined the various suites of rocks comprised betwixt these mountain boundaries. If there be any novelty in the volume, it will be found not in the subject-matter itself, nor in the mode of treating it, but by following the geographical sequence in the description of the several geological formations, and their relations to each other in the countries passed over."

Accordingly the author commences with an outline of the geology of Scotland, describing in this, the first part, all the lower formations from the primary rocks to the carboniferous system. In the second part, in which he treats of the geology of England, he notices the Permian and Oolitic systems, the Wealden formation, the Cretaceous and Tertiary systems, and the mammoth period. In Part III., the physical union of France with England, the geological structure of Switzerland, the Alps, Mont Blanc, the Boulder formation and Glaciers, as well as the thickness of the earth's crust, together with the theories of central heat, are discussed and examined. The fourth and last Part contains an outline of the general principles of the science, and an examination of the points in which the conclusions arrived at by modern geologists are at variance with the mosaical account of the creation.

The author's style is clear and familiar, and the work is worthy of a perusal by all lovers of Nature, as well as by those, if any there now be, who are afraid that the study of natural history and of geology in particular, should tend to bring religion into disrepute, and to lower the moral and intellectual character of man. In what point of view the author regards geology will be apparent from the following extract.

"The magnificent work of creation, whose course we have been tracing in some of its primordial arrangements, in the geological phenomena of the earth's crust, and in its relations to the vast planetary system of which it is a member, is the result over all of design and intelligence. The changes wrought in the earth's structure and framework, from period to period, have not been brought about by merely mechanical changes of physical conditions. There are order and method in the inorganic, no less than in the organic forms, into which matter in any of the earth's revolutions has been cast. There is prospective contrivance, each for each. The alterations made in the outward surface, whether of sea or land, have been always such as were best adapted to the habits and requirements of successive living tribes. And the whole amount of change, in both departments of nature, has ever been in such measure and degree as to show, from the beginning, a persistent principle of stability in the system, and a wise, all-controlling arm, to be regulating and directing everything. The invisible things of God, from the creation of the world, are clearly seen; and we cannot, if we would, rid ourselves of the thought, that somewhere and beyond, there is, not a 'primitive cause' only, but a Divine Being, the master of the universe, potentially in and present through all things."

"The researches of science, the deeper they go into the secrets of nature, issue in the surest and brightest disclosures of the Divine Architect of the universe. We are enabled, by the lights which are furnished by the various branches of ascertained knowledge, to read in some degree the mind and purpose of God in the creations of his hand. We see in many instances what is actually intended by certain arrangements and combinations—why, and for what end, objects are constructed in a particular way, and how it is that trains of events are made to follow in one uniform order rather than in any other. The universe, we discover, is not only bound by laws permanent and unchanging: the laws themselves have an end to serve, a particular result to accomplish. Accumulations of matter are brought together with a definite precise view; living substances are constructed with organs suited to their conditions of existence; relations of air, earth, and water, are established, which nicely answer the functions to be performed; and in ten thousands of cases are manifested the form, size, position, qualities of hardness, softness, and cohesion in the individual parts which can best secure their own special well-being along with the general conservation of the framework to which they are attached."

There are a few good woodcuts of fossils, &c., for the purpose of illustrating the text; but there being no index, a student cannot find, without considerable loss of time, any cut he may wish to refer to.

Garden Memoranda.

Messrs. Paul's Nursery, Cheshunt.—Containing as it does many thousands of Roses of all classes and descriptions, it is scarcely possible to visit this "garden of the Queen of Flowers" at almost any season of the year, except, perhaps, the very "dead of winter," without finding something to admire—something to repay one for a visit. As early as the beginning of June the Scotch Roses, followed by the foremost of the hybrid Chinas, will be found in bloom. The former is a class of Roses quite as much cultivated as they deserve to be. The hybrids of the China, Bourbon, and Noisette, among which are to be found some of the most valuable Roses in cultivation, continue in flower from the middle of June to nearly the end of July; and contemporary with them are the Provins, Moss, Albas, Damask, and their hybrids, together with the French and hybrid Provins. A few of the best of early-flowering Roses are Brennus, Charles Duval, Coupe d'Amour, Coupe de Hébé, Frederick II., Fulgens, Lady Stuart, Paul Perras, Paul Ricaut, Richelieu, Triumphe de Laqueue, and Virginie Zechler. Among the "Moss and their hybrids" we would select À Feuilles Pourpres, Celina, Etna, Lanei, Presque partout, Princess Royal, and Purpurea rubra. These require high cultivation; but their beauty amply repays a little extra attention. Among Damask, Alba, French, and hybrid Provins, perhaps the best are La Ville de Bruxelles, Madame Soetmans, Sextus Papinius, Félicité, Parmentier, Madame Audot, Princesse Lamballe, Adèle Prévost, Boule de Nanteuil, D'Aguesseau, Jeanne d'Albret, Marjolin, Ohl, Pashot, Shakespeare, Blanchefleur, Jean d'Urfé, and La Volupté, or Letitia. Harrisonii and Persian Yellow are the two best hardy yellows in cultivation, the latter being, perhaps, the better of the two. It blooms freely under ordinary treatment, but it requires some care in pruning. The head should be well thinned, and the shoots that are left for flowering suffered to remain long. If shortened in much, a fine head of wood will be formed, but there will be no flowers. The old Double Yellow, when it opens well, is, as most people know, an admirable Rose; but it is ten chances to one if it expands its flower-buds. With the exception of Harriet Martineau and Paul Ricaut, which are not very new, few novelties of any note have been added to any of these classes lately.

Owing to the long continuance of dry weather which we have experienced this season, Autumn Roses have flowered but poorly in most places, and Messrs. Paul's Nursery has formed no exception. The Hybrid Perpetuals, not above 20 years back, limited to the scarlet Four Seasons and the Rose du Roi, but now, on account of their numbers and beauty, usually the glory of the autumnal Rose-garden are this season almost destitute of flowers, offering in this respect a striking contrast with their brethren the Bourbons, Noisettes, Chinas, and Teas, which are at present everywhere tolerably gay. This is a fact worth remembering; for the Perpetuals, with their great beauty and strong Rose fragrance, have of late been making their way into gardens, to the exclusion of the Noisettes and Chinas; but in a very dry year, like the present, and in naturally dry soils, it will be found that the latter are our most grateful friends, affording us fine bouquets of fresh Roses, which otherwise would have been scarce. We, however, remarked that Géant des Batailles, a Hybrid Perpetual, and certainly the glory of the Rosery, as far as brilliancy of colour is concerned, was flowering finely, as were also one or two others. Among the Bourbons which were in flower, some of the best were Dupetit Thouars, a very high coloured Rose; Queen, Aramis, Armosa, Paul Joseph, Aurore du Guide, Comice de Seine et Marne, Acidalie, Triomphe de la Duchesse, Bouquet de Flore, George Cuvier, Souvenir de la Malmaison, Leveson Gower, and Menou. The two latter are comparatively new Roses, and very good ones. Two Perpetual Mosses, Herman Kegel and General Drouet, are said to be well worth cultivating, but we did not see them in perfection. Among Noisettes, Miss Glegg is a nice white, perhaps in some respects an improvement on Aimée Vibert; Fellenberg is a showy crimson and a free bloomer, and Mrs. Siddons is not a bad yellow; Eclair de Jupiter is a good climber, cherry or carmine in colour, and Caroline Marniesse, creamy white, also deserves a place for this purpose. A small dwarf Noisette, called Pumila alba, is well worth having for pot culture. It forms a good companion to that universal favourite, the little pink Fairy Rose, than which few plants are more suitable for window decoration. In China Roses we noticed rather a novelty in the shape of Eugéne Beauharnais, a good amaranth-coloured flower. Narcisse, Souvenir d'un Ami, and Vicomtesse de Cazes, will be found worth adding to collections that do not already possess them; but, like all Tea Roses, they are rather tender, and will require some protection from frost. The greatest novelties among the Hybrid Perpetuals we saw, were Duchesse de Montpensier, Etendard de Marengo, brilliant crimson, and one of the best of Roses; Naomi, and Pius IX. Soleil d'Austerlitz is also a good addition to this class; but where shall we find equals to Géant des Batailles, Baronne Prevost, and La Reine? These are the cream of Hybrid Perpetuals, and the cheap rate at which they are now sold brings them within the reach of even the cottager. Comte Bobrinsky is worth attention, on account of its charming colour; and where variety is wanted, the following should be added: Baronne Hallez, Caroline de Sansal, Duchesse de Praslin, General Cavaignac, Madame de Lamoricière, Rosine Margotin, Duchess of Sutherland, and Laurence de Montmorency.

Messrs. Paul are erecting a double span-roofed house for wintering small pot Roses in. It is 80 feet long, about 20 feet wide, and 7 feet high from the floor to the centres of the spans. The wood-work of the roof consists of astragals (no rafters), placed 15 inches apart, and it is glazed with panes about 18 inches in length. Some of the uppermost panes (six in the whole length), move outwards on hinges, for the purposes of ventilation, which is also effected by means of wooden ventilators placed in the brick walls which form the sides and ends. The passages are immediately below the highest parts of the roofs, sunk, and have beds on either side, on which the plants will be placed. It is to be warmed by means of two of Mr. Rivers's "brick Arnott stoves," one at each side about half way from either end of the house. The roof consists of sixteen pieces screwed together, and, if necessary, may be entirely removed in summer.

Of other florists' flowers besides Roses, Messrs. Paul cultivate Dahlias and Hollyhocks. Of the latter they have some promising seedlings; some of the best of the named kinds which we saw were—Snowball, white; Model of Perfection, white with chocolate ground; Delicata, French white; Rosea alba, rose and white; Queen, light blush; Rosea grandiflora, light pink; Enchantress, deep pink; Fulgens, dark shining crimson; Sulphurea perfecta, sulphur; Napoleon, red and buff; Purpurea elegans, purple; Rubida, reddish purple; Coccinea, scarlet; Formosa, claret; Magnum Bonum, maroon; Black Prince, the darkest of all Hollyhocks; Mulberry Superb, also a rich dark kind; Comet, bright ruby red; Obscura, shaded puce; Blue Beard, dark ground, white edges, and veined; Miss Forbes, light rose; Wellington, rosy red.

Near the specimen Rosery, a small arboretum has been formed, which in time will be very interesting. It contains many of the best Conifers, Oaks, and other select trees and shrubs, the object being to show purchasers good examples of what they buy in a small state.

In conclusion, we may mention a mode of fumigating, which we saw here. It consisted in using small cylinders about 1 foot long, composed of alternate layers, or rolls of tobacco and match paper. These were suspended above the stone path from the ends of twigs, fastened horizontally to the stage. On being lighted at the lower end, the draught up the centre of the cylinder or small pipe kept the latter burning, and in this way a large house may be readily filled with smoke, and it is said at a very cheap rate, without any trouble, beyond that of lighting the ends of six or seven small pipes, like those just mentioned. Those who do not possess Brown's fumigator, may find this plan worth a trial.

Miscellaneous.

Spotting of the Leaves of Grasses, &c.—I have often been unable to account for the suddenness with which the leaves of Ranunculus repens, and of many Grasses (Triticum repens and Alopecurus pratensis being of the number) growing by the sides of walls, become whitened in minute specks and irregular lines all over the upper surface, as if the colour had been extracted from them, or had left some cells by a kind of elective preference for others. I have recently found this to be occasioned by a small dusky red-legged mite, which harbours under stones, but comes out in the sunshine in immense swarms to feast upon the foliage. Owing to the

numerous mouths at work, large patches, especially in the Grasses, are speedily drained of their sap and become quite dead or blighted. The mite is not described in any accessible work on the Arachnides. Dr. Johnston considers it to be a Rhyncholophus, but that the structure of the fore-legs indicates an affinity with Bryobia. From Trombidium it differs, he observes, in the eyes being sessile and on the shoulders. I have named it R. haustor. It occurs likewise upon the leaves of fruit-trees, but the dusky parts are then greener. In autumn it is much darker and more convex. It runs rapidly, agitates its fore-legs like antennæ, sloughs off its skin where it feeds, and leaves behind it an excrementitious deposit that glitters like honey-dew. *J. Hardy, Penmanshiel, in the Annals and Magazine of Natural History.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

MANY Australian and other plants, which have been set in the open air during summer, but which were thought too hardy to be put under cover in the early part of the month, should now be removed to favourable situations under glass, and there placed as near the light as possible, as the process of ripening goes on much faster than in the open air, while the plants may be protected from our cold autumnal rains. They should, however, have the advantage of a free circulation of air, which should continue night and day, unless the weather is very cold. Oranges standing in the open air should be removed into their winter quarters during the next week in most parts of England; and as all other greenhouse plants must soon be housed, the necessary preparatory arrangements should be immediately completed. The climbers in the roofs of the houses should be considerably reduced in bulk, reserving a proper selection of shoots for late autumn flowering, and for adequately furnishing the roof next summer. In addition to this means of admitting the light more freely into the house, let the glass be washed, that the plants may have every chance. Promote the growth of Gesnera zebrina, Achimenes picta and cupreata, by a strong bottom-heat, with a moderate top-heat; do not allow the latter to be too excessive, or the leaves will be less hardy in their constitution, less durable, and less useful in the decoration of drawing-rooms and conservatories, for which purpose these beautiful plants are admirably adapted. As the Japan Lilies go out of flower, let the pots be laid on their sides for a week or two, in a sunny situation; after which they must be repotted in sandy loam and a little peat, and plunged in a bed of ashes in an open situation. These plants require a very short period of rest; but although the roots are active during winter, the plants should be kept in a cool place until spring, when a few for early flowering may be placed in the greenhouse.

FORCING DEPARTMENT.

Where dung linings are used for forcing pits of any description, means should be taken to secure them from the autumn rains, which check fermentation, and cause the heat to decline at a time when it is most wanted; this evil involves a continual turning and renewal of the linings. In constructing a frame, in which fermenting material is to be employed as the heating medium, the front wall-plate should never be more than 12 or 15 inches above the level of the path; as by this means it is kept warm with a smaller quantity of fermenting material, and, at the same time, it gives the facility of covering the trenches with wooden shutters, suspended on hinges from the outside wall by one edge, and resting by the other on the wall of the trench. These shutters should be fixed with just sufficient incline to carry off the wet, and they should be made strong enough to serve as a gangway. Melons and Cucumbers must now have careful attention, to continue them in a fruitful state as long as possible. See that the lights are in good order, that drip does not introduce canker among the Melons. Water judiciously, and select the mornings of fine days for the purpose; endeavour to keep the pits perfectly clean and wholesome, by admitting at all times sufficient air to ensure a circulation. Let the walls be occasionally washed with lime and sulphur, to destroy insects. It is indispensable to keep up a good temperature, top and bottom; and if no better means are at command, this must be effected by dung linings, and by covering with mats and shutters at night. Young Cucumbers for winter forcing, recently planted, should not be stopped until they have reached the top of the trellis, when the point should be pinched out, to induce the formation of lateral shoots. Be careful not to allow the plants to be weakened by the production of clusters of male blossoms. Give sufficient heat and moisture to induce a vigorous growth, but accompanied by a free circulation of air, to ensure a sturdiness of habit; to this end, also, let the glass be kept perfectly clean, that they may have all the light possible at this season. After planting, a slight shade is necessary for a short period during strong sunshine, but they must be quickly inured to full exposure.

FLOWER GARDEN AND SHRUBBERIES.

The work of this department, though entirely of a routine character, must be strictly attended to at this season, as neglect or untidiness never shows more strikingly than when the flowers which attracted attention in summer have disappeared. Remove annuals and other herbaceous half-hardy plants as soon as they show signs of approaching decay, and let others of more hardy constitution be divested of their decaying flowers and flower stems. We have before endeavoured to impress upon our readers the fact, that a garden, to bear close inspection, must at all times and seasons wear a phase of progression, and a plant with an unhealthy appearance should be at once removed to the infirmary, if it is worth it, and to the rubbish yard if it is not. As in the eye of any one accustomed to habits of order, the bare soil has a more agreeable appearance than a neglected flower garden, the turf, the edges of the walks, the plants, shrubs, or trees, and the ground around them should wear an appearance of neatness and perfect order. Beds for Hyacinths, Tulips, and other early spring-flowering bulbs, should be prepared and planted immediately. They grow and flower in the greatest perfection when planted in a light sandy loam, which has received a liberal dressing of thoroughly decomposed manure; but which should be carefully kept from coming in contact with the bulbs, by placing a little sand round them at the time of planting. As the roots of these bulbs descend deeply into the ground, a good stratum of rich manure should be trenched in about 12 or 15 inches below the surface. In planting Crocus or other bulbs which are liable to be attacked by mice in winter, a little chopped Furze should be placed around them.

FLORISTS' FLOWERS.

Seedling Pansies will occasionally bring a fine bloom, even at this late period. If there should be any qualities giving indication of future excellence, means should be adopted to propagate it. There is some danger attending transplantation; it will be advisable, if there are any side shoots, however minute, to strip them off, and place in clean river sand under a hand-glass. If not, prune the plant, cutting away the very gross shoots, and protect in very severe weather. If beds for next spring's bloom have not been made, do so. Hoop them over, protecting from heavy cold rain. We are aware that many do not take this precaution, yet those who wish to excel, will find their account in the extra trouble. PINKS.—However careful the amateur may be in making up his bed, a solitary wireworm will sometimes escape him; the consequence is, that he has the mortification to see, possibly, some fine sort wither, and when thus attacked, the plant is beyond remedy. A vigilant search must be made in the bed, when the marauder will often be found within a short distance, perhaps not more than an inch below the surface. If it escapes detection in this manner, then cut some Potatoes in quarters, insert a butcher's skewer in each, and place these pieces of Potato in all directions in the bed. It will be far better to put 20 in, than have another Pink destroyed; and these traps will generally be found efficacious. For other florists' flowers, the directions given last week may be attended to.

KITCHEN GARDEN.

The Cardoon is the finest winter vegetable we have, and it keeps sound till March, if the earthing be deferred till the middle of October. It does not grow much after being earthed up; and as size is of consequence, it is well on this account to let the earthing be deferred as long as the plants are safe from frost. If it be intended to use haybands for binding round them, they should be prepared in wet weather, when the men cannot work outside. Continue the use of strong liquid manure to such crops as can profit by it; and especially Asparagus, to compensate in some measure for the present draught upon its energies by the seeds. Pay particular attention to young crops, by stimulating their growth where needful, and guarding them from the attacks of insects by a sprinkling of soot and lime round them. As a general preventive, which is always superior to cure, it is a good plan to work a dressing of soot into the ground, in company with animal or vegetable manure, when the operations of digging, forking, or trenching are going on. In cleaning the ground, use the fork as much as possible, in preference to the hoe and rake; nothing can be of greater benefit to crops at this season than affording the sun and air additional facilities for penetrating and permeating the soil.

State of the Weather near London, for the week ending Sept. 28, 1850, as observed at the Horticultural Garden, Chiswick.

Average....		29.790	29.691	67.4	46.8	57.1	56 6	56.3		1.54

Sept. 20—Overcast and mud; cloudy; rain.
— 21—Boisterous; fine; heavy rain at night.
— 22—Heavy rain; fine; clear at night.
— 23—Rain; cloudy; lightning in the evening.
— 24—Cloudy; very fine; sultry; rain.
— 25—Dense fog; very fine; slightly clouded.
— 26—Overcast; constant heavy rain; cloudy.
Mean temperature of the week, 1 deg. above the average.

State of the Weather at Chiswick during the last 24 years, for the ensuing week, ending Oct. 5, 1850

Sept. and Oct.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 29	64.4	45.7	55.1	13	0.35 in.	1	2	3	2	5	7	2	2
Mon. 30	64.5	45.5	55.0	11	0.38	2	1	3	1	5	6	6	—

Thurs. 3	63.5	45.0	54 2	13	1.01	1	3	—	1	7	8	2	2
Friday 4	63.8	43.4	53 6	11	0.36	—	5	2	—	5	8	3	1
Satur. 5	63.0	41.7	52.4	9	0.57	4	3	2	1	5	5	4	—

The highest temperature during the above period occurred on the 5th, 1834—therm. 80 deg.; and the lowest on the 3d, 1836; 5th, 1826 and 1845—therm 29 deg.

Notices to Correspondents.

BOOKS: *G B.* The Supplement to Loudon's "Hortus Britannicus" just published.

BUCKINGHAM PALACE: *W Th.* We see no advantage in discussing this matter, which is settled so far as the gardening part of the question is concerned.

BULBS: *W G.* There is no such plant as Brunsvigia superbiens. You will find good instructions for the management of such plants in our volume for 1849, p. 663. The sorts you name are easily made to flower, and are very pretty.

FORCING STRAWBERRIES: *G W T.* Six-inch pots will answer your purpose; but you cannot expect to succeed so well with plants so far from the glass as if they were within 2 or 3 feet of it. Of course you will feed with manure-water. Your house may be heated efficiently by hot-water in a flow and return 4-inch iron pipe, or you might try one of Mr. Rivers's brick Arnott stoves, figured at p. 51, 1846.‡

FRUIT PRIZES: *Limerick.* We can hardly advise you to incur any expense in showing in this country. If you wish to do so, the meetings of the Horticultural Society, 21, Regent-st., London, are open to you; they take place on the first Tuesdays in October and November. Medals are awarded there, but only to first-rate productions. We should say six Easter Beurrés are enough for a dish in June. Consult the published Schedules for next year.

GARDENERS' SOCIETY: *G Brown.* There is no such society.

GUANO: *H F S.* You may use it with great advantage to Pines, Vines, and all such plants. It is best administered when mixed largely with water. If you have any information that is new respecting Vine mildew, we should be obliged to you for it.

INSECTS: *Pinus.* The small beetles sent as infesting the Larch are, we believe, the Tomicus Laricis; but the specimens are so smashed and saturated with turpentine that we cannot decide. The only mode of destroying them is to collect the shoots of the present year, which are attacked, and burn them. *W.—J D.* The insects sent are females of Sirex gigas; see *Gardeners' Chronicle*, 1850, p. 517, August 17th, for description and figure. *W.—T C.* 1, Syrphus Ribesii; 2, Chrysotoxum fasciatum; 3, Syrphus balteatus; 4, S. vitripennis; 5, Tachina sp.? 6, Syrphus topiarius; 7, 8, scutatus; 8, S. Melissæ; 9, Eristalis tenax; 10, ditto var.; 11, Volucella mystacea. Some of those just received are not identical with those sent last week. Allow us to recommend your pinning your insects in the usual manner. The insects sent are not fit for the cabinet. The caterpillar is that of Mamestra persicariæ. *W.—G B.* The grubs which have attacked the Pears, Plums, and Cherries are the slimy larvæ of Tenthredo æthiops. Syringing with lime water and dusting with lime are the safest processes. It is of no use dressing the trees and walls in winter, as the grubs descend deep into the earth under the trees to undergo their chrysalis state. *W.—A S.* Your Oak leaf is covered with Oak-spangles, which are formed by minute hymenopterous insects called Cynips. ‡

IRON PIPES: *A B.* Pray explain what you really mean by "the water Corroden in iron Tank and pipes," and we will give you the best advice we can.

IVY: *H C.* Clip it when you please, say in March, and perhaps again at Midsummer. ‡

NAMES OF PLANTS: *B.* Rochea falcata; Vallota purpurea, a very beautifully coloured variety. — *B.* Apparently a very young state of Escallonia montevidensis.—*C H W.* Euphrasia officinalis, common Eyebright.—*Erzeroum.* 612. Marchantia. —*M Bartlett.* Ipomopsis elegans.—*W B Page.* Some Curcuma, probably C. leucorhiza; if not we will say so next week.—*Sweet Gall.* Hippophäe rhamnoides, a wild shrub found near the sea.—*A P.* Apparently fragments of Bromus secalinus. The first Tuesdays in October and November.—*E B E.* Peach, Nectarine, or Almond leaves.—*A B C* It is Oidium fructigenum.—*W G H.* Lomaria borealis, *Smith.* (Blechnum boreale, *Linn.*) *S.—W D H.* Adiantum pubescens, *Schkr. S.*

PAXTON'S COTTAGERS' CALENDAR may be had at the Office of this Paper, or of any bookseller, price 3*d.*, or 5*s.* for 25 copies for distribution amongst cottage tenantry.

ROBERTS'S STRAWBERRY TILES: *W K P.* We cannot insert statements, either for or against, unless the writers are known to us or to others whom we know. Anonymous communications are inadmissible.

STUDDING AND WIRING WALLS: *B.* Use eyed studs and galvanised wire stretched horizontally. Let the studs be built in the wall, and they should be forked at the ends to prevent the possibility of their being drawn out. They should be placed 3 feet apart in every second course of bricks. Let the wire be passed through the eyes of the studs, and screwed tightly at either end of the wall to keep it straight. Nothing but the eye of the stud should project beyond the face of the wall, and the wire should not be further from the latter than ¼ or ⅜ of an inch, just far enough from it to allow a tie to be easily passed between the wire and the wall.‡

SWEET WILLIAM: *J S.* Very curious; a cut is preparing.

VINES: *An Owner.* If by mould you mean Vine mildew, you have nothing to do except to watch its FIRST appearance in the form of small specks, and then to powder those specks with flowers of sulphur. Unless the condition of your Vine is hopeless, it will get well under this treatment.

MISC.: *R H.* We assure you that we did not review the work you name. We never review works having no relation to natural history or rural economy.—*A R.* You may move your Pinus now with safety. Winter your Pentstemon speciosum in a frame.‡—*J Abell.* Though rather late in the season, you may root-prune your Cloth of Gold Rose now. The Acacia may also be moved now. Its name cannot be ascertained without flowers. ‡

SEEDLING FLOWERS.

ANTIRRHINUMS: *R W and Z.* Pretty enough, but in their present state all too small.*

DAHLIAS: *J S.* Your purple and white "fancy" is, on the whole, a fairly formed flower; but the tips are somewhat irregular, and it is also defective in the centre. — *T M W.* Yellow tinged with brown, average size, and good in form and petal. Closely shaded it will be clear yellow. Desirable if constant.*

FUCHSIAS: *J P.* A large bold flower, but the sepals and the tube should have been pure white. They would then have formed a more striking contrast with the violet-purple corolla.*—*G W.* Judging from the flowers sent, your Fuchsia is certainly inferior to many of the light kinds now in cultivation.*—*T W L.* A good border kind.*

GLADIOLI: *J C.* All very beautiful, though perhaps somewhat wanting in brilliancy of colour.*

GLOXINIAS: *A B.* A pretty light variety, with a handsomely blotched and spotted throat.*

HEATHS: *Abergavenny.* In the way of Gellida, but hardly so good. It may, however, be worth preserving, on account of its peculiar pale green colour.

JAPAN LILIES: *T W L.* All handsome and worth cultivating.*

PANSY: *J F.* A common-place flower, which will not do for exhibition in a good stand.*

PETUNIAS: *J W E.* No. 2 is the best, but it is too small; the other is more common.* — *G R.* Shrivelled up and unexaminable.*

SALVIA: *T M W.* Not in good condition, but apparently unattractive.*

VERBENAS: *B J, H T, and W C.* Not examinable, being all too much shrivelled up.*

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

GUANO AND OTHER MANURES FOR WHEAT SOWING.—On Sale, Guano (finest Peruvian), Superphosphate of Lime, made from Bone, Bone-dust and half-inch, Dried and Prepared Night-soil, Urate, Gypsum, &c. Also Foreign and English Linseed Cake of the best quality.—Apply to MARK FOTHERGILL, 204 A, Upper Thames-street, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Clover Manure, per ton	£11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

BENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

QUEEN'S COLLEGE, CORK.

SCHOOLS OF ENGINEERING AND AGRICULTURE.

THE SESSION for 1850-51 will commence on the 15th of OCTOBER.

Prospectuses, with details of the several Courses of Lectures in connection with these Schools, the Fees payable, &c., may be obtained by application to the Registrar, or to the Professor of Engineering or Agriculture.

Boarding Houses, licensed by the President, have been established in Cork, where Students are received and comfortably provided for on moderate terms, and their religious and moral conduct watched over by the Deans of Residences.

By order of the President,

Sept. 28. FRANCIS ALBANI, Registrar.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d.*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY.

"Do you bruise the Oats you give your horses?" "No."

"Then you lose one bushel out of every three, and your cattle do not half so well."

MARY WEDLAKE AND CO.'S OAT-BRUISING MILLS. Superior Chaff Engines, simple in construction, doing from 50 to 500 bushels daily, and more. Almost all brewers and coachmasters in London use these implements.

118, Fenchurch-street, London. A pamphlet on the above, by sending 12 postage stamps. Chaff-cutters, Linseed, Bean, and Malt Mills.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 28, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS
THURSDAY, Oct. 3—Agricultural Imp. Society of Ireland.
THURSDAY, — 10—Agricultural Imp. Society of Ireland.

THERE is a great deal of mistaken benevolence which purchases an immediate good at the expense of ultimate injury. The systematic relief of distress, without reference to its cause, is an instance of this; and so is the treatment of one's "neighbour" according to his necessity rather than according to his desert. The man who would diminish pauperism in any locality, or improve the condition of the labouring class around him, is much more likely to attain his object by exerting himself for those who are still among the self-maintaining, than by striving for the relief of the dependent. And on this ground, among many others, we contend for the soundness of that judgment which approves of the ALLOTMENT SYSTEM. It is not as relief granted to the poor, but as enabling them to achieve it for themselves—it is not as any direct benefit conferred upon them, but as the means of fostering those habits of industry and economy by which they will be benefited—that the allotment system is especially praiseworthy. The owner of the land on whom we depend for its extension is not asked to exercise any self-denial, or suffer any loss that others may thus be the gainers. He will himself be a gainer along with them, receiving higher rents for his land than farming on the large scale can afford him; and his tenantry will benefit through the opportunity he thus offers them for saving that time and those means which would otherwise be wasted and probably misspent.

The following communication from "An Essex Labourer" illustrates the great importance of allotments of land to men in his station, in individual cases, but it is more particularly important, we believe, in illustration of the general subject of the relationship between master and servant. The writer says:—

"I am an old soldier, having served my country (as the usual term is) for many years; I have medals to show (granted by the present not over liberal Ministry), and I am grateful to say that I receive a pension. Yet in this consists my hardship: I have worked on a farm for 23 years, 11 in the service of its present occupier, the rest in that of his uncle, and during that period I am not aware that I ever committed myself in any way, or I should have been instantly discharged. In March last, however, my master told me that he did not want me any longer. I said 'I hope, Sir, you will not discharge me, as I have been so long on the farm;' his answer was, 'I have no fault to find with you, but I think as you have a shilling a day from Government, you can do better than many now out of employ.' This is no doubt true, yet, I think, no one can say that it is not a great hardship upon me, having as I have three children, and wishing to give them a better schooling than I myself received, as a means of helping them on in the world. It is impossible for me to do this now, as I have not been able to get more than a week's work from the time I have referred to till the present. Now I think if I could get an acre or two of land to cultivate, I should be able to rub on well, as it would fill up the time when I cannot get a job; but, in this part of the county (Essex), there is no chance unless you take it of a tenant farmer, and they charge you such an enormous rent that no one can have a chance of getting a living on it—as much as 4*l.* an acre for very poor land, and 6*l.* for a better quality. Now any one at all conversant with land must know that it will not repay a man's labour at this rent. What I wish is, that those gentlemen who have land to let would divide it into small portions, say 10, 15, or 20 or more acres; they would get more rent, after paying a person to collect it, and might have it every three months if necessary. I am certain that any gentleman who might try it would increase his quantity every year, and at the same time be conferring a great benefit on his poorer neighbours. There is one gentleman in this neighbourhood who has taken a small field from one of his farms and divided it into allotments. He might let ten times the quantity, but the tenant does not like it. *An Essex Labourer.*"

Now, supposing all the particulars bearing on the transaction here related to have been correctly stated, we believe his master to have erred in discharging from his service this "Essex Labourer." We do not know the character of the men with whom he had to compete, but in the event of having to discharge from our service a certain weekly value of labour, we certainly should feel to have acted with greater wisdom in selecting the weakest, rather than the strongest hands, for dismissal. We are entirely unacquainted with the history of this man, except in so far as our readers are also made acquainted with it by his own pen; but the case seems to furnish a good text for some general observations, and of course the above remarks are made without any personal intention. The lesson we would endeavour both to learn and to teach, for we believe it to be a just one, is to treat our men, not according to their necessity, but according to their desert. Give honour to skill, ability, trustworthiness, and labourers will strive after them; but let the necessity or helplessness of our men be the guide of their treatment, and we shall soon be surrounded by pauperism enough. The circumstance that a man's merit had been authenticated by a pension would induce us to choose him, rather than one of whose worth we could not be so sure, for any favour we had to confer. And 23 years' knowledge of his steadiness might well strengthen his claims upon our consideration. Let the best labourer have the best wages, whether he have a family or not—whether he have other means of support or not. And, just so as regards allotments, let the largest be offered to the strongest and most skilled, to the man who can have the most assistance in its cultivation from his children, to him who, living nearest the allotment ground, and having the smallest garden already, will have the most time at command. If poverty and not ability is to be our guide in allotting these small farms, they will have a pauperising rather than a strengthening tendency, as everything has which acts as a premium upon weakness or distress.

The allotment system we recommend is however something very different from that which the "Essex Labourer" himself suggests. The circumstances must be very rare which would justify any proprietor in cutting his large farms into 10, 15, or 20 acre pieces, as he proposes. It is desirable that in every locality there be farms of all sizes—that at no stage in the succession, from 10 acres to 1000, should there be an interval so wide as to be impassable by any one who has prospered on its lower side and would rise beyond it. It is desirable that the steps on the social scale be frequent enough, and therefore near enough to encourage those who would mount: but let the platform be largest at that height where it is most for the benefit of the community that the majority should be. We would furnish the amplest means for climbing from one platform to another; but this is quite another thing from reducing the levels of the platforms themselves. We would have large farms as a general rule, but we would make them accessible from the platform of the labourer; the allotment system would represent the first "round" of the ladder connecting them, and above it, in succession, should be a series of farms, in-

creasing in size, to correspond with the increasing means of the industrious and intelligent man, who alone is able to rise.

THE RESULTS OF MACHINERY.

A Village Lecture.

Doubtless, many amongst you will remember the great disturbances made a few years ago by some bands of discontented labourers, who set to work to destroy all machines used in the cultivation of the land. And why did they so act? Because, as they said, the introduction of machinery had been the means of throwing people out of employ. Knowing that some of you whom I address to-night entertain the same opinion, I am led to preface a course of lectures upon mechanics, with an essay to prove to you the incorrectness of your way of thinking. You think that machinery is a curse, while I consider it to be a blessing. Before, however, we can proceed to argue this point, we must come to understand what we each mean by a machine. Else, you taking it to mean one thing, and I another, we shall never understand each other. You may not call many implements machines which I do. Now let us examine a variety of things. Some of you have been hoeing to-day; is your hoe a machine? You all shake your heads, so I will say—No. Others have been using the spade; is that a machine? No, again. Who is it that has been ploughing and harrowing? Can we call the ploughs and harrows machines? No. The dairy-maid will make butter to-morrow; is her churn a machine? No. The forks? No. Your knives? No. The noisy implement worked by four horses and a number of men, which has been making so much dust here to-day, is that to be called a machine? Yes. You seem all agreed. And why do you call it a machine? Because it throws a great many threshers out of employ? Some nod, while others shake their heads. Because it can do more than a man can, in the same time? You are not agreed. Because it does the work so well? No. Because it is very complicated, and works by means of a great many wheels? You are undecided. Then I am to conclude that you cannot give me a reason for calling it a machine. Some more questions may help us, perhaps. We will try to find another machine. The cart? No. The dibbling-irons? No. The drill? Some yes, and others no. The flail? No. The dressing-machine? You differ. The horse churn? Again you are disagreed. Well, these questions will serve our purpose for the present. You will perhaps be surprised when I tell you that I consider all the implements mentioned to be properly called machines. You differ among yourselves as to what is a machine, and what is not. You cannot draw a line anywhere. If I say, tell me why you call an implement for threshing corn quickly a machine, and one for threshing it slowly not a machine; why a horse-churn is a machine and a common churn is not, you are confused, and say you don't know.

Now the most sensible distinction I have ever known to be drawn between the two, was made by a poor man. About 20 years ago the hand-loom weavers of Glasgow were reduced to great poverty by the introduction of machinery, which superseded their labours. An inquiry was made into the circumstances of the suffering families, and some of the weavers appeared before a committee of the House of Commons. John Foster, the first witness examined, made the following answers to the questions put to him. "*Q.* Are the committee to understand that you attribute the insufficiency of your remuneration for your labour to the introduction of machinery? *A.* Yes.—*Q.* Do you consider therefore that the introduction of machinery is objectionable? *A.* We do not. The weavers in general of Glasgow and its vicinity do not consider that machinery can or ought to be stopped or put down. They know perfectly well that machinery must go on, that it will go on, and that it is impossible to stop it. They are aware that every implement of agriculture or manufacture is a portion of machinery, and indeed everything that goes beyond the teeth and nails (if I may use the expression) is a machine. I am authorised by the majority of our society to say that I speak their minds as well as my own in stating this." Now if John Foster is right, how wrong are you! Let us talk about the threshing machine. Some call it a machine, because it throws men out of employ. So, then, is the horse a machine, for he does with the plough the work that six men would perform with spades, or with the harrow the work that the same number of men would perform with rakes. The horse displaces human labour, and is, by your reasoning, on that account a machine. More men would be employed if there were fewer horses, so that horses are great evils. Others call it a machine because it works by means of wheels. So then is the cart a machine. It displaces the labour of men, who would otherwise be used as porters for the conveyance of manure from the yard and heaps to the field. The Turnip cutter and the grindstone are also machines for the same reason. Some say that it is a machine because it threshes corn quicker and more cheaply than the flail. Then all things that work quickly and cheaply are great evils, you would have us believe, and this we know to be absurd when you are all so glad to be supplied with water by pumps in your own houses, rather than have to draw it from the well, or fetch it from a great distance. We must come to John Foster's distinction, argue as we will, and we must allow that the simplest tool is a machine, while the most perfect machine is only a complicated tool.

Will you agree with me when I say that everything that tends to displace human labour, is a machine? Yes. And you would reject all machinery as being unbeneficial to you? Yes and no. Well, for the sake of showing you to what condition you would be reduced without it, I will suppose that you all assent.

Iron has become so necessary to you, that you cannot fancy yourselves without it. Would you not consider that man mad, who proposed the abolition of all iron hoes? Yes. Well, but the use of iron hoes greatly lessens, you say, the amount of human labour. Such an act, would provide work for a greater number of men, for with crooked sticks so much land could not be hoed in a day, and therefore the more men would have to be employed. Then the spade to supersede the plough, a great deal more work would be furnished to the poor, and were we to cultivate the land with our nails and hands, all the men, women, and children in the country would find employment; and not employment, merely, but misery and starvation also. Labour in itself is not a good, it is profitable labour that benefits and raises a people. On this fact all the question hinges. To it we shall shortly return, but I wish you now to think of the subject of a lecture I delivered to you about two months ago. If you remember, I described the deplorable condition in which our ancestors the Britons were found by the Romans. How, think you, have we risen from such a miserable plight, but by learning to use the machines brought by the Romans, and by becoming acquainted with the arts of civilisation the value of which they taught us? They bored into the earth and brought up iron, and tin, and copper; they felled the Oaks of our forests, built boats, and erected houses, &c.; they showed us those vast resources of wealth, by the ingenious and economical use of which we have been transformed from an insignificant tribe to the most powerful nation of the world. The labouring people of Spain and Portugal are now in nearly as miserable a state as we were then. And why? Because they have few machines. When the Spaniards went to South America for gold, they were obliged to compel the natives to labour for them without remuneration. They could put into their hands no tools, save the spade and the pickaxe, and the work with these tools was so slow and so costly, as scarcely to fall beneath the value of the gold obtained. The ore in which gold is found would not be worth picking up, were we destitute of machines to manufacture it. Had these Spaniards made use of mining engines, and set a few smelting furnaces going, the result would have been very different, and the thousands of Mexicans who died of exhaustion at these works, might have lived to work to their own profit and that of their masters, upon the lighter processes of refining, of beating, and of drawing. The Chinese labourers are the poorest in the world for this sole reason; and the hard worked Hindoos, because they lack machines to economise time and labour, are ever employed in the most servile offices of cultivation, &c., which machines perform for us, and are so fully occupied with these that they could not, supposing that there was sufficient capital to employ them about other and more profitable work, have recourse to it. What thousands are there employed as hewers of wood and drawers of water, as bearers of palanquins and beasts of burden; in short, how many millions of hands are engaged there in operations that machines would perform for us, increasing thereby our power, and cheapening our productions. The work of producing cotton, silk, and sugar, is performed so slowly, because by human labour alone, and so expensive from the same reason, that all the capital of the country is expended in the mere growth of these materials. If India could economise human labour and money in the first operations, so as to release a part of the capital and force, to carry on the processes of manufacturing the raw material into fabric and marketable ware, what a vast source of wealth would she find laid open to her! But, as I will presently show, we have cunningly laid hold upon this means of wealth, and have thriven upon it, proving indisputably that a small community with machinery is more powerful than a mighty empire without it. The poor Hindoo still toils under a fierce sun in the Cotton fields, or plies the wheel beneath the Tamarind tree for a miserable pittance of rice, whilst we import his bales of cotton and hanks of silk to unravel and wear in England, and offer them again to him in his own market at a price which remunerates our mechanics, our manufacturers, our merchants, and our shipowners, and for which he is glad to obtain them.

You see New Zealand on the map there. The inhabitants of that country possess no machines, and are compelled to beat their corn between stones in order to convert it into meal. Would any one of you like to stop at home 80 days out of the 365, in order to beat your corn into flour?

There are many who from infancy to manhood are clothed in the produce of the loom, and surrounded by the benefits of machinery, without bestowing a thought on the sources of these benefits. I think those people who cry out against machinery are not the most consistent in the world. Let us examine the cottage of such a man. Of what is it built? The walls are of plaster. Plaster is composed of lime, and we cannot dig for chalk, which is converted into lime in the kiln, without spades and pickaxes, which are machines. It is roofed with slates. Slate is obtained by machinery from the quarry, and cut for roofing purposes into thin layers by machines. The framework of the house consists of beams and rafters and uprights, &c., all evenly cut and fitted together in a surprisingly little time, and with but a very small waste of material, but not without machines. The carpenter's rule, his hatchet, his saw, his planes—and his centre-bits, his gimlet, his bradawl, his nails, and his hammer—these are all machines, and without them would few houses be built, and those few less comfortable than the meanest hovel in our village. Let us go into the bedroom. Well now that bedstead should not be here; machines have been employed to construct it. You may be exposed to draughts on the floor, but still that must be your resting-place. What is to be your covering? certainly not blankets nor sheets, for you scorn the results of machinery. You will not object to wrap yourself in sheep-skins, for they can be your sole clothing. It is not honest to object to machinery, to say that it is a bad thing, and yet to enjoy the blessings it dispenses in this way. You must excuse me if, for the sake of your character, I turn you out of this comfortable house altogether.

You may think that I have exaggerated the case; but I assure you that I have not done so. Comfortably housed and provided as you are, it is difficult to picture so miserable a contrast. But you have only to fancy yourselves the very reverse of what you are at present. Step forth from your cottage, put off your clothes, and roam abroad; abandon the use of all iron-shod tools, of all metals, of coals; give up your roads, break down the bridges, let the horses run wild, feed upon vegetables that you can produce by the work of your hands only, together with the wild fruits of herbs and trees; thus reduce yourselves, and you may then conjecture what it is to be without machinery. One of the chiefs of the people of New Zealand, who had been supplied with tools by the English vessels, told Mr. Marsden, a missionary, "that his wooden spades were all broken, and he had not an axe to make any more; his canoes were all broken, and he had not a nail or gimlet to mend them with; his Potato grounds were uncultivated, and he had not a hoe to break them up with; and that for want of cultivation he and his people would have nothing to eat." This shows you the state of a people without machinery. *F. R. S.*

(To be continued.)

POULTRY MISCELLANIES.

5. *Deformities in Fowls.*—I have no doubt that many of the ailments amongst poultry, for which the suggestion, by the Editor, of a remedy is requested, are cases quite past all hope of aid by physic. However healthy the fleshy and intestinal parts of any creature may be, if its bony skeleton be distorted, things cannot go on right with it. If a fowl is dispirited, sulky, refusing to eat its due share, pining away with no one knows what malady, a careful handling of it, and an examination by that means of the shape of its bones, will often reveal a deformity of structure, and so save a deal of useless doctoring. It is a case for the cook, instead of the veterinary surgeon, and the sooner a decisive operation is performed the better.

a. A not uncommon mis-shape is a distortion of the two bones that lie one on each side of the back-bone, and which in carving are called the side bones; it is generally accompanied by a twisting, *upwards and downwards*, not side-wise, of the backbone itself. Now, protected by these bones, and close beneath them, lie the lungs, the kidneys, and the ovaries or egg-organs; and the healthy action of these tender and irritable parts must be disarranged by a mis-shapen back and side bones. This deformity is less frequent and less easily detected than the one next to be mentioned. It is sometimes indicated by a squatness of stature in disproportion to the size of the bird, the usual carriage of the breed to which it belongs being considered; and by passing the fingers under the feathers along the back towards the tail, the irregular depressions and swellings of the bones may be felt, if of a very decided character. I regret not having saved specimen bones of any patient of this class, in order that they might be engraved, to show clearly the malformation which it is wished to describe. I *think* I have seen this in some water birds.

b. The most usual deformity is that of the sternum or breast-bone. The keel of the breast-bone is twisted in a way which it is impossible to show without the aid of shaded drawings. To this are attached the great muscles belonging to the fore-part of the body, so that the outward as well as the inward mechanism of the creature is deranged by this deformity. I have seen the same defect in turkeys as well as in fowls, but never in water-birds, nor, that I remember, in any gallinaceous game. It is most common in late hatched birds. Bantams, the rearing of which has been deferred till the latter part of the season, in order to keep them dwarf, are apt to be thus deformed, and consequently incapable of performing all their animal functions properly. People sometimes pride themselves on having the smallest hen in the town, or in the county, which on inspection proves to be a useless unproductive curiosity, that can just be kept in life. Were an attempt made to reduce the size of any large breed by persisting in hatching them late, the chances are that half the chickens would come with distorted breast-bones. And in carving, the crooked breast-bone is more commonly met with in turkeys in March, than in Turkeys at Christmas, *i.e.*, the birds that come from the latest broods. But besides late hatching, too close confinement, and insufficient variety of food for the chickens will cause the complaint. Just as a baby fed on arrow-root, without a due supply of milk and baked flour or biscuit in its diet, will grow fat and get the "rickets!" So, if chicks have not given to them, and are not allowed to get for themselves, in their meals, the materials wherewith to make bones, they will grow

into cripples and become good for nothing, or die, in spite of the most potent remedies that Mr. Editor and his *aide-de-camp* may kindly prescribe to the unseen patient. This is why we have so repeatedly recommended the mixture of fine pollard, and even bran, which contain many of the elements of bone, with rice and other matters, that are deficient in them, as chicken food. For the same reason calcined oyster-shells, egg-shells, and all kinds of kitchen scraps are to be offered.

c. A rarer accident is the production of a cross bill. No chick so disorganised has ever been hatched under our own inspection; but this summer I saw in an aviary a living specimen of this unhappy configuration. The bird was kept alive with soft food, appearing to have a difficulty in picking up grain; and it is clear that the chances of such a creature surviving long in a wild state are very small. For it is not like the mandibles of the grosbeak, a peculiar adaptation to suit a particular purpose, but an alteration by disease of the usual adaptation of the bird's bill to its food. We should be more inclined to destroy such a miserable sufferer, than to endeavour to prolong its existence.

d. Crooked Feet and Toes.—The claws of a *rasorial* or scratching bird are not expected to be particularly taper and delicate; still, in their very coarseness there is a model form, which, if much deviated from, becomes a deformity. The feet are then unable to harrow up seeds and insects, and the creature is less competent to procure food according to its natural instincts. But the defect is obvious, and not likely to cause perplexity, like malformation of the unseen bony parts. The owner of the ugly oddity can please himself whether to kill or spare it. We have lately had hatched a chicken all whose toes turn inwards right and left on a horizontal plane, with a strong curvature. It walks and runs as well as the rest of the brood, but would be unable to tear a tough turf to pieces with its feet.

In reference to "Miscellany, 2," at p. 507, scepticism is expressed by "I. J. F." (who keeps a small number of fowls, like "A Constant Reader," and under much the same circumstances), as to the disease, with which they are similarly affected (some having a little swelling in the head, while others have a rattling noise in the throat), being curable in its early stages. He is fearful on that point, and hopes "D." will excuse his differing from him; for his fowls have been ill about two months, and are without evidence of recovery, although they have "the eye of the master" upon them. He would like to be informed whether "D.," or any other keeper of poultry, has proved that this "plague" has ever been known to be thoroughly eradicated from the yard, without destroying the whole of the stock.

Now here one might say that the remedy was worse than the disease. With a single lot of half a dozen, or half a score, it might be of no heavy consequence; but to destroy a various collection of 100 or 200 head, because a few of the number will persist in sneezing and crying "pip," seems a stroke rather too much in the style of Mohammed Ali. There is one decidedly efficacious medicine, which people who keep fowls in small confined yards (especially when surrounded by the lofty buildings of a town) cannot command, namely, sunshine—hot, dusty basking-corners for their poultry. They cannot turn the rays of the sun from their direct course, and persuade them to warm the chilly soil. So the fowls fail to thrive. But we happen to be in actual possession of fowls which have been cured, or have recovered, it is difficult to pronounce which, from the malady; and are now, as far as one can tell, in perfect health. A little "sneeze and pip" will always be hanging about a large stock of poultry, with every care. The object, of course, is to reduce it to the lowest amount. Contrary, it must be confessed, to the popular notion, we do not believe it to be infectious in the early stages; but decidedly epidemic, depending upon locality. Certain farms will have a certain various proportion of disease among their poultry, which proportion, as compared with that of other farms, is constant through a course of years, the care and degree of intelligence bestowed on each being the same. Why else should some counties have been known, for years past, as more favourable than others to the rearing of poultry? And it is remarkable that such counties should be those which lie upon the chalk, as Norfolk, Cambridgeshire, Kent, Sussex, &c. One curious point about this Protean malady, which, in its more advanced stages, is the same as that called roup in most poultry-books, is that although not infectious (according to our belief), it seems to be self-generated under special circumstances. Thus, if a lot of healthy fowls are made to join company, from a distance, with a large company of others, all in apparent good health, the chances are, that most of the new comers will have to go through a course of "sneeze and pip" till they are seasoned to their new habitation, and some of them perhaps die. Whether fowls that have made a long journey are more liable to these attacks we would not say; but certain it is that nearly every stranger has to go through the ordeal, and we can speak to the fact, after considerable experience in the reception of strange birds, with such certainty as to induce a resolve never to *lend* a valuable bird, but either to part with it entirely, or to refuse to let it go. We conceive that the effluvium of a large head of poultry, all in apparent health, may act injuriously, say infectiously, on a healthy lot of new-comers, though they themselves suffer no detriment from inhaling it. The fresh arrivals are then supposed to have brought the "sneeze and pip," though, poor things, they are the injured parties. I fear that from this cause many a fowl-dealer has been unjustly accused of sending unhealthy specimens to his customers. They have often enough sins of actual commission to answer for, without having to bear the blame of what they cannot obviate. But the first-class London dealers, such as Mr. Baily, of Mount street, on receiving an order seldom execute it from their own home stock, but procure what is wanted from correspondents, or from supplies out at walk in the country; and, doubtless, always would do so, if requested. But it would be more agreeable to write a chapter on the Health than on the Diseases of Fowls, and we do not care speedily to recur to the subject. As before stated, rue has proved the most efficacious drug in our own poultry-yard; but a dose of jalap, or a calomel and colycinth pill may also be good, as empirical alteratives, to take the chance that a change in the system of the creature may turn out an improvement. But prevention is better than cure. It is a strange superstition, the belief that, in the case either of man, beast, or bird, a something, put down the throat, should be able to remedy everything that is wrong within; whether resulting from vice, indolence, over-eating, over-drinking, starvation by hunger, cold and wet, or mere feebleness of vital force. A "Parr's Life Pill" for fowls would sell. So much less trouble to give the poor things a bolus, than to look to their cleanliness, comfort, and sufficient and equal feeding; *i. e.*, seeing that the weaklings have their share as well as the cocks and hens of the walk, four or five times a day, especially in wet weather, when such charity is most truly, and indeed welcome. *D.*

AGRICULTURAL DEFINITIONS AND EXPLANATIONS.

Agriculture is the art of cultivating the soil, and of manufacturing the produce into food for man and for beast; and into food for the crops we produce.—It includes all the operations by which we can artificially increase the natural produce of the earth: the most perfect system of agriculture being that which produces the greatest amount of free produce.—The laws of nature applicable to the art of gardening, are equally applicable to that of farming. "I cannot distinguish between an individual gardener and a national gardener; the same means will produce the same result, whether on a large or small scale. The question is, is the manual labour applied properly? if it is, the cost is of no consequence on the large scale, provided there is capital." (Mechi.)

To obtain the object of agriculture or of any other art, there must be a scientific system adopted, on certain known principles, fitted to the circumstances of the case—the particular soil, the climate, and demands of our market. A practical knowledge of all the sciences which contribute to the art of agriculture, as well as a practical knowledge of the various operations which are required to carry out the work, and a knowledge of the external influences affecting them, are necessary to the profitable prosecution of the art.

A knowledge of the chemistry, the vegetable physiology, the geology, and the mechanics of agriculture is necessary to the practice of agriculture scientifically. All our proceedings must be in unison with the laws of Nature, or they will be fruitless. To this we must add the knowledge of the proper application of labour under every circumstance in which the soil may be placed. The study of agriculture is in fact the study of Nature in all her various operations, for the farmer witnesses the operations of her laws under almost every circumstance of his annual routine of procedure.

The laws of Nature, which regulate vegetation, are immutable; under the same circumstances they present the same result. Plants grow in the same manner in the richest and in the poorest soil, although their state of luxuriance be widely different; they live on nearly the same food, and the same circumstance causes the death of all, and when dead (whatever may have been the difference of their luxuriance), they all decompose and pass into their original elements in the same manner.—Thus the laws which regulate the growth, and which cause the decay of plants, are as unchangeable as their results are certain, but there are certain circumstances under which growing plants are frequently placed, which increase or retard the progress of their growth, and which present a uniform result. These relate to the variety of the soil, and the state of the cultivation under which it is placed, and the variableness of the climate.—The circumstances under which plants grow most luxuriantly, and come to the greatest perfection, are therefore of the utmost importance, and should be studied, and always adopted; and those circumstances under which their growth is retarded, must also be studied, that they may be prevented or avoided. The advantages therefore are obvious which that farmer possesses who is acquainted with the principles regulating the various operations which belong to agriculture, and who thus has fixed principles to direct him in all his agricultural operations.—Cultivation or tillage may be defined as being the proper mechanical arrangement of the particles which compose the active soil for the production of our crops.—Matter is indestructible; we cannot create or destroy a single atom. All that we can effect in our operations is merely to change the position and relations of some of them. All active soil is composed of solid materials, these never change their nature; they are, however, converted into liquid and gaseous forms, and transferred from one body to another by mechanical and chemical force.—But all the vegetable and animal matters, which are universally found in rich and well cultivated soils are in a constant state of change, passing into their original elements. This fact should never be lost sight of; for if we do not yearly fill up this loss, which is daily going on, it is evident that the capabilities of the soil will yearly decrease.—A certain mechanical condition of the soil is necessary for every plant, to afford it support and nourishment. The soil, therefore, ought always to be in such a state of cultivation as to furnish the matter which the plants require to bring them to perfection. The rain, the dew, and the insensible humidity of the atmosphere, furnish much of the matters which plants require during their growth; hence the necessity of growing those plants which are suited to the climate and soil, and of adopting such a system of cultivation as will at all times keep the mechanical condition of the soil in such a state as will give free admission for the rain and air to the roots of the plants, that the vegetable and animal matters in the soil may be readily decomposed, and the plants may receive from out of such decomposition the matter upon which they depend for healthy growth, whether it be for the production of leaves, stem, bulbs, or seed.—The mechanical alteration of the soil enables the roots of plants to go in search of nourishment which the soil contains, which, without perfect cultivation, would be locked up within its hard solid mass. The fine fibrous roots cannot penetrate the unbroken hard earth, but if the clods be broken small they grasp them, winding round about them, and sucking out the nourishment they contain. When the soil is well and deeply cultivated, the fine silken fibrous roots ramify and extend further, and penetrate deeper into the soil in search of nourishment than when the cultivation has not been so deeply and perfectly made.—The effects produced by bringing up fresh portions of the subsoil at intervals of time, and exposing them to the action of the atmosphere, and particularly to the frost during winter, tends greatly to pulverise and enrich the soil, and by the use of the harrow after the frost, while the land is dry, we complete by art what Nature began. Land that is deeply ploughed in the autumn, if kept dry during winter, resists the drought in the summer much better than that which is not ploughed till late in the spring.—The perfect cultivation of the soil, often repeated, presents every time a fresh portion of earthy materials to the influence of the atmosphere, which enables it to absorb those gases which hasten the decomposition of the organic and inorganic matter in the soil. And by deep cultivation between the rows of our root crops we bring down the influence of the atmosphere to the bottom of the active soil, and place it in contact with all the materials of which the soil is composed, thus hastening their decomposition—the results, whether liquid or gaseous, being presented to the roots and leaves of the plant. This is most apparent when it is performed after the manure has been applied; every repeated act of cultivation then acts on the organic and inorganic matter, and decomposes them.—Every operation of the plough, cultivator, horse-hoe, drag, harrow, and roller, accelerates and increases the disintegration of mineral masses in the soil, and liberates those materials in it which supply the plants with the inorganic matter they require; by this we extend the field in depth for the roots of our crops, and expose every portion of the cultivated soil to the most powerful action of the atmosphere, which imperceptibly reduces it to minute atoms. These mechanical exposures of the soil prepare it for the chemical changes which must follow before the inorganic matter can become soluble and liquified or capable of entering into the fine spongioles of the roots of plants.—When the soil and temperature are most favourable for putrefaction, the organic and inorganic matter will be most rapidly decomposed, and most luxuriant vegetation will follow, but then the organic matter will be sooner exhausted, and the soil will sooner require to be replenished with a fresh supply of vegetable and animal matter, food for plants.—If the mineral matters of a soil be in such proportion as to keep it at all times in a state favourable for the production of good crops under a regular course of alternate husbandry, no kind or degree of cultivation will ever derange the proportion of these materials, but the quantity of vegetable and animal matter, in all their various degrees of decomposition, will be constantly changing, and these must be as certainly replaced, or the productiveness of the soil will diminish.—The quantity and state of the manure in the soil is of the utmost importance to the farmer, and the more rapidly he gets the soil to decompose the manure, for the production of his crops, the greater will be his return, if he takes all the advantage of it which he has in his power to do.—It must appear that the objects of all our acts of cultivation is to give to the soil the power of rapidly preparing and giving up the nourishment it contains to the plants, and also the means of rapidly discharging its redundant moisture. Perfectly-drained and well-cultivated soil has this power by capillary attraction; but all this depends on the state of the soil and subsoil, as well as on the quantity of decomposing organic matter in it.—The roots of the Wheat and Turnip plants have been traced to a depth of 4 and 5 feet on land that had been perfectly drained and subsoil-ploughed; this shows the advantage of deeply cultivating the soil and subsoil. By doing this to a depth of from 1 to 2 feet we double the extent of the active soil, and thus double the extent of the field for the roots to fasten on. The roots are doubled, and they send up double the quantity of nourishment to the leaves, and these, being also doubled in extent, they prepare double the sap for the production of double the return.—Liebig says: "The size of a plant is in proportion to the surface of the organs which are destined to carry food to it. A plant gains

another mouth and stomach with every new fibre of root and every new leaf. When the food of a plant is in greater abundance than its organs require for their perfect development, the superfluous nourishment is not returned to the soil, but is employed in the formation of new organs; so when the subsoil is dried to a sufficient depth, and the organs and fibrous roots have received sufficient food for the proper development of the plant, the superfluous food is employed in the formation of additional fibres, the roots grow deeper in the mellowed subsoil and receive additional food, which is appropriated by the plant."—The depth of the active soil in which the roots have to pasture, that is, from which they draw their nourishment, requires all the cultivator's ingenuity to enlarge; for we cannot extend an acre in length or in breadth, but we can extend it in depth; and if we increase the depth of the active soil to double its present depth, we double the field of pasture for the roots of our plants to go in search of nourishment. By this means alone, the roots are greatly increased in length and the leaves are greatly increased in surface, and consequently they assimilate to their nourishment a greatly increased amount of matter, upon which the plant grows. The surface of the leaves being so greatly enlarged, they have increased power of drinking in the carbonic acid and ammonia from the atmosphere which it naturally supplies; the size of the leaves of all plants show the marked difference between a luxuriant and a sickly and poverty-stricken plant; this increased growth of the leaves produces a corresponding growth of the roots and the seed.—The roots of plants must have the power of extending and ramifying themselves in every direction in the soil, to enable the plant to extend its stem and leaves in the air. The soil must therefore be either naturally or artificially prepared "to drink in the rain of Heaven," and then if we get the rain and the dew, and the "clear shining of the sun after the rain," we may calculate on the most productive crops. —Now, as we find that a regular and sufficient supply of sap to the roots and leaves of plants is absolutely necessary to their healthy development, and as the rain from Heaven gives this vigorous growth which is so much desired, and as we have no control or influence over the clouds to cause them to drop down their richness, or, when the earth has enough, to make them withhold for a season, we must look to the proper cultivation of the soil as the only means within our reach of imbibing moisture from the atmosphere and storing up a supply to be used in times of drought, and we must also prepare the soil, by perfect drainage and deep cultivation, to part with the moisture when it comes in too great abundance. *J. M.*

Home Correspondence.

Covered Dung Heaps.—It is with much satisfaction I have perceived that a correspondent has come forward in your last Paper to bear his testimony in behalf of the advantages of keeping farm-yard dung under cover, and that he is enabled to support his arguments by the weight of practical experience. Having advocated the advantages of the practice in an essay lately published in the "Journal of the Royal Agricultural Society of England," it was with feelings almost akin to dismay, that I found that the practice was condemned by one of the judges of the "Essays on Farm Buildings," in the same Journal in which the essays appeared. The importance of the subject induces me again to allude to it; but in so doing it is far from my intention to say one word in disparagement of the very able and excellent essay which succeeded in obtaining the prize, or in the slightest degree to impugn the decision of the judges, whose practical experience, scientific acquirements, and unimpeachable integrity, I cheerfully and freely acknowledge. Believing, however, that what is right in principle cannot be wrong in practice, my opinion as to the advantages of keeping dung under cover, is not in the slightest degree altered by the opinion of so high an authority as Mr. Thompson, whose objections to the practice appear to be founded on certain inconveniences which he has found to attend it. I conceive that as compared with the advantages of the plan, the objections he has named are trivial and easily obviated. The dung when removed to the dung-heap, may be evenly spread and well saturated with the urine of the cattle collected in the neighbouring tank; and compression may be very economically secured by means of a number of store pigs, which may have access to the dung-heap from small yards, or feeding places closely adjoining. The advantages of box-feeding, I take it, are principally owing to the admirable manner in which the dung is preserved under cover, and undiluted by rain; and when we bear in mind the fact, that in some counties of England double the rain falls as does in others, and that in some seasons we have an excess of moisture, and in others a deficiency;* it surely cannot be contended that it is perfectly right to expose such a valuable article as farm-yard dung to such constant vicissitudes, so that a ton of dung shall at one time contain 90 per cent. of water, and at others scarcely 60. One of the advantages of high-feeding with cake or corn is, to enrich the dung in its most valuable constituents, to render it more concentrated, in fact; and it is this want of concentration which is the principal fault of ordinary farm-yard dung, and which renders its removal to the field so laborious and expensive. If, therefore, it is right to concentrate our dung as much as possible by high feeding, it surely cannot be correct to dilute it again by means of water. We estimate the value of good dung too highly to pursue the Augean method of cleaning our stables by turning a river through them; why then should we advocate the kindred practice of exposing them to be washed, and burdened, and diluted by the rains of heaven? Let us reflect, for a moment, on the amount of this useless water thus added to the dung-heap. The latter, *e. g.* only 56 feet by 20 (no more than half that usually found) will receive, during three wet months of the year, no less than 5973 gallons of water, or 24 tons in weight, which is required to be thrown into a cart by manual, and carted to the field by horse labour. Estimating this at 1*s.* 6*d.* per ton, we have the sum of 36*s.*, which repeated three times a year amounts to upwards of 5*l.*; the cost of labour alone in removing this annual deposition of 72 tons of water from the place where it ought not to be, to the place where it is not wanted. But perhaps it may be urged, that although 72 tons of rain water may have fallen on the dung-heap, yet this quantity is not found when the dung is removed. If so, so much the worse! What has become of it? Either it has been washed out below, and with it much of the soluble portion of the manure, or it has disappeared above by evaporation, carrying with, it into the atmosphere, a great portion of that costly ammonia which Professor Way estimates at 6*d.* per lb. And here, although we have been bold enough to calculate the cost of loading and carting to the field the rain water, supposing it to have remained in *statu quo*, our arithmetical powers sink under the task of computing the vast amount of loss sustained by our dung-heaps from the escape of ammonia, caused by excess of moisture. This, however, we may safely assert, that there is no reasonable amount of cost to be incurred in covering in a dung-heap, the interest of which sum will not be greatly exceeded by the amount of loss arising from the escape of the most valuable portions of manure; and with this assertion we must conclude. *W. C. Spooner.*

* In the months from April to October inclusive, we had double the rain in 1846, that we had in the following year.

Harvest in Eskdale, Dumfries-shire, is now pretty well over; upon some farms, all is in the stackyard. Crops have not turned out as they promised, in the beginning of August. Barley is a full average; Oats have turned out light, upon all inferior soils; Turnips which looked splendid a month ago, have, for 10 days past, stood still, and assumed an unhealthy brown appearance, as if suffering from drought. In many places, "finger and toe" is prevailing to a great extent; a friend of mine has 50 acres, where there is scarcely a sound Turnip. Potatoes looked well up to the middle of August, when the unmistakeable black blotches appeared upon the leaves, accompanied with the peculiar smell of former years. The shaws are now almost completely black; but this was assisted by a frost on the night of the 22d ult. The tubers are much diseased in some localities, and but to a limited degree in others; but there is disease, more or less, everywhere. The extent will not be known, till "raising" time. The crops in this district being comparatively late—suffered little or nothing from the shake-wind, which did so much damage on the 19th and 20th of August. The weather, for the last fortnight, has been all a farmer could desire —finer, at this season, is not recollected by that important personage, the oldest inhabitant. *J. L.*

Long Dung or short Dung.—In your Number for August 24 I presumed so far as to assert that "dung-pits, which receive the undiluted urinary drainage of the stables, yield the richest manure ever at the farmer's command;" and, in an adjoining column of the same page, I found my opinion fully corroborated by that of Dr. Anderson, the chemist of the Highland Society. But we have now the old notion revived, of the superiority of long dung for clay land, by Mr. George Summers. Now, it is well known that "unfermented dung" cannot contribute food to the plant, and is so far worthless. Among the conditions of fermentation are heat and moisture. In undrained wet clay lands the latter is abundant, and the common temperature of the atmosphere supplies the other, although but slowly. There the "unfermented" passes slowly through its several stages of decomposition, where the fermented or short dung disappears altogether at an early stage, aided by the water of the tenacious supersaturated clay; in fact, it had arrived at an advanced stage of decomposition when used. We will now take a slight glance at the composition of the two, in relation to the requirements of the crop. The "long dung" can yield but little more than carbonaceous and an insignificant proportional of inorganic matter; whereas the short dung from the pit, to which I have already alluded, is, in addition, fully charged with phosphates and ammoniacal salts, derived mainly from the undiluted urine, and which salts are recognised as among the most valuable parts of any manure, be its name or nature whatever it may; and, I may add, by which its value to the farmer is estimated. Of these valuable fertilising salts, "long dung" has, comparatively speaking, none, nor does it acquire any by being "turned" over with earth until it becomes "short." The beneficial effects of long dung are confined, chemically, to the slow evolution of carbonic acid gas to the roots, and, mechanically, whenever ploughed in the direction of the inclination of the ground, and thus clumsily helps to do what tiles would accomplish ten thousand times better. To the wet tenacious clay-land farmer I would respectfully say, use drain-tiles well, and leave the long dung in the urinous pit to increase in richness, so that you in turn may become rich. *W. E. Gill, Truro.*

Frequent v. *distant Draining.*—In Mr. Mechi's book of "Letters on Agricultural Improvement," the motto on the title page is, "We must never forget that accurate and multiplied quantitative facts form the only substantial basis of science;" and as the basis of his own science of draining, he quotes the following incontrovertible facts, astounding, but certain, because based on well substantiated experience. "That the deeper the drainage the better the crops; and the earth over the drains must never be less than 18 inches. That drains 4 feet deep, and 30 feet apart, will drain land effectually and permanently, even the heaviest soils, of the utmost quantity of surface water. The deeper the drain, even in the strongest soils, the quicker the water escapes. That deep and distant drains are by far the most profitable." A doubt may be hazarded, that Mr. Mechi has not collected a sufficient number of quantitative facts to establish these and similar points as incontrovertible in draining. In many cases of very retentive clays, water will stand as if there were no drain below it, in a quantity of earth of 18 inches. This fact is of daily occurrence. Deep drains require a porosity in the subsoil, to take the water from the surface, and convey it to the drain. In many clays, any cavity will not draw water above 1 foot from the edge; and soils are known, where a distance of the drains at 5 and even 4 yards will not drain the intervening space, owing to the imperviousness of the subsoil. Deep and distant draining has hitherto been useful in showing the necessity of placing a drain between the wide locations as speedily as possible. In all purely clay soils, the drains cannot be too shallow, provided they are not disturbed. This is the opinion and practice of the Duke of Portland, who has the drains placed in the furrows, and the ridges of the land are carefully kept in that position. And after all that has been said and written about draining, this method yet stands high, as the gathering of the ridges forms a convexity which throws the water to the drains. The advocates of deep and distant drainage have never met with clays sufficiently viscous and retentive to convince them that water will not percolate to the distant drains, and that the distance of 30 feet is totally useless. The point for consideration is, how is the water to get into the drains? to which the very obvious answer is, by frequency of the positions, and a shallow access on the top. Water must be removed from wet lands as speedily as possible; and not by a slow, filtering process, but by a rapid evacuation. The late Mr. Smith, of Deanston, told the writer of this article, in private conversation, that he had fixed 30 inches as the average depth of general drainage, and that he had never seen reason to alter his opinion. The frequency may be varied from 12 to 24 feet according to the wetness of the land, and the climate. Mr. Mechi and his adherents would experience a total failure with intervals of 30 feet on very wet and viscous clays, and on the moorband subsoils of concreted clay, sand, and gravel, which are wholly impervious to water, and over which the cultivable stratum is very shallow, with the water floating between the hard and soft depositions. This circumstance requires the top of the drains to be level as possible with the surface of the subsoil; over which the water floats and wanders, in order to be intercepted. These soils are of the most difficult drainage. *J. D.*

Cultivation of Land.—Instead of giving decided rules for the tillage of all descriptions of land, would it not be better for individuals to state their experience in various localities? pointing out the nature of the soil, and the average weather at the period of sowing and planting. Draining clay soils, and the destruction of weeds under all circumstances, may be considered necessary to good farming, as well as keeping roads in repair, and trimming hedges; but as to any arbitrary system of cropping, as fitted for peculiar lands, it appears rather a dangerous attempt to guide men, without an acquaintance with their wants and capabilities. For instance, clay soils differ so materially, that it seems quite impossible to give instructions for the cultivation of one description that will suit every other. The treatment of stiff clay with a sour blue subsoil, must be handled in a manner, and greater expense entered into, than would be required were the under stratum composed of more convertible materials, for the growth of vegetation. Even the same quality of land under a dry or a moist climate, must have different management. Again as to the three, four, or five-course plan, much must depend upon the capital of the farmer, and his oportunities of making a yard full of manure; with a plentiful heap of plant food, green and grain crops may succeed each other; dressing the soil for the former only, and thus giving half the arable part of the farm muck every year, which must of course be rich stuff. The collection of manure and its judicious application are most important on the one hand, not to permit the land to become impoverished, and on the other not to give it a surfeit, which is quite possible; carting a quantity on to last three, instead of two years, to save trouble, had better be avoided—the first crops absorbing more than is necessary for their perfect condition, and the third going without, and exhausting the land at the same time. In farming, as in other trades, a man may be "penny wise and pound foolish." Grudging labour where the liberal employment of hands would send corn to the mill, and save it another time, a great outlay with small profit. I do not wish to lay down the law, although I may seem so inclined; my principal object in occasionally troubling the *Gazette*, is to promote discussion, and obtain hints from individuals who are more competent to teach them, than I can possibly be. I am content that the little my brain contains

may benefit the public, provided I can pick something out of the heads of others. *Falcon.*

Waggons v. *Carts in the Harvest Field.*—[The following letters are from the *Stamford Mercury.*] (1). I beg to hand you below the particulars of a match tried to-day, in consequence of a challenge made by Sir John Thorold, at the last meeting of the Grantham Agricultural Association. The trial was made in a 20-acre field of shorn Wheat, occupied by Mr. Fisher, in the parish of Barkston. The distance from the stack to the gate is half a mile, and to the further side of the field nearly three quarters of a mile. The field lies on the side of a hill, and is pretty steep; and all the loads, when full, were drawn upwards. The stack-yard, also, is the most steep and awkward one to be found in the neighbourhood. The field was fairly divided, and the men and boys were equal on both sides. The number of carts and of waggons used on either side was four, and the horses used in the waggons were seven, while those in the carts were four. Each party had a separate stack, and the two parties commenced at once. The result was that the whole field was cleared in two hours and 28 minutes; and that when the cart party had cleared their half of the field, the waggon party had still two loads to take out. *Cors. Lundie, Agent for Sir John Thorold.*—(2). The above match having been made in an unusual manner (the drivers having been allowed to trot their horses whenever they could), and having been accomplished in so short a time that a number of persons desirous of seeing the carts at work came too late, it was arranged that the same parties (viz., Sir John Thorold and Mr. Fisher) should try the thing again at the ordinary rate of driving. The trial was accordingly made to-day, in a field of mown Oats on Mr. Fisher's farm. The extent of the ground cleared is 12 acres; the crop was a heavy one, and the distance from the stack-yard is a mile and a quarter. On the way the river Witham is crossed by a ford, and the approaches on either side are steep and almost frightful. As in the former case, the men and boys were equal on both sides, and the number of waggons and of carts on either side was five. The horses used in the carts were five, while those used in the waggons were ten. The time occupied in clearing the ground was 4¾ hours. Both parties began and finished together, and it was found, by measurement of the stacks, that the carts had conveyed about two loads more than the waggons. The trial of last week proved favourable to carts on level and up-hill ground, while this day's result is equally favourable for both up-hill and down. In going down to the river, it was found necessary to lock a wheel of the waggons, and to arrange the horses so as to allow of an additional leader in going up; while the carts went straight on without stop or change of circumstances. The results of these trials are believed to be more favourable to carts than any of the many experiments whereof accounts have been published from time to time in various parts of England. The reasons of this are believed to be, first, that, in most cases, the competitions were in effect rather between men than horses, whereas in the present cases the men were on both sides ample in number, skill, strength, and will, and the carriages were kept in constant motion, rarely having to wait more than a few minutes for a loader; and, secondly, that the carts used in many cases, though "Scots," have not been of the best form. The carts employed here are of the construction most approved in Berwickshire, and are as nearly as possible of the form represented in plate 12 of the "Rural Cyclopædia." *Cors. Lundie, Suston, near Grantham, Aug.* 27. P.S. Mr. Fisher and all his men began these trials with a conviction that waggons were the better, and a determination to prove them so.

Fresh and Fermented Dung.—Some short time ago, during a discussion in the Farmers' Club House, Bridge-street, Blackfriars, on the subject of farm-yard dung, Mr. Mechi observed that the days of dung-heaps were being numbered, by which he meant that farm-yard dung would be used fresh, and not subjected to the fermentative process, by being laid in heaps. This observation drew from the audience the answer of "monstrous" several times repeated, but experience shows that there is no monstrosity in the matter. During my own varied and extensive practice several occasions happened to confirm very fully the observation that was made by Mr. Mechi. A heap of dung having failed to cover a field of summer fallow for Wheat in the autumn, a quantity of very strawy dung was brought from the cattle yard, where it was made by the horses and some young beasts that were fed with Vetches. It was spread on the land and ploughed in with one furrow, which failed to cover the dung, owing to the strawy bulk of the materials. It lay in this very unsightly condition during the six weeks of harvest, when the straw was considerably decomposed and covered by the seed furrows of the ground. When the seed was harrowed into the ground, the finishing process was still unsightly, and much of the dung lay above ground, in a seemingly half-decomposed condition. By the month of March the remains were still very visible, and the Grass seed harrows in April had the business of finally separating the materials of the dung. Very soon after that process, a most evident superiority appeared in the Wheat crop on the portion of land thus treated—the braird matted thick and close to the ground, a sure sign of superiority, and the plants assumed and maintained a more vigorous green colour throughout the summer, and the crop ripened earlier than the field, and produced a greater return, which was distinctly visible. This fact showed the uselessness of dung being fermented; and also suggests that the farm-yard dung, usually laid on the fallow lands in autumn, should be spread as a top-dressing in March on the young Wheat plants. After lying for a time, it should be harrowed well over the surface, to prepare for the Grass seeds, which will thus receive an excellent bed of finely-pulverised materials. Moveable railways will convey the dung to the land in March by means of light iron waggons. The sowing of Turnips showed the same results, in the case of fresh dung from the door of the cowshed, with very little straw intermixed, being laid in the usual quantity in the hollows of the drills, and covered by the plough, and the seed sown over it. The crop of Turnips was superior, by 50 per cent., to heated bones and fermented dung in the usual quantity, and on the same field of land, where soil showed no difference of quality. And the straw being cut for litter, in the length of 2 or 3 inches, would not cause any inconvenience to being covered in the land. These facts corroborate Mr. Mechi's observation; and a friend in East Lothian writes me, that farm-yard dung has been carried from the yard to the field that has been drilled for Beans, in the depth of winter, and laid in small heaps or spread along the drills, and lay there for months, exposed to every change of weather—washed by the winter's rain and snow, bleached by the frost, and dried by the strong winds; yet excellent crops are grown under this system, and that too at an elevated point of cultivation; and, in the low districts of the country, the crops in that way were better than those in the usual way. This is no dare-devil experiment, but the success of several years' practice; and, however it may clash with the doctrines of chemistry, facts are stubborn things. *J. D.*

Permanent Pasture.—On laying down land to permanent pasture there is a prevalence of the Lolium perenne on Rye-grass during the first year; this is accounted for in its being a less durable plant, as it is the nature of Grasses that some being more permanently inclined will not run to Bent till the second year, others require the soil to contain particular nutritive qualities, gained by rest from culture; all are fickle in vegetating if weather and culture do not suit them. With respect to the Lolium perenne running to Bent the first year, it is not to be wondered at, as in the common culture of Saintfoin we add Trefoil, because it would not be sufficiently made up at the first year; on the other hand, the fast growing Italian Rye-grass may be sown in the autumn for a fair crop on the following year: regarding man, he requires 20 years to come to maturity, but it is not unproportionate to the age he arrives at; on the other hand, the fly lives but for a few hours. This all tends to prove the order and similarity of Nature in everything, and that one species of Grass takes a longer time to arrive at its maturity than another. The nicety in forming a mixture of Grasses is, to have sorts not only adapted to the soil to yield a fair crop for the first year, without injuring those which do not run to Bent, but to form a succession of herbage to create fat and health. Some persons sow Lolium perenne alone, and allow it to remain for years, trusting that Nature (without man's aid) will supply the Grasses required. Plants will come to suit the land (but not to suit him), unless he exerts himself. Grasses are gregarious, the Rye-grass especially takes very little nourishment from the land at periods of the year, and unless the mixture be such as to allow one Grass to closely succeed another, the natural products of the soil will spring up. To obtain our object, an unusual degree of cleanliness and pulverisation of the soil is required. It is difficult to extirpate weeds if they spring up with the Grasses. Good rotten dung or decayed vegetable mould is required as a substitute for old turf earth; Grass seed should be very slightly covered with earth, as you may have observed at every ploughing of the land, vegetation is produced; in wet seasons the seed being washed in by the rain is sufficient. *Henry Roger Smithe, Eastling, Faversham, Kent.*

Clover Failure.—Having observed that the Clover crop in an 8 acre field was not growing so well as it usually does, I examined the plants, and found that nearly every leaf over the whole field was drilled full of holes by some insects. I accordingly directed some persons to examine it at different times during the day, and discover the cause. Yesterday morning, before breakfast, they brought me two plants, each having six or eight slugs on it, which were busy at their destructive work. Can you recommend what is best to be done under these circumstances? *J. H. S.* [Sow slaked quicklime in some moonlight night, when the slugs are out.]

Drains Down Hill.—The question whether to lay drains down the slope, or across the slope, is still in dispute. May not the conflicting opinions of the two parties be reconciled, by making a distinction commonly not adverted to between two very different cases. 1. The first case is, when clay-land is to be drained, for the purpose of carrying off the rain-water that falls on its own surface only. 2. The second case is when land is to be cleared of the water rising from below, which is derived from the rain falling on lands of higher level. In the first mentioned case, I apprehend experience has shown, that to drain down the slope is most effectual; but in the second case, on the contrary, has not the old plan of draining across the slope been proved to be preferable? *S. S.*

Notices to Correspondents.

BUCKWHEAT: *Inquirer.* It is in seed and in flower and in bud at its harvest time. You must just choose that time when the first appears to be a maximum.—We should be inclined to apply guano as a top-dressing to the *Wheat.*

FLOORING: *J H S.* Your question has been sent to one who has erected such sheds.

FOOD FOR PIGS: *P A.* We should prefer Tares, Clover, or Trifolium incarnatum to Rye-grass as food for pigs. The Rye-grass should not be sown later than early in September.

HAY-MAKING MACHINES: *P T O.* Mrs. Wedlake, of Romford, makes them, we believe, of first-rate construction.

ITALIAN RYE-GRASS: *W R* You had better not sow Italian Rye-grass now; wait till spring. About green crop rotation see an Essay in the last Number of the Royal English Agricultural Society's Journal, on increasing our supplies of animal food. If you have it not, send us your address.

LAND DRAINAGE COMPANY: *S P.* We have not by us their prospectus; and if they wish to be known they should advertise.

LIAS CLAY: *B B.* It is very calcareous; and its fertilising powers when burned may be owing partly to its containing caustic lime, and partly to the circumstance that burned clay possesses the power of concentrating within itself ammonia and other gases, of fertilising tendency. It pays well to burn the clods on clay land. Stiffe burning is the most economical system.

MANGOLD WURZEL LEAVES: *G W.* Bury them in a pit, the bottom of which admits of drainage, and mix common salt with them in the proportion of 2 lbs. of salt to 1 cwt. of leaves. "By this process Mr. Huxtable has kept them for 2½ years, at the lapse of which time they were eaten with avidity by cows, sheep, and pigs."

MOODY'S TURNIP CRUSHER: *An Old Subscriber.* It is a sparred iron framework of an inverted conical shape. The roots are thrown in and forced or grated through, by a sort of revolving piston, which catches them between it and the bars of the framework. Mr. Moody, of Shaftesbury, Wiltshire.

MR. WILKINS' DRILL; *F A S.* If "F A S." will pay for the making one, I will superintend the making. I think the expense would be about 20*l*; but I could make one for 10*l*., if I fitted it to the carriage of another drill, which I could do. You understand it puts in guano at the same time with the seed, or either separately; but if both are put in together, I put each in in separate rows, thus, corn, guano, corn, guano, corn, guano; or guano between each row of seed. This my drill will do; or it will put both in in one row together, as you please. Two seeds cannot, unless I wish it, be deposited in the same place; the seed drop one by one; but of course I could drop 1, 10, or 100. So that with the same accuracy I can put in as little as a pint an acre, or as much as a coomb. In 5 minutes also it is the best horse-hoe I ever saw. *G. Wilkins.*

OILCAKES: *A B* says—"In the analysis of the various sorts of oilcake, by Mr. Way, in the Journal of the Royal Agricultural Society, he comes to the conclusion that English cake contains more oil in it than the American. I think he is in error. The American oilcake is dry and friable (some is hard), and never fungates (to coin a word); the English cake kept under like circumstances soon is covered with fungi. This must arise from water—moisture—not from the presence of oil."

PROFESSOR WAY'S PAPER: *Member of the Roy. Ag. Soc.* We will publish extracts. We cannot assist you in your search for second-hand copies of the Journal.

PIGEON DEALERS: *X X X.* Messrs. Bailey, of Mount-street, Grosvenor-square, London; and Baker, who advertises in our columns.

SUPERPHOSPHATE: *Inquirer* had better postpone the application till February.

TO TETHER COWS: *G W* says—"There is no better collar for te hering cows than a stout leather strap and buckle, like a simple dog collar."

TURNIP SEED: *P T O.* We are not aware that it is necessary to the excellence of the seed that the plants from which it was saved should have been transplanted.

Markets.

COVENT GARDEN, SEPT. 28.

Vegetables are abundantly supplied. Hothouse Grapes and Pine-apples are plentiful, more especially the former. Peaches and Nectarines are less abundant. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent in great abundance. Filberts are dearer. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are good and cheap. Lettuces and other salading are sufficient for the demand. Mushrooms are scarcer, as are also French Beans. Cut Flowers consist of Heaths, Pelargoniums, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosissima, Japan Lilies, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Apples, dessert, p. bush, 4s to 8s
Grapes, hothouse, p. lb., 2s to 5s	— kitchen, do., 1s 6d to 3s 6d
— Portugal, p. lb., 8d to 1s	Lemons, per doz., 1s to 2s
Peaches, per doz., 1s 6d to 6s	Oranges, per doz., 2s to 3s
Nectarines, p. doz., 1s 6d to 4s	— per 100, 8s to 24s
Apricots, per doz., 1s 6d to 5s	Almonds, per peck, 6s
Figs, per punnet, 2s to 4s	— sweet, per lb., 2s to 3s
Melons, each, 1s to 3s	Walnuts, p. 100, 1s to 2s
Plums, p. punnet, 1s to 1s 6d	— p. bush., 12s to 24s
Green-gages, do., 1s to 2s	Nuts, Barcelona, p. bsh, 20s to 22s
— per sieve, 8s to 10s	— Brazil, p. bsh., 12s to 14s
Pears, per doz., 1s to 3s	Filberts, per 100 lbs., 40s to 50s

VEGETABLES.

French Beans, p. sieve, 3s to 4s	Garlic, per lb., 4d to 8d
Cabbages, per doz., 6d to 1s	Artichokes, p. doz., 2s to 4s
Greens, p. doz. bunches, 3s to 4s	Vegetable Marrows, per doz., 6d to 1s 6d
Cauliflowers, p. doz., 2s to 4s	Lettuce, Cab., p. sc., 1s to 1s 6d
Sorrel, p. hf. sieve, 6d to 9d	— Cos, p. score, 6d to 1s 6d
Potatoes, per ton, 50s to 80s	Endive, per score, 1s to 1s 6d
— per cwt., 2s 6d to 4s	Small Salads, p. punn, 2d to 3d
— per bush., 1s 6d to 2s 6d	Horse Radish, p. bdl., 1s to 4s
Turnips, p. 12 bun., 2s 6d to 3s 6d	Mushrooms, p. pot., 1s 6d to 2s 6d
Red Beet, per doz., 1s to 2s	— per bushel, 5s to 7s
Cucumbers, p. doz., 1s to 6s	Fennel, per bunch, 2d to 3d
Leeks, per bunch, 1d to 2d	Savory, per bunch, 2d to 3d
Celery, p. bundle, 1s to 1s 6d	Thyme, per bunch, 2d to 3d
Carrots, per doz., 3s to 5s	Parsley, p. doz. bun., 1s to 2s
Tomatoes, p. punnet, 1s to 1s 6d	— Roots, p. bdle., 9d to 1s
Spinach, p. half sieve, 1s 6d to 3s	Marjoram, per bunch, 2d to 4d
Onions, p. bunch, 2d to 6d	Mint, green, per bunch, 2d
— Spanish, p. doz., 1s 6d to 4s	Watercress, p. 12 bunch., 6d to 9d
Shallots, per lb., 6d to 8d	

SMITHFIELD, MONDAY, Sept. 23.

The number of Beasts is again large, and the average quality is still very indifferent; consequently the choicest are disposed of, but inferior kinds are scarcely saleable. Although the supply of Sheep is not excessive, the demand is so small they cannot all be sold, notwithstanding a reduction is submitted to. There is more demand for a choice Calf, but trade generally is bad. The foreign supply consists of 1267 Beasts, 4570 Sheep, 205 Calves, and 10 Pigs.

Per st. of 8 lbs.—	s	d		s	d
Best Scots, Herefords, &c.	3	4	to 3	6	
Best Short-horns	3	0	— 3	4	
2d quality Beasts	2	4	— 2	10	
Best Downs and Half-oreds	3	8	— 3	10	
Ditto Shorn	...	...	—	...

Ditto Shorn	...	...	—	...	
Ewes & 2d quality	2	8	— 3	2	
Ditto Shorn	...	...	—	...	
Lambs	...	...	—	...	
Calves	...	...	2	4 — 3	6
Pigs	...	...	3	4 — 4	0

Beasts, 4872; Sheep and Lambs, 29,810; Calves, 281; Pigs, 550.

FRIDAY, Sept. 27.

The supply of Beasts is large; it chiefly consists of foreigners and those left from Monday. Choice qualities being scarce

meet with a very ready sale; but trade is exceedingly bad for all other kinds. Sheep are plentiful for the time of year. There is more inquiry for the best descriptions, but on the average trade is no better. There is very little trade for Calves, and 3s. 4d. is an extreme quotation. From Holland and Germany there are 508 Beasts, 2150 Sheep, 234 Calves, and 20 Pigs; 200 Beasts from the midland counties; and 87 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3	4 to 3 6	Best Long-wools	3	4 to 3 6
Best Short-horns	3	0 — 3 4	Ditto Shorn	...	— ..
2d quality Beasts	2	4 — 2 10	Ewes & 2d quality	2	8 — 3 2
Best Downs and Half-breds	3	8 — 3 10	Ditto Shorn	...	— ...
Ditto Shorn	...	... — ...	Lambs	...	— ...
			Calves	2	4 — 3 4
			Pigs	3	4 — 4 0

Beasts, 1026; Sheep and Lambs. 7360; Calves, 502; Pigs, 510.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, Sept. 26.

COAL MARKET.—Friday, Sept. 27.

Ravepsworth West Hartley, 15s. 6d.; Wallsend Riddell, 16s.; Wallsend Hetton, 17s.; Wallsend Bewick, 16s.; Wallsend Lambton, 16s. 9d.—Ships at market, 30.

HOPS.—Friday, Sept. 27.

Messrs. Pattenden and Smith report that the demand for new Hops continues very brisk at full prices. Duty, 210,000*l.*

MARK LANE.

Monday, Sept. 23.—The supply of Wheat by land carriage samples from Essex this morning was moderate, but large from Kent; the best qualities were realised at fully last week's prices, but the secondary and those of inferior condition met a slow sale. Foreign was in rather improved but retail demand, and our quotations continue to be fully supported.—Malting Barley is unaltered in value; grinding is the turn cheaper.—Beans are quite as dear as on this day se'nnight.—White Peas must be written 1s. per qr. cheaper; other sorts maintain last week's prices.—The arrival of Oats being considerable, all descriptions must be written 6d. per qr. lower.—Full prices are asked for Flour, but the sale is not brisk.

Friday, Sept. 27.—Excepting foreign Wheat, of which the supply is good, the arrivals of grain this week have been small. This morning's market was thinly attended, and for the samples of English Wheat left over from Monday, that day's prices are unobtainable. Foreign was neglected, and prices must be considered nominal. Barley is a heavy sale at Monday's prices. Beans and Peas unaltered in value. Oats are in improved demand, and the turn in favour of the seller. The Flour market is heavy; Norfolk and American is 6d. to 1s. cheaper. During the week a large business has been done in floating cargoes of Wheat and Maize from the Mediterranean for Ireland.

Liverpool, Friday, Sept. 20.—A fair quantity of Wheat and Flour from foreign ports has arrived during the last three days, but from our own coasts the importation has been very light of any article of the grain trade. At this morning's market there was a large display of samples of Wheat and Flour, and having only a moderate demand, prices were the turn in favour of buyers. The market is at present very bare of good mealing Oats. Barley, Beans, and Peas each brought extreme rates, with a steady healthy demand for feeding purposes. Indian Corn continues to be held firmly, at 28s. per 480 lbs. for the best American yellow, but there is very little passing in the article this morning.——Tuesday, Sept. 24.—We have to note a further very abundent import of Wheat from the Baltic, the near Continental ports, including France and the south of Europe, with equally large arrivals of States, Canadian, and French Flour. The pressure of these extraordinary importations of Wheat and Flour, added to the heavy arrivals of last week, has not produced that serious impression upon the trade which was anticipated at our market to-day, the decline in English and Irish new Wheats not exceeding 2d., and the general qualities of foreign merely 1d. per 70 lbs. from the rates of Tuesday last. Malting Barley and Malt may be noted 1s. per qr. lower. Beans remain steady in value. Peas advanced 1s. per qr. Oats move slowly, on late terms. The trade closed firmly at the currency of this day se'nnight. Wheat, English red, per 70 lbs., 5s. 8d. to 6s. 2d.; white, 6s. 0d. to 6s. 5d. Barley, Scotch and Irish, per 60 lbs., 2s. 10d. to 3s. 2d. Malt, English, per qr. pale, 48s. to 53s. Oats, English and Scotch, per 45 lbs., 2s. 9d. to 3s. 0d. Beans, English, per qr., 28s. to 32s. Peas, do. do., 31s. to 33s.

Re-issue, Part I., on First October, to be continued Monthly.

In Parts, 2s. 6d. each, Super Royal 8vo.

A

CYCLOPEDIA OF AGRICULTURE,

PRACTICAL AND SCIENTIFIC;

IN WHICH

THE THEORY, THE ART, AND THE BUSINESS OF FARMING,

IN ALL THEIR DEPARTMENTS, ARE THOROUGHLY AND PRACTICALLY TREATED.

BY UPWARDS OF FIFTY OF THE MOST EMINENT FARMERS, LAND AGENTS, AND SCIENTIFIC MEN OF THE DAY.

EDITED BY JOHN C. MORTON,

EDITOR OF 'THE AGRICULTURAL GAZETTE.'

With above One Thousand Illustrations on Wood and Steel.

The object of this Work is to present to the Agricultural Reader the whole of the truth immediately connected with his profession, so far as it is known to the men most familiar with the sciences it involves, the methods it employs, and the risks it incurs. For this purpose, every topic requiring discussion has been placed in the hands of those with whom it has been a matter of personal experience and study.

Agriculture is so extensive a subject, that no one writer can speak from personal knowledge on all its departments; and it is a subject so variable with circumstances, and therefore so liable to misrepresentation, that no other kind of knowledge is worth communicating. Many previous attempts have been made to condense in one Work all existing information on Agricultural affairs; but the Authors, or Editors, however skilful in recording their own experience, and however successful there, have never had equal success in conveying the experience of others. The Agriculturist, in daily contact with Nature, requires the assistance of those who have had personal acquaintance with her laws and requirements; writers retailing an experience at second hand upon these points, can neither be accurate nor full enough for his purpose.

In offering, therefore, to the Agriculturists of Great Britain a Cyclopedia of Agriculture, Practical and Scientific, intended to be a Standard Book of reference on all the subjects of which it treats, we should greatly mistake the exigencies of the times did we present a mere compilation of bygone information, which, however interesting in itself, can be of little real use to the practical man.

The only way in which the knowledge of his art can be brought down to the present day; its various methods—detailed with accuracy for his information; and the explanations given of their success or failure which the now more perfect Theory of Agriculture has furnished; is to place every department of the wide subject in the hands of those who have made it their especial study.

To accomplish this desirable object has been the great aim of the Editor and Publishers of the Cyclopedia of Agriculture; and for this purpose the assistance of our most distinguished agricultural writers has been engaged. Each separate topic will be discussed by its own student, in order that the whole may be presented as perfectly as possible. The reader will therefore receive no mere compilation of other works—he will, in every section of the subject, be instructed by the man who has made it his especial study. Thus, even in the 'Calendar of Farm Operations,' which might, perhaps harmlessly, have been a mere abstract of previous publications on farm practice, the successive sentences have been penned by those who have themselves carried out the processes described, or the instructions suggested: and in that one appendage to the Work, the details of farm operations are given as actually practised in twenty different counties of Scotland and England, by more than twenty of our most successful farmers and cultivators.

As regards the body of the Work, the names of its writers—a list of which is appended—are sufficient guarantee for the practical value of the performance. A Work on the Theory and Art of Agriculture, of which the several departments are undertaken by such contributors, may well command confidence.

Illustrations on wood and steel, of Farm Buildings, Insects, Plants, cultivated and uncultivated, Agricultural Machines, Implements and Operations, &c., will be given wherever it is presumed they can be useful.

A LIST OF THE WRITERS.

THEORY OF AGRICULTURE.

Its BOTANY, fully Illustrated by Wood Engravings—John Lindley, Ph.D., F.R.S. Diseases of Plants—Rev. M. J. Berkeley, M.A., F.L.S., King's Cliffe, Wansford.

Its CHEMISTRY—Lyon Playfair, Ph.D., F.R.S.; John Thomas Way, Consulting Chemist to the Roy. Agricult. Soc. of England.

Its ENTOMOLOGY, including Descriptions and Illustrations of the Insects which injure or benefit Crops, and affect Cattle—John Curtis, F.L.S., Author of 'The British Entomology,' &c.

Its GEOLOGY—John Morton, F.G.S., Whitfield, Gloucestershire; Joshua Trimmer, F.G.S., of the National Geol. Survey.

Its HISTORY and GENERAL PHILOSOPHY—C. Wren Hoskyns, B.A.

ART OF AGRICULTURE.

The EDUCATION of its Practitioners—C. Wren Hoskyns, B.A.

Its PECULIARITIES, in England, Scotland, Ireland, and Flanders—Ph. Pusey, M.P.; Rev. W. Hickey, M.A., Thatcham Newbury, Berkshire; John Haxton, Tenant of Drumnod, Cupar-Fife; T. G. J. van den Bosch, Holland.

Its MACHINES, fully Illustrated by Engravings on Wood and Steel—John C. Morton, Whitfield, Berkeley, Gloucestershire.

Its BUILDINGS and ROADS, fully Illustrated by Engravings—James Newlands, C.E., Borough Engineer, Liverpool.

The SOIL: Valuation, Surveying, Enclosures—John Bravender, Land Agent, Cirencester. Improvement of Bogs and Wastes—Rev. W. Hickey, M.A. Draining—John Girdwood, F.R.S.S.A., Agricultural Engineer. Manuring—J. Hannam, Tenant, Kirk Deighton, Wetherby, Yorkshire. Cultivation—John Haxton, Cupar-Fife.

DOMESTIC ANIMALS and their Management: Comparative Anatomy, Diseases, &c.; the Horse, its Breeds and Management—W. C. Spooner, Veterinary Surgeon, Southampton. The Ox, its Breeds and Management; the Sheep, its Breeds and Management—Messrs. James Caird, Wigtonshire; J. A. Clarke, Lincolnshire; Colonel Le Couteur, Jersey; H. Strafford, Editor of the *Short-Horn Herd-Book*; G. Turner, Devonshire; E. F. Welles, Worcestershire; John Wilson, Berwickshire; and A. T. Wilson, Lammermuir. The Hog, its Breeds and Management—John Hannam, Yorkshire. The Dog, Rabbit, Pigeon, Goat, Ass—H. D. Richardson, Dublin. The Alpaca—W. Walton. The Bee—J. Wighton, Costessy Hall, Norfolk. Poultry—Rev. E. S. Dixon, M.A., Intwood-with-Keswick, Norfolk.

The DAIRY—Messrs. Haxton, Fifeshire; Palin, Cheshire; Stallard, Leicestershire; Tucker, Dorsetshire.

CULTIVATED PLANTS, including Crops, Grasses, and Trees—Messrs. Robert Baker, Land Agent and Tenant, Essex; J. A. Clarke, Lincolnshire; Hewitt Davis, Land Agent, London; J. H. Dickson, Flax-dresser and Agent, London; William Gorrie, Farm Manager and Factor, Mid-Lothian; John and Jas. Grigor, of the Norwich and Forres Nurseries; John Haxton, Fife; J. C. Morton; J. M. Paine, Surrey; Hugh Raynbird, Land Agent, Hampshire; William Roach, Gloucestershire; James Smeed, Kent; Robert Thomson, of the Horticultural Society's Gardens, Chiswick; John Towers, Surrey; T. Tucker, Dorsetshire.

ROTATION of CROPS—J. Caird, Tenant of Baldoon, Wigtonshire.

PASTURE FARMING—Messrs. J. A. Clarke, Lincolnshire; J. W. Clark, Hampshire; J. Hannam, Yorkshire.

CALENDAR of OPERATIONS, in Arable, Meadow, Dairy, and Stock Farming—Messrs. Bravender, Caird, J. A. Clarke, J. W. Clark, Glendinning, Gorrie, Haxton, J. C. Morton; Paine, Palin, Raynbird, Richardson, Roach, Russell, Smeed, Spooner, Stallard, Thomson, Towers, Tucker, J. Wilson, A. T. Wilson, J. Wighton.

AGRICULTURAL SOCIETIES—J. C. Morton.

AGRICULTURAL STATISTICS—J. C. Morton.

EFFECT of CLIMATE on the ART, R. Russell, Tenant of Kilwhiss, Cupar-Fife.

DOMESTIC ECONOMY—Bread, Beer, Cider, Meat, &c.—J. Towers, Surrey; William Ewart, Newcastle-on-Tyne.

BUSINESS OF FARMING.

RELATION of LANDLORD and TENANT—C. Wren Hoskyns, B.A.; John Gray, Agent for the Greenwich Hospital Estates; J. Dean, Land Agent; John Morton, Land Agent; J. C. Morton.

RELATION of TENANT and LABOURER—J. Ilderton Burn, of the Labourer's Friend Society; Rev. W. Hickey, M.A.; A. Somerville, Manchester (late of Berwickshire); J. C. Morton.

INVESTMENT of CAPITAL—J. C. Morton.

FARM ACCOUNTS—Thomas C. Morton, Accountant, Manchester.

MARKETS, SALES, &c.—J. Haxton, Fifeshire

LAWS RELATING to AGRICULTURE—J. G. Ball, Solicitor, Stroud; J. Bright, M.P., Rochdale; C. Wren Hoskyns, B.A.

BLACKIE AND SON:

QUEEN STREET, GLASGOW; SOUTH COLLEGE STREET, EDINBURGH; AND WARWICK SQUARE, LONDON.

AND ALL BOOKSELLERS.

GLASS FOR CONSERVATORIES, GREENHOUSES, FRAMES, &c.

JAMES PHILLIPS AND Co. are supplying SHEET GLASS, 16 ounces to the foot, in boxes of 100 feet each, at the following prices for cash :

Sizes. Inches.			Inches.			Per foot.	Per 100 feet.
		Under	6	by	4	at 1½*d.*	is £0 12 6

MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ¼ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

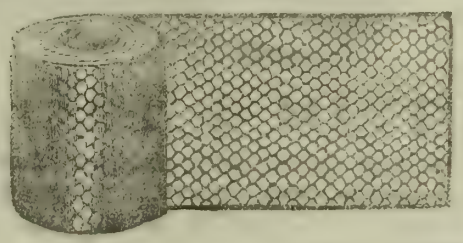
WARMING.

HOT-WATER APPARATUS, with improved Boilers, requiring no brickwork, and arranged to continue in action from 12 to 16 hours without attention, adapted for Churches, Chapels, Conservatories, and every description of Bui ding, supplied and erected on the most reasonable terms.

Also the THERMANTERION, an apparatus which warms without injuring the air, and recommends itself on account of its simplicity, durability, efficiency, and economy, especially adapted for Churches, Chapels, Halls, or Buildings, only used occasionally.—Apply to SPILLER and TAYLER, Engineers, Battersea.

POTTER'S GUANO.—MR. POTTER continues to prepare his GUANO, with the latest improvements, at the same low price which has given so much satisfaction. He recommends parties wishing to secure a genuine unadulterated article, to address their orders direct to the Factory, No. 28, Clapham-road-place, London.

N.B. Superphosphate of Lime and Gypsum, of guaranteed quality, at lowest prices.



Mr. POTTER has one of Cantelo's Egg-hatching Machines for sale, at less than half price.

NOTICE.—On Account of the POTATOES not being yet ready to take up, as formerly advertised by HAY, SANGSTER, and Co., the time is unavoidably altered to the 14th October.—18, Cumberland-place, Newington-Butts, London.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25*s.* upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch „ strong „	...	9 „	6½ „
2-inch „ extra strong „	...	12 „	9 „
1⅝-inch „ light „	...	8 „	6 „
1⅝-inch „ strong „	...	10 „	8 „
1⅝-inch „ extra strong „	...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.* per yard.	30 inches wide	7½*d.* per yard.
18 „ „	4½*d.* „	36 „ „	9*d.* „
14 „ „	6*d.* „	48 „ „	1*s.* „

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King-William-street, City; Cork-street, Liverpool; High-street, Birmingham: and the Exchange, Manchester.

SCURVY, LEPROSY, SCROFULA, AND ALL DISEASES OF THE SKIN, CAN BE CURED BY HOLLOWAY'S OINTMENT AND PILLS.—The heaviness, weariness, dejection of spirits, and other oppressions usually attendant on those who suffer from diseases of the skin, are speedily removed by the use of HOLLOWAY'S Ointment and Pills. The efficacy of these Medicines in improving the bad habit of body and curing complaints of this distressing nature stand unrivalled; and in many parts abroad, where the malady is so prevalent, the cures are wonderful. The purifying properties of the Pills, and the peculiar effect the Ointment has on the skin, render them superior to every other remedy.—Sold by all vendors of medicine, and at Prof. HOLLOWAY'S Establishment, 244, Strand, London.

NEW GERANIUMS, &c., AT REDUCED PRICES, NOW READY FOR SENDING OUT.

BASS AND BROWN have a large, healthy, and vigorous stock of the following, well-established in 4-inch pots. Orders will be executed in rotation as they are received.

NEW VARIETIES SENT OUT LAST SEASON.

BULBOUS ROOTS, GRAPE VINES, &c.

J. WEEKS and Co., King's-road, Chelsea, beg to inform the Nobility and Gentry that they have now got a large collection of fine Bulbs, which they can supply very cheap. Small collections made up, consisting of Hyacinths, Narcissus, Tulips, Jonquils, Crocus, Snowdrops, Gladiolus, Alstræmolum, Anemones, Ranunculus, Iris, Scilla, and other appropriate kinds, for 30*s.*, 20*s.*, and 10*s.* Priced Catalogues sent upon application. Also a very fine collection of GRAPE VINES IN POTS, from eyes two and three years old, for FORCING IN POTS or PLANTING.—STOVE AND GREENHOUSE PLANTS in extensive variety.

J. WEEKS and Co., King's-road, Chelsea.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

JOBSON'S PATENT LIGHT AND HEAT REFLECTING STOVE GRATE,

SUITABLE FOR

DINING AND DRAWING ROOMS, BREAKFAST AND BED ROOMS, HALLS, &c.

No. 1.

No. 2.

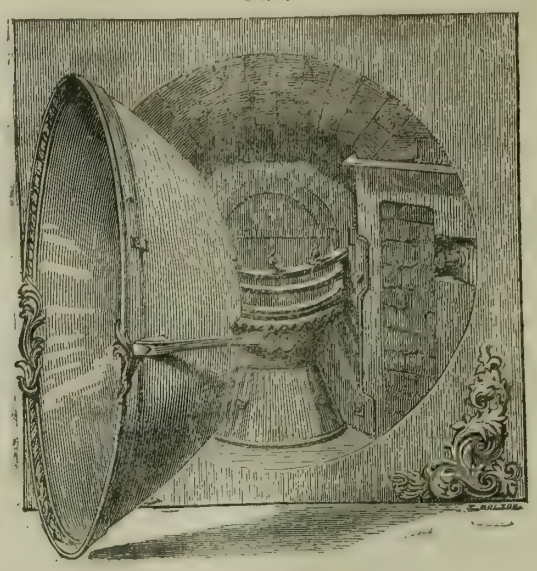

Fig. No. 1 shows the Stove as it appears when in use.
Fig. No. 2 shows the Reflector drawn out to remove the Ash-pan, &c.

(Extract from the *Architect* of July 6.)

"We have been much struck with the peculiarities of this admirable and scientific invention. It effects a considerable saving of fuel, and all the heat and light are so completely thrown into the room as to afford a degree of cheerfu ness and wa mth which twice the amount of fuel would fail to produce in any ordinary fire-place. The full heat is diffused equally into every corner, and the floor is thus warmed without any draught across the feet. Risk of fire is very much lessened by the facilities afforded for building the stove in, so as to secure it from the accumulation of soot at the back; and the simple contrivance by which the reflector is moved forwards and backwards at pleasure, gives perfect command over the ventilation and heat of the apartments. We must say, that in all its varieties, this new grate is truly admirable; we cannot speak too highly of the merits of the invention."

(Extract from the *Literary Gazette* of June 1.)

"So sound are the principles upon which the efficacy of this stove depends, and so ingenious are the contrivances to adapt those principles to the requirements of room-warming, aye, and of room-cooling (if over-heated), that we have no hesitation in describing Jobson's as the nearest approach we have yet seen to the perfection of a grate-stove."

COTTAM & HALLEN

Beg to direct public attention to JOBSON and CO.'s newly-patented Stove Grate, which for efficiency, combined with economy, they believe to be unequalled.

The peculiar features of this invention are that the Reflector entirely surrounds the fire; that it can be removed at pleasure, with the greatest ease; and that the Ash-pan, being placed out of sight, does not require to be taken out and emptied more than three times a week. A far greater amount of warmth is obtained from even a much less quantity of fuel than is used in the common fire-place, and its *very moderate price* brings it within the reach of *all classes.*

A SELECTED ASSORTMENT OF THESE STOVES; also a large and well-assorted stock of FURNISHING IRONMONGERY and BRASS and IRON BEDSTEADS—any of which latter can be fixed as Rheioclines, or Patent Spring Beds—may be seen at the Show-rooms, 76, OXFORD-STREET, three doors west of the Princess's Theatre.

COTTAM AND HALLEN, ENGINEERS, IRONFOUNDERS, AND IRONMONGERS.
MANUFACTORY, 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

HATTON NURSERY, NEAR HOUNSLOW, MIDDLESEX.
TO NOBLEMEN, GENTLEMEN NURSERYMEN, FLORISTS, AND OTHERS.

20,000 Scarlet and other Rhododendrons, 20 000 Ghent and other Azaleas, 2000 Andromedas, 6000 Kalmias, 2000 Hardy Heaths, 1000 Daphne Cneorum, 3000 Cedar of Lebanon, 1 to 4 feet, in pots, 300 Pæonia arborea; also a large quantity of Seedlings of sorts.

MESSRS. PROTHEROE AND MORRIS are directed, by the Executors of the late Mr. John Ronalds, to offer to an unreserved sale by Auction, on the premises, Hatton Nursery, near Hounslow, Middlesex, about 1½ mile from the Feltham Station, on MONDAY, October 14, and following day, at 11 o'clock, the whole of the valuable NURSERY STOCK, consisting of a large and rich assortment of American Plants, Evergreens, and Deciduous Shrubs, comprising Laurels, Irish Yews, Pinus of sorts; Spruce, Scotch, and Larch Firs; Lime, Alder, Ash, Plane, a large quantity of Quick, three fine specimens of Cedrus Deodara, 8 to 10 feet, &c.—May be viewed prior to the sale. Catalogues had (6*d* each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the auctioneers, Leytonstone, Essex.

N B. The whole of the valuable Stock of the Butts and Toplans Nurseries will be sold by Auction, on Monday, Oct. 21, and following days.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, October 11th, a superb collection of CARNATIONS, PICOTEES, and PINKS; also about 100 rows of very choice Tulips (the property of Mr. Willmer, Sunbury), together with a few first-rate double and single Hyacinths. May be viewed the morning of sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery Leytonstone, Essex.

A LARGE AND IMPORTANT SALE OF EVERGREENS
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Smith to submit to an unreserved Sale by Auction, on the premises, Dalston Nursery, Middlesex, on THURSDAY, October 17th, and following day, at 12 o'clock precisely, the whole of the valuable EVERGREENS, comprising fine-grown plants of variegated Hollies, Aucuba, Box, Laurestinus, Laurels, Phillyreas, Scarlet Aubutus, Bay, Rhododendrons, Azaleas, Lilac, Ivies, Brooms, and Clematis in pots, together with the remaining Greenhouse Plants. May be viewed, and Catalogues had, one week prior to the sale (6*d* each, returnable to purchasers) on the premises; of the principal seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

FARM WANTED IMMEDIATELY IN WILTS OR DORSET.

MR. HURLEY is instructed to obtain immediately A GOOD TURNIP-LAND FARM, OF 50 OR 100 ACRES, with good Farm-house and Buildings, in either of the above counties.—Full particulars to be sent to the Agricultural Agency Offices, 62, Nelson-square, Blackfriars-road, London.

DEVON.—DELIGHTFUL RESIDENCE, WITH LAND, TO BE SOLD OR LET IMMEDIATELY.

MR. HURLEY is instructed to dispose of a beautiful ESTATE in Devon, having an excellent RESIDENCE, situate near the Market Town of Bideford (which will be the terminus of the Taw Vale Railway), 38 miles from Exeter, and close to the Church; is very picturesque, a south aspect, well sheltered, diversified Scenery, excellent Walled Garden, Green-house, and 27 acres of Land in a ring fence, in the highest state of cultivation. A Trout Stream runs through the property, which is two miles only from the sea, running at spring tides up to the gates. Price 2000 guineas. Rent 90*l.*—For plans and to treat, apply to the Auctioneer (enclosing two stamps), 62, Nelson-square, Blackfriars-road, London.

FARMS TO LET AT MICHAELMAS NEXT.

MR. HURLEY, Farm and Estate Agent, is instructed to let the following, amongst other desirable farms: No. 1.—TWO EXCELLENT FARMS in Herts, 26 miles from London, and close to the Great Northern Railway, consisting of 526 and 287 acres respectively, admirably adapted for Turnips, Wheat, &c., and for carrying a large flock. Rents, 18*s.* and 21*s.* per acre; superior residences and buildings. No. 2.—A first-rate Farm of 160 acres, near Windsor; good house, &c. No. 3.—A capital Farm at Enfield, of 105 acres, equally divided; superior residence and buildings. No. 4.—An excellent Farm, with gentleman residence, &c., with 100 acres of very capital land, equally divided; situate in Essex, within 4 miles of the Harlow station. No. 5.—A good Farm in Sussex of 230 acres, well drained, and adapted to the growth of Wheat and Beans, but not of heavy tillage. Rent 20*s.* per acre, tithes, &c., 6*s.* Good Premises; tenant may propose his own terms. No. 6.—A small Farm of 61 acres, in Sussex, with Farm-house and two Cottages. Rent, on lease, 50*l.* a year. No. 7.—A capital Farm, in Kent, of 220 acres. Rent 135*l.* a year, tithe 30*l.* Two capital Farms, in Surrey, of 400 and 170 acres. Rent and tithes low; the latter tithe free. Another, in same county, of 600 acres; rent and tithes very low. Also a good Farm at Fulmer, Bucks, of 90 acres, nearly equally divided. And, lastly, three Farms, in Kent, consisting of 155, 123, and 76 acres respectively; rents low.—Apply for terms (inclosing two stamps) to the Auctioneer, 62, Nelson-square, Blackfriars-road, London.

WANTED, A SMALL FARM, from 20 to 50 acres. Particulars to be sent to Mr. HURLEY.

CHELSEA.—IMPORTANT SALE OF NURSERY STOCK.
TO NOBLEMEN, GENTLEMEN, AND OTHERS, ENGAGED IN PLANTING.

MR. D. A. RAMSAY has received instructions to submit to public competition by Auction, on the Premises, opposite Cremorne Gardens, King's-road, Chelsea, on TUESDAY October 1st, and two following days, at 12 o'clock (without reserve), by order of Messrs. W. Dennis & Co., to clear about five acres of land required for building purposes. The Stock comprises a large assortment of fine Evergreens, large Irish Ivies, and other Creepers in pots; 300 varieties of the finest Prize Gooseberries, a large quantity of Mulberry Trees of all sizes; the collection of Standard, Dwarf, and Pillar Roses; choice Deciduous Shrubs, Ornamental Trees, &c. The Stock on view till the time of sale.—Catalogues may be had on the premises; of the principal Seedsmen; and of the Auctioneer, Brompton Auction Ground, Fulham-road, London.

Printed by WILLIAM BRADBURY, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, SEPTEMBER 28, 1850.

12 new Petunias of 1850	18	0
Superior mixed double Hollyhocks, per dozen	6	0
Superb named di to, per dozen	18	0

CHOICE SEEDLING CALCEOLARIAS AND CINERARIAS.

JOHN HENCHMAN begs to state that he has a few hundreds of choice seedlings to spare, from the stock raised for his own growth, at 2*l.* per 100. The seed was saved with great care from choice varieties, and the plants are free and healthy. The Cinerarias will commence blooming in February and March, and the Calceolarias in April and May, and will continue to bloom all the summer. Orders amounting to 2*l.* sent carriage free to any part of England. A few packets of Calceolaria seed at 1*s.* and 2*s.* 6*d.* each. A remittance requested from unknown correspondents.
Edmonton, near London.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready. It contains Descriptive Priced Lists of Superb Seedling and other Ranunculi, Gladioli, Early and Double Tulips; also Priced Assortments of Choice Imported Dutch Hyacinths, Narcissus, Iris, Jonquils, Crocus, the Lancifolium and other Lilies, with a great variety of other bulbs and dry roots. The latter part contains Descriptive Lists of Choice and Select Roses, a few New and other desirable Evergreen and Flowering Shrubs, Hardy Climbing and Hardy Herbaceous Plants, Prize Gooseberries, and other choice fruits, &c.
A separate List of Geraniums and other new and select plants at reduced prices. Catalogues forwarded, prepaid, for two penny stamps.
Our Foreign Bulbs have arrived in fine condition.
Seed and Horticultural Establishment, Sudbury, Suffolk.

FIRST CLASS SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER.—*This beautiful flower was exhibited at the Chiswick Horticultural Fête, May* 18, 1850, *and was very much admired, and was also noticed by all the leading publications; a description of it will be found in the* Gardeners' Chronicle, *by* Professor LINDLEY; *in the* "Florist," *by* Mr. Beck; *and in the* "Gardeners' Magazine," *by* Mr. GLENNY; *all of whom speak in the highest terms of praise. Two Seedling Plants were also exhibited at the Royal Devon and Cornwall Horticultural Show, two days previous to the Chiswick Show, and won a Seedling Prize. It was noticed by the editor of the* Plymouth Herald, *and as it gives a good description of it we extract it.*

"One of the principal attractions at the Show was a magnificent Seedling Geranium, raised by William Rundle, Esq., Montpellier House, Devonport, and for which an extra prize was awarded. It attracted the attention of every florist, and was undoubtedly one of the best flowers in the room. The ground colour is a bright pink, with a *pure white centre*, extending over one-third of the upper petals. It has a rich and velvety crimson maroon spot, beautifully tinted, and shaded off to the ground colour. It is an extra-sized flower, of good shape and substance, like Lyne's celebrated flower, *Forget-Me-Not*. In fact, it has very much the habit of this sterling flower, being of a short, robust growth, and throws its fine flowers well above the foliage."

Further description would be unnecessary, more than for us to say, that we are certain it will give the most complete satisfaction to every customer, and we can recommend it with the same confidence that we introduced Lyne's *Duke of Cornwall*, *Forget-Me-Not*, and Arnold's *Virgin Queen*. *These are all sterling flowers and are much admired even at the present day.*
Price 20*s.* each. One given over three to the trade.
Good strong plants will be ready about the middle of October. Apply to WILLIAM E. RENDLE and Co., Nurserymen, Plymouth.
Our new descriptive Catalogue of Geraniums, Azaleas, Camellias, Fuchsias, &c., is just published, and can be had on application for one penny stamp.

TESTIMONIAL TO MR. MUNRO, late Gardener to the Horticultural Society of London.—At a Preliminary Meeting, held at the Roebuck Inn, Turnham Green, September 30th, 1850; Mr. Glendinning, Mr. Thompson, Mr. Cock, Mr. Edmonds, Mr. Gordon, Mr. Caie, Mr. Ayres, and Mr. Ivison being present, Mr. GLENDINNING was called to preside. Mr. Caie was then elected Secretary, and Mr. Edmonds Treasurer.
It was then Resolved, That a subscription not exceeding Half-a-crown for each person should be entered into for the purpose of presenting Mr. MUNRO with a suitable Testimonial of esteem, on his retiring from the superintendence of the Horticultural Society's Garden, which appointment he held for upwards of Thirty years.
Persons desirous of contributing are requested to forward their subscriptions to the Treasurer, Mr. Charles Edmonds, Chiswick House, Chiswick, Middlesex.
It was also Resolved, That the Subscription List be closed on Saturday, November 16th, 1850.
*** Post office orders payable at Turnham Green.

ROSE CATALOGUE.

H. LANE AND SON, Great Berkhamstead, Herts, will send their New CATALOGUE to all their old customers free, and new applicants may have it by enclosing two penny stamps. Those who are about planting Pleasure Grounds, &c., should inspect H. L. and Son's Nurseries (about 50 acres), as they have a fine healthy stock of some thousands of Cedrus Deodara, 2 to 4 feet; Araucarias, 2 to 3 feet; Abies Douglasi, from seed, 4 to 5 feet; with all the leading Pinus. Rhododendrons, all the hardy varieties from white to crimson, growing in loam, from which they remove readily; also the hybrids of Sinensis, greenhouse varieties; Azaleas, best Ghent; with a general collection of Trees and Shrubs, both for the Pleasure Ground and Park; also of Fruits, Catalogues of which may be obtained by enclosing two penny stamps. The stock of Plants at these Nurseries is kept constantly removed, to ensure success, and not drawn up to be sold at a price to deceive the public. Double Camellias, and Greenhouse Azaleas, 1 to 4 feet—prices given on application.

GERANIUMS.

JOHN CATTELL has now ready to send out fine healthy plants of the following new and splendid sorts, at the prices annexed: Prince of Orange, 10*s.* 6*d.*; Nandee, 7*s.* 6*d.*; Nonesuch, 10*s.* 6*d.*; Christabel, 7*s.* 6*d.*; Lord Gough, 5*s.*; Lord Stanley, 5*s.*; Crispina, 5*s.*; Satisfaction, 5*s.*; the set of eight, including package, 40*s.* The above are Hoyle's set of eight, as sent out in November 1849, at 21*s.* and 31*s.* 6*d.* each. Twelve of the following very superior sorts, mostly new ones in 1848, purchaser's selection, package included, for 24*s.* (Those with F are fancy varieties): Salamander, Oriflame, Rosamond, Abd-el-Kader, Brilliant, Virgin Queen, Windsor Castle, Crusader, Flamingo, Mont Blanc No. 2, Forget-me-Not, Alboni (F), Hero of Surrey (F), Jenny Lind (F), Odorata magnifica (F). Every sort of the above ought to be in the most unique collection.
The best and most distinct of the older kinds, both Fancy and Florist varieties, 12*s.* per doz. Scented sorts, in 12 varieties, 8*s.*; Flower of the Day, strong, 10*s.* 6*d.* each.

DUTCH AND OTHER BULBS.

J. C. begs to observe that his collection of the above have arrived in fine condition, a priced Catalogue of which is now ready, and may be had on application by enclosing a penny stamp. He would particularly call attention to his very splendid Seedling Lilium speciosum or lancifolium, eight varieties of which are entered in his Catalogue, worth adding to every collection, as they come into flower a fortnight before punctatum, and vary in colour from punctatum to deeper than Speciosum rubrum. Also to his fine collection of Amaryllis, &c. A remittance or reference from unknown correspondents.
Westerham, Kent, Oct. 5.

RARE AND HARDY CONIFERÆ.—Planters are respectfully informed that YOUELL and CO. can supply 25 Rare and Hardy species of the above, in pots, for 5*l.*, package included and carriage paid to London or Hull, names of which can be had on application. They also invite attention to their extensive Stock of ARAUCARIA IMBRICATA (well adapted for sea-side planting), and CEDRUS DEODARA, which they can supply in any quantity from 1 to 3 ft. in height.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND Co. are now executing orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, in beautiful, healthy, dwarf, bushy plants, set with flower-buds, and in 5 inch pots, at 12*s.* per dozen. A few sets of the 9 Liliputian Chrysanthemums of 1849, in 5-inch pots, at 12*s.* the set.

NEW CAMELLIAS, &c.

YOUELL AND CO., possessing an extensive Stock of all the new and very best varieties of the above, in beautiful healthy plants, well furnished with flower-buds, beg to offer them at 30*s.* per dozen, package included. Catalogues can be had on application.
PINKS, all the finest first-class show varieties, comprising such as have been exhibited in all the winning stands at the past metropolitan exhibitions, 12*s.* and 18*s.* per dozen pairs, and can be sent post free.
HYACINTHS, a superb collection of all the best kinds known, for glasses or pot culture, at 9*s.*, 12*s.*, and 18*s.* per doz.
STRAWBERRIES.—The following are warranted true to name:

NEW SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER has been Purchased by the following Nurserymen:—Messrs. Henderson and Co., Pine-apple-place; Messrs. E. G. Henderson and Co., St. John's Wood; Mr. Charles Turner, Royal Nursery, Slough; Messrs. Bass and Brown, Sudbury; Mr. Keynes, Salisbury; Mr. W. Cock, Chiswick; Mr. B. N. Cant, Colchester; Mr. W. Bragg, Slough; Mr. Wm. Ivery, Peckham, Surrey; and most of the other leading Nurserymen in the kingdom.
Strong Plants now sending out, 20s. each, one-third off to the trade, with one added to every three.
Apply to WILLIAM E. RENDLE & Co.,
NURSERYMEN, PLYMOUTH.

TO NURSERYMEN, FLORISTS, &c.

A. VAN GEERT, FLORIST, Ghent, begs to inform the above that he has just published his New CATALOGUE OF PLANTS, which may be had on application to his Agents, BETHAM and BLACKITH, Custom House, Shipping, and General Forwarding Agents, Cox and Hammond's Quays, Lower Thames-street, London.

SEEDLING CINERARIAS.

WM. IVERY has selected from his stock of superb SEEDLINGS, the following varieties, which are now ready to send out.
CINERARIA ELECTRA.—A violet purple, petals broad, notch scarcely perceptible, outline tolerable, habit beautiful, size average, colour new, bright yellow disc, and flower abundant. 7*s.* 6*d.*
CINERARIA MADAME MIELLEZ.—Pure white ground, black eye, blue edge, the colour of the Neapolitan violet, not the slightest notch, petals broad, indentation between the petals slight, bloom abundant, and habit excellent.
The above are figured in the "Gardeners' Magazine of Botany," May, 1850; from which this description is taken. 7*s.* 6*d.*
CINERARIA FEARLESS.—Light blue, fiery centre, white disc, and form good. 5*s.*
CINERARIA EMPRESS.—Clear white ground, edged with rosy purple, very fine truss of flowers. 5*s.*
W. I. can supply good show Cinerarias at 15*s.*, 21*s.*, and 30*s.* per dozen. A Select Catalogue of Cinerarias, Geraniums, Fancy Ditto, Scarlet Ditto, Fuchsias, Verbenas, Antirrhinums, Phloxes, Choice and Select Plants.
Hanover Nursery, Peckham, near London.

TO GENTLEMEN ENGAGED IN PLANTING, BUILDERS, AMATEURS, &c.

J. J. FOSTER, of the Edgeware Nurseries, begs to announce that he has a large Stock of fine EVERGREENS, FRUIT TREES, ORNAMENTAL SHRUBS, and FOREST TREES, which, being grown on an adhesive soil, move safely, with good balls of earth. He has also a beautiful collection of the finest ROSES, admirably well grown. The whole at moderate prices.—Coaches leave the Old Bell, and Black Bull, Holborn, several times a day, and pass the Nurseries. Fares, outside, 1*s.*; inside, 1*s.* 3*d.* Goods delivered in town, and at 12 miles distance round, free of charge.

AURICULAS, ALPINES, POLYANTHUSES, CARNATIONS, PICOTEES, PINKS, PANSIES, PRIMROSES, RANUNCULUSES, AND THE LANCASHIRE SHOW GOOSEBERRY-TREES, &c.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, respectfully informs purchasers of the above "Florists' Flowers" that his extensive Collections are unrivalled for health and vigour, and to which every new variety is regularly added as soon as out.
Priced Catalogues of all the above are now ready, and may be obtained by enclosing a postage stamp.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's-wood, London, begs to announce that on the 20th of this month he will be prepared to send out the following new FANCY GERANIUMS, raised by him, and proved in 1850; and he feels confident they will give as much satisfaction as Geranium Alboni sent out by him last year.
BLACK PRINCE, 10*s.* 6*d.*—A fine rich dark maroon (upper and lower petals same colour), with light centre, the petals slightly margined with rose; a free bloomer, of good habit, and quite distinct.
EXQUISITE, 10*s.* 6*d.*—A fine clear smooth-edged flower; upper petals, blotch of lilac with deep belt of bright rose, margined with white; under petals marked with rose; a nice compact trusser, of good habit, and an early bloomer.
MARION, 10*s.* 6*d.*—Upper petals rich crimson, with clear white margin; under petals clear white, with belt of bright rose; white centre; a good dwarf close habit, an abundant bloomer, and continues flowering in perfection the whole season.
PRIMA DONNA, 10*s.* 6*d.*—Upper petals dark crimson-purple, shading off in veins to a light edge; lower petals blotched and pencilled, having a striped appearance; a good trusser, free bloomer, and retains its flowers for a considerable time.
PRINCE ALBERT, 10*s.* 6*d.*—Upper petals deep crimson velvet, with clear white margin; under petals white, blotched and veined with violet; large flower, a very constant and free bloomer.
REINES DES FLEURS, 10*s.* 6*d.*—Clear white ground, with intense violet plum blotch, and broad belt of white; under petals white, slightly marked with rosy purple; good form and a free bloomer.
E. G. H. can recommend the above as being perfectly distinct in themselves, and from any other varieties now in cultivation.
E. G. H. will also have the following new PELARGONIUMS to send out at the same time:
CORA, 7*s.* 6*d.*—Orange scarlet white centre, moderate size, a remarkable early blooming variety.
FIREBALL, 10*s.* 6*d.*—A beautiful rich crimson scarlet, centre violet shading to white, a decided improvement on Salamander.
PRINCESS ROYAL, 10*s.* 6*d.*—A fine rich purple flower, with a deep blotch of maroon on upper petal; good habit and free bloomer.
STANDARD BEARER, 10*s.* 6*d.*—A fine bold flower, upper petals a rich orange crimson, lower petals bright salmon; excellent habit and free bloomer.

CUTHILL'S "BLACK PRINCE" STRAWBERRY.

WILLIAM HUSSEY has to offer the above early STRAWBERRY at 4s. per 100; and also the undernamed kinds, at, per 100.

British Queen	...	...	2s 0d	Keens' Seedling ...	2s 0d
Comte de Paris	...		2 6	Princess Alice Maude	2 0
Eleanor	...	...	3 6	Caroline...	2 0
Elton Pine	...	...	2 0		

VINES from Eyes, 2s. 6d. to 3s. 6d. each.

Seedling CINERARIAS, raised from all the best named sorts of last year, at 3s. per doz., post free 3s. 6d.—A Catalogue of W. H.'s Collection of Florists' Flowers and other Plants can be had by enclosing one penny stamp for postage.

Horticultural Gardens, Norwich, Oct. 5.

ROSA MANETTII.—An Amateur wishes to dispose of 200 or 300 Standard and Dwarf ROSES, also 100 or 200 MANETTII Dwarfs for stocks, which are in good condition, and first-rate varieties, mostly autumnals; they will be sold at about half the usual price. Any person taking the whole quantity may have them very reasonably.—Apply, post paid, to W. H. S., 9, Wellington-street North, Strand, London.

HERTFORD ROSE NURSERIES.

E. P. FRANCIS'S NEW ROSE CATALOGUE, containing all the newest kinds introduced and worth cultivating, will be ready for delivery on and after Monday, October 7, and will be forwarded gratis on application. The Collection this year is very extensive and remarkably fine.

TRUE DOUBLE ROMAN NARCISSUS.

ROBERT HALL begs to advise the arrival of his annual importation of the above-named, which is the most fragrant of all the Narcissus, price 3s. per dozen. Also True Dutch Hyacinths, best sorts, 6s. per dozen, or three dozen for 15s.; Crocus, Jonquils, &c., at his Foreign Warehouse, 63, South Audley-street, Grosvenor-square, facing the Chapel.

AMBROSE'S SEEDLING FANCY PELARGONIUMS.—To be sent out the middle of October, for prepayment only, the first remittance to secure the first selection. Post-office orders are requested to be made payable at Chelsea.

GAIETY.—A small, distinct, and pleasing variety, top petals rich mulberry, with a pink margin; lower petals spotted with the same, a close grower, and very free, the leading fancy flower of the season. 21s.

BELLE MARIE.—A fine, distinct flower, smooth, and of fine substance, top petals rich mulberry, margined with crimson, lower petals with the same; constant and free; the only fancy Geranium that obtained a certificate at the Royal Botanic Exhibition of 1848. 21s.

NE PLUS ULTRA.—A great novelty, top petals deep crimson, shaded with purple; lower petals much the same colour, having a delicate margin of pale pink, a well-defined white throat, very distinct, the truss having very much the appearance of an Auricula flower; a close grower, and very free. 21s.

PERFECTION.—Top petals bright rose, margined with white; lower petals spotted with rosy lilac; free bloomer, constant, and excellent habit. 10s. 6d.

DELIGHT.—Ground colour blush, top petals having a beautiful pink blotch, and prettily pencilled with rose; fine habit, and free bloomer. 7s 6d.

PILOT.—Ground colour white; top petals blotched with mulberry, lower petals having a spot of the same colour on each; fine dwarf habit, and very free. 10s. 6d.

W. A., having a few packets of Fancy Geranium Seed to dispose of, begs to offer the same at 2s. 6d. per packet of 40 seeds. Battersea, Oct. 5.

DUTCH BULBS, EARLY FLOWERS FOR THE WINTER AND SPRING ADAPTED FOR BLOOMING IN-DOORS AND IN THE BORDERS. — The undersigned having received their annual importation of DUTCH BULBS from Haarlem, offer the following choice collection for 10s., viz.: Half-dozen first-rate Hyacinths for glasses, Half-dozen good Hyacinths for pots, 50 Crocuses, four separate colours; 50 Double Snowdrops, Half-dozen Double Van Thol Tulips, Half-dozen Early Van Thol Tulips, 1 dozen Double White Sweet-scented Narcissus, Half-dozen Double Jonquils, 1 dozen Winter Aconites, 25 splendid Mixed Tulips, and 1 dozen best Mixed Double Anemones.—CLARKE and COMPANY, Seedsmen and Florists, 86, High-street, opposite the Town-hall, Borough, London.

PLANTING SEASON.

H. SILVERLOCK invites inspection of his superior Stock of ORNAMENTAL EVERGREENS, 1 to 6 feet in height (among which are Laurustinus, full of bloom-buds, 1 to 3 feet), FLOWERING SHRUBS, and FOREST TREES, TRAINED and other FRUIT TREES, of the best kinds, all of which having been frequently transplanted, and great care be-towed on their training and cultivation, are in excellent order for removal, and will be offered at moderate prices.

H. S. has also a collection of the choicest and most desirable CONIFERÆ in pots, and a large stock of CAMELLIA JAPONICA, in fine condition.—North Gate Nursery, Chichester.

BULBOUS ROOTS, GRAPE VINES, &c.

J. WEEKS and Co., King's-road, Chelsea, beg to inform the Nobility and Gentry that they have now got a large collection of fine Bulbs, which they can supply very cheap. Small collections made up, consisting of Hyacinths, Narcissus, Tulips, Jonquils, Crocus, Snowdrops, Gladiolus, Alstræmeria, Anemones, Ranunculus, Iris, Scilla, and other appropriate Kinds, for 30s., 20s., and 10s. Priced Catalogues sent upon application. Also a very fine collection of GRAPE VINES IN POTS, from eyes two and three years old, for FORCING IN POTS or PLANTING.—STOVE AND GREENHOUSE PLANTS in extensive variety.

J. WEEKS and Co., King's-road, Chelsea.

REMARKABLY CHEAP.

JAMES TURRELL begs to offer to the Public the finest and cheapest lot of FOREST TREES, SHRUBS, &c., ever offered for public sale. The Trade liberally treated with.

FOREST TREES, of sorts, 8 feet high, 42s. per 1000.

Arbutus 2½ feet; Arbor-vitæ, 4 feet; Cedars, 4 feet; Bay, 3 feet; Yew, 4 feet; Cypress, 4 feet; Manilla Box, 2 feet—9s. per dozen.

Laurustinus	...	...	...	per 100, 50s. fine.
Quick	...	...	...	per 1000, 10s.
Larch	...	...	...	per 1000, 30s. strong.
Privet	...	...	...	per 1000, 40s. fine.

Dwarf Box, Laurel, Firs, Portugal Laurel, Euonymus, Box, Evergreen—3 to 4 feet high, 4s. per dozen.

Var. Holly, fine, 10s. 6d. per dozen; Broad leaf ditto, fine, 10s 6d. per dozen; Large Spruce Fir, 4s per dozen; Aucuba, from 4s. to 6s. per dozen; Alaternus, 6s. per dozen.

J. T., wishing to clear his ground of some of his large stock of Trees and Shrubs for other purposes, feels confident greater bargains cannot be made elsewhere.

When large orders are given liberal allowance will be made. Remittances are requested from unknown correspondents, to be made payable to J. TURRELL, Providence Nursery, Ramsgate.

TO GARDENERS, &c.

GUTTA PERCHA TUBING for Watering Gardens, spreading Liquid Manure, &c., may be had joined up to any length. Waterproof Soles for Boots and Shoes. Thread for tying up Plants. Gutta Percha Canvas suitable for nailing up Trees, &c.—Manufactured by THE GUTTA PERCHA COMPANY PATENTEES, 18, Wharf-road, City-road, London.

HOYLE'S SEEDLING PELARGONIUMS.

C. TURNER has a few strong plants left of Ajax, May Queen, Nectar Cup, Flavia, Generalissimo, Corinne, Isis, and Cardinal. No more orders can be received for Ocellatum or Rubiola.

Catalogues, with full description, can be had on application.

Royal Nursery Slough, Oct. 5.

NEW CARNATIONS, PICOTEES, PINKS, AND PANSIES.

CHARLES TURNER'S DESCRIPTIVE CATALOGUE is now ready, containing some fine new varieties of the above, not before offered for sale.

Royal Nursery, Slough, Oct. 5

KNIGHT AND PERRY, Exotic Nursery, King's-road, Chelsea, respectfully invite an inspection of their fine healthy stock of PEACH, NECTARINE, and other FRUIT TREES (free from insect, and of all the best kinds, both trained and untrained), which cannot fail to afford complete satisfaction wherever supplied, as they combine the advantage of the most elaborate attention to their culture, both in root and branch, with a particular method of labelling, ensuring the accuracy of each kind; their stock of VINES, raised from eyes obtained from the fruiting plants of the most eminent growers in the country, is larger than ordinary, and of first-rate excellence.—Exotic Nursery, King's-road, Chelsea.

SCARLET PELARGONIUMS.

CONWAY'S "*PRINCESS ALICE," colour Vermillion, with a white eye, large globe truss, free bloomer, of good habit, and a very desirable variety, either for pot or bedding. Strong plants, 5s. each.

Also, now ready to be sent out, strong plants of Flower of the Day, 10s. 6d.; Commander-in-Chief, 5s.; Princess Royal, 2s. 6d.; Queen of Summer, 2s. 6d.; Trentham Scarlet, 1s. 6d.; Queen Improved, 1s. 6d.; Excellence, 1s. 6d.; Royalist, 1s.; Punch, 1s.; Gem, 1s.; Cottage Maid, 1s. The above selection of 12 attractive varieties may be had for 30s., basket included.

New Petunia, "*Captivation," white with purple throat, large and well shaped flower; a good bedding plant. 3s. 6d. each.

Geranium "*Coronata," pink and white; profuse and perpetual bloomer, flowering very early in the greenhouse. 3s. 6d. each.

Calceolaria "*Multiflora," yellow, compact dwarf variety, for bedding. 3s. 6d. each.

* These plants were shown at the metropolitan exhibitions this season, and were greatly admired.

MARY CONWAY, Earl's Court Nursery, Old Brompton, London.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6s. per dozen; smaller ditto, 3s. per dozen; or 1l. per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2s. 6d. each; or smaller ditto, 1s. 6d. each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3s. per dozen.

True BATH COS LETTUCE SEED, 1s. per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1s. per packet.

ANTIRRHINUM SEED from all the best varieties, 1s. per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2s. 6d. per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

FOREIGN BULBOUS ROOTS.

WM. HAMILTON, SEEDSMAN, &c., 156, Cheapside, London, begs to state that his Priced Catalogue of the above is now ready, and may be had gratis on application.

HYACINTHS in colours, named, for pots or glasses, 6s., 9s., and 12s. per dozen; in mixtures, 3s. per dozen. MIXED DUTCH CROCUS, 1s. 6d. per 100. TULIPS for early forcing, 1s. per dozen. SNOWDROPS, 2s. 6d. per 100. NARCISSUS, 4d. to 6d. each. GLADIOLUS, IXIAS, IRIS, RANUNCULUS, ANEMONES, and a large assortment of other Roots, the prices of which will be found in his Catalogue.

W. H.'s Improved Supporter for Hyacinths, &c., 6d. each.

*** Not to be equalled by any now offered to the public.

Address—156, Cheapside, London.

NEW SEEDLING PANSIES—"COMMANDER-IN-CHIEF" AND "PRINCE ARTHUR."

YOUELL AND CO. beg to announce they are now prepared to execute orders for the above first-rate PANSIES, which they guarantee will give the highest satisfaction.

"COMMANDER-IN-CHIEF" was exhibited at the Worton Cottage Meeting of May 29th, under the initials of "T. T.," and the following opinion is given in "Beck's Florist" of July last: "No. 2, Yellow ground, bronzy purple top petals, lower ones margined with the same colour, bold eye, showing to great advantage: *a fine flower for Exhibition*"

The following opinion of this fine flower is also given in the *Gardeners' Chronicle*, of June 20th, under the initials of "Y. Y." "No 2, Rich yellow ground, top petals dark maroon, lower petals margined with the same colour—eye good; a full-sized and fine flower."

"PRINCE ARTHUR," white ground, top petals rich dark purple, lower ones margined with the same colour, eye good—flowers large and of great substance.

This was exhibited with "Commander-in-Chief" at the Worton Cottage Meeting, and obtained the following opinion: "No 38, Style of Optimus, and a considerable improvement upon it, having more ground colour."

Strong plants of the above 5s. each per post free if required; and one over to the Trade when three are ordered.

Royal Nursery, Great Yarmouth, Oct. 5.

COCHIN CHINA FOWLS.—FOR SALE, a few choice full grown Chickens, bred from imported birds.—Apply to JAMES MATHEMER, Fit Place, Grays, Essex. The Gravesend steamers call at Grays pier.

COCHIN CHINA FOWLS.—A few well bred Birds of this season for sale. For particulars.—Apply to Messrs. JESSOP BROTHERS, Nursery Gardens, Cheltenham.

PHILLIPS' PATENT FIRE ANNIHILATOR.—The Directors of the Fire Annihilator beg to inform the public that, with the consent of Her Majesty's Commissioners of Woods and Forests, they have completed the erection in Battersea Fields, near to the Water-works (about a quarter of a mile from the Nine Elms Pier), of a house of larger dimensions than that recently set fire to at Woolwich, the whole of which they intend to set fire to on TUESDAY, the 8th of October, at 11 o'clock A.M. precisely, in order to show the efficacy of the Annihilator in extinguishing fire. They have also purchased a vessel, in the hold of which they will make a large fire for the same purpose. Tickets of admission may be had gratis on application by letter addressed to the Secretary of the Fire Annihilator Company, 105, Leadenhall-street, City. N.B. Those who are not able to obtain tickets will have an opportunity of witnessing the demonstration from the river, nearly opposite Pimlico Pier.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK Manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted. Priced lists of plant tubs and boxes forwarded on application.

PIMLICO SLATE WORKS. — Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 4s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

FERNS.

JAMES PHILLIPS AND CO. beg to direct attention to their new description of GLASS SHADE and DISH for the growth of Ferns, at once ornamental and better adapted than any other yet made. Price varying from 2s. to 13s. each.

HYACINTH DISHES.			ROOT GLASSES.

Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

SPLENDID NEW GERANIUM—"THE VILLAGE MAID."

HENRY WALTON, Florist, &c., Edgend, Marsden, near Burnley, Lancashire, begs to offer to his kind patrons and the public in general his splendid light SEEDLING GERANIUM, "THE VILLAGE MAID," of which the following description was given in the Gardeners and Farmers' Journal, July 13, 1850: "Your seedling is a noble flower; form good; upper petals purplish crimson, shading to bright rose, veined with black, beautifully margined with white; the lower petals well shaped, of the purest white, almost resembling frosted silver, their exquisite consistency inducing this magnificent appearance. We are averse to eulogising a Pelargonium on the inspection of a single pip, but the universal beauty of yours has induced the exception." Opinion of Mr. Whomes, Windsor Nursery: "Lower petals stout and decided good white, with great breadth; the upper petals finely formed and well covered; a decided beat on Arnold's Virgin Queen." Opinion of Mr. E. Tiley, Nurseryman, Pulteney Bridge, Bath: "I have received your Geranium blooms, which I have shown to two or three Geranium growers, and they were of the same opinion as myself—that it is one of the best shaped flowers yet grown, and very distinctly marked."

H. W. can with confidence recommend the above as a fine trusser and good habit. Strong plants, well established, 1*l.* 1*s.* The usual allowance to the Trade, and one over when three are taken.

H. W. also begs to inform his numerous patrons in general that his Autumn Catalogue of Geraniums, Fuchsias, Cinerarias, Hollyhocks, &c. &c., is now ready, and may be had on application, inclosing one stamp.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s.* per 100.

Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s.* 6*d.* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 20*s.* per 100.—Manor Farm, Deptford.

NEW ROSE CATALOGUE.

WM. WOOD AND SON have the pleasure of announcing that their DESCRIPTIVE CATALOGUE for the ensuing season is now ready. In addition to the splendid collection enumerated in former Catalogues, the present edition contains many varieties of first-rate merit.

As heretofore, the Catalogue will be duly forwarded to all who have favoured W. W. and S. with their commands, and may be had Gratis on application; also Catalogues of Ornamental Trees and Shrubs, Coniferæ, American, Herbaceous, and Greenhouse Plants; and Descriptive Catalogues of New and Choice Fruit-trees, new Verbenas, Fuchsias, Cinerarias, &c. &c. The Trade Catalogue is also now ready.

Woodlands Nursery, Marefield, Uckfield, Sussex.

MESSRS. STANDISH AND NOBLE have to offer the following very desirable plants as under; at the same time they beg to observe that they supply every kind of Nursery Stock, Catalogues of which can be had on application.

AZALEA INDICA, "GLORY OF SUNNING-HILL."—In general appearance this plant, when in bloom, reminds one of Nerium splendens, producing large double rose-like flowers of the richest pink; good plants, 3*s.* 6*d.* to 10*s.* 6*d.* each.

CRYPTOMERIA JAPONICA SEEDLINGS.

1 year ... ... 12*s.* per doz., or 63*s.* per 100.
2 years ... ... 18*s.* „ 105*s.* „
3 years ... ... 30*s.* „ 210*s.* „
1 foot 6 inches to 2 feet 6 inches high, 60*s.* per dozen.
2 feet 6 inches to 3 feet 6 inches high, 90*s.* „
3 feet 6 inches to 4 feet 6 inches high, 126*s.* „
And larger plants in proportion.

The whole of the above, with the exception of the one and two years seedlings, were planted into the open border last spring, are fine robust specimens, and fit for immediate planting.

CRYPTOMERIA JAPONICA var. NANA, a very singular dwarf variety, 10*s.* 6*d.* to 21*s.*

CUPRESSUS FUNEBRIS, or WEEPING CYPRESS. (North of China.)

6 inches high, 10*s.* 6*d.* each; 12 to 15 inches, 20*s.* each.
These plants are from the open border—robust specimens fit for immediate planting.
15 ins. to 24 ins., 31*s.* 6*d.* each; 24 ins. to 30 ins., 42*s.* each.

CUPRESSUS GOVENIANA. (California.)

6 to 9 inches, 7*s.* 6*d.* each; 9 to 15 inches, 10*s.* 6*d.* each.
15 to 24 inches, 20*s.* each; 2 to 3 feet, 31*s.* 6*d.*

CUPRESSUS LAMBERTIANA, 2 feet, 3*s.* 6*d.* each.

CUPRESSUS THURIFERA, var. ELEGANS, perfectly hardy.
1 foot to 2 feet high, 3*s.* 6*d.* to 5*s.* each.

CEPHALOTAXUS FORTUNII, strong plants, 31*s.* 6*d.* each.
For description, see "Botanical Magazine," by Sir W. Hooker.

FORSYTHIA VIRIDISSIMA.

1 foot 6 inches to 2 feet ... ... 1*s.* 6*d.* to 2*s.* 0*d.* each.
2 feet to 3 feet ... ... „ 2*s.* 6*d.* „
3 feet to 4 feet ... ... 3*s.* 6*d.* „ 5*s.* 0*d.* „
Fine bushy plants from open border fit for immediate planting.

JASMINUM NUDIFLORUM ... ... 1*s.* 0*d.* each.
Flowering plants ... ... 3*s.* 6*d.* „
This is a very desirable winter flowering hardy plant, producing a profusion of flowers of the richest yellow from December to February.

QUERCUS SCLEROPHYLLA. (North of China.) This is undoubtedly the most remarkable of all evergreen Oaks, having foliage as large as the Spanish Chestnut, and more than twice the substance. Strong seedling plants, 42*s.* each.

QUERCUS INVERSA. (North of China.) Also evergreen, with smooth entire leaves, having remarkably large male inflorescence. Seedlings, 42*s.*

TAXODIUM SEMPERVIRENS.

1 foot to 1 foot 6 inches ... ... 2*s.* to 2*s.* 6*d.* each.
1 foot 6 inches to 2 feet 6 inches ... 3*s.* 6*d.* to 5*s.* „
3 to 4 feet ... ... 7*s.* 6*d.* to 10*s.* 6*d.* „
Larger in proportion.

VIBURNUM PLICATUM. (North of China.) A noble shrub, producing in great profusion large globular heads of flowers of the purest white. Strong plants, 21*s.* each.

WEIGELA ROSEA.

6 inches high ... ... 1*s.* 0*d.* each.
1 foot to 1 foot 6 inches ... ... 1*s.* 6*d.* to 2*s.* 6*d.* each.
1 foot 6 inches to 2 feet ... ... 3*s.* 6*d.* to 5*s.* 0*d.* „
These last are fine bushy flowering plants.

Selections of the finest Autumnal Flowering Roses.

Standards ... ... 15*s.* 0*d.* per dozen.
Half Standards ... ... 12*s.* 0*d.* „

N.B.—Messrs. Standish and Noble have a large quantity of very fine common Laurels, from 2 feet to 6 feet high; also Spruce Fir, from 2 feet to 4 feet high; which can be sold very cheap, particulars of which can be had on application.

Bagshot Nursery, Oct. 5.

KITLEY'S "GOLIAH" STRAWBERRY, 3*s.* 6*d.* per dozen, or 1*l.* per 100.

CUTHILL'S "BLACK PRINCE" STRAWBERRY, 2*s.* per dozen, or 10*s.* per 100.

For descriptions of the above excellent sorts, see late Numbers of this Paper.

		Per 100.			Per 100.
Myatt's Eliza ...	...	3*s.* 6*d.*	Cooper's Seedling	...	3*s.* 6*d.*
„ Mammoth	...	3 6	Elton	...	3 6
„ British Queen		3 6	Keens' Seedling	...	3 6
„ Globe ...	...	3 6	Cole's Prolific ...	...	3 6
„ Prolific	...	3 6	Deptford Pine ...	...	3 6
„ Victoria	...	3 6	Roseberry ...	...	3 6

All the above are excellent sorts, and can be highly recommended.

All orders above 2l. carriage free to any station from Plymouth to London or Gloucester.

Apply to William E Rendle & Co., Nurseryman, Plymouth.

*** Our Autumn Catalogue of Forest Trees, Fruit Trees, and Shrubs will be ready in a few days.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

GEORGE JACKMAN, Nurseryman, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 5, 1850.

For a long time past, a Mr. John Roberts has been attempting, by means of advertisements, circulars, private applications, and epistolary persecution, to impress upon the public mind the very great importance of certain pipes, tiles, sockets, and so forth, which he has "registered for horticultural purposes." A short notice of these was published in our columns on the 29th of Sept., 1849, on which occasion it was stated that they might be worth a trial, by persons regardless of expense; but that *two hundred and eighty-nine pounds* per acre was rather a large sum to pay for a contrivance to grow Strawberries.

Since that time we ourselves procured some of the Strawberry tiles, whose excellencies were such as to justify an outlay of the magnitude above described; and we had the opportunity of seeing them under trial by others. The result was unfavourable; we found them disadvantageous rather than useful; and therefore on the 3d of August last, in pointing out a method of Strawberry growing which we had found economical and excellent, we presumed to use these words:—"We think a plan like this far preferable to Mr. Roberts's tiles, or to any contrivance for growing Strawberries on the level ground. In the first place it is cheap instead of dear; then it looks well instead of being ugly; thirdly, it harbours no vermin; and, moreover, it allows rain-water to soak easily into the whole mass of rich materials of which the bed consists." (p. 483.) Beyond this we made no remark. A few days afterwards we received from Mr. Roberts a letter, printed at p. 514, among the advertisements, charging "us, or some of our friends, *with having a large stock of burrs to dispose of*." We should have passed this over without further notice, as a piece of mere impertinence from an ignorant man, had it not been for what we are now about to relate, and to which we feel it necessary that public attention should be drawn.

On the 31st of August a correspondent, writing under the name of "Fair Play" (p. 550), after stating his dissatisfaction with these tiles, added that he had discontinued them, except as snail-traps, &c., for which purpose they are useful. A week later, Mr. Cuthill, a market-gardener at Camberwell, confirmed this assertion (p. 566), adding that no contrivance "for catching slugs and other insects in kitchen-gardens, and especially among Strawberries," would be found to succeed better than Mr. Roberts's tiles. The result of this was a lawyer's letter, addressed, on the 10th of Sept., to Mr. Cuthill by Mr. Charles Wellborne, of 31, Tooley-street, Southwark, from which the following is an extract:

"My client, Mr. John Roberts, has brought me a paragraph, written by you, commenting upon his celebrated Strawberry tiles in a most unjust and false manner, with a view clearly (for some wicked purpose or other, best known to yourself) to destroy the sale of such tiles, and thereby to greatly injure and damnify my client. Now, I am told you had the impudence to tell my client to his face that you had prevented one gentleman from buying his tiles by your malicious falsehoods promulgated with respect thereto, &c., &c.—I therefore have to say, that unless a full and ample apology *be inserted by you in the 'Gardeners' Chronicle' Newspaper*, to be published *next Saturday*, for your false and unjustifiable remarks relative to my client's tiles, and also a like apology be made to my client in writing, an action at law will certainly be commenced against you for recovery of damages already sustained, or which may be hereafter sustained, by or through your unjust and false remarks made about my client's Strawberry tiles."

On the 14th Sept., Mr. Doubleday, of Epping, presumed to express an unfavourable opinion of these tiles (p. 581), a couple of hundred which he had purchased having proved useless. On the 17th Sept., Mr. Doubleday received by the post a letter of which the following is the concluding paragraph:

"If you cannot employ yourself better than in writing such nonsense (to say nothing of what is worse), I think you are truly pitiable; did I not suppose it ignorance, I should take other steps to set you right. John Roberts."

Along with this was a newspaper slip, dated Sept. 9, in which the Editor compared Mr. Roberts to the late Mr. Thomas Andrew Knight! Shortly before the arrival of Mr. Roberts's letter, Mr. Doubleday received also through the post the following anonymous sentence. "See *Gardeners' Chronicle* of to-day (Sept. 14), which plainly shows you to be a cobbler, and not a *practical* gardener." This communication, although anonymous, was in a handwriting which is undistinguishable from that of one Holmes, an agent of Roberts.

At p. 614, Mr. D. Kidd, the intelligent gardener at Garnstone-park, near Hereford, expressed an unfavourable opinion of these tiles, of which he had made full trial, and forthwith Roberts dispatches an insolent letter to Mr. Kidd, and another letter of complaint to his employer. What sort of folks he supposes gardeners to be, that he hopes to dragoon them into silence we cannot tell; but we feel it our duty to protest against this most insolent attempt, firstly, at forcing them to purchase what they find unserviceable; and, secondly, at bullying them into a dishonest silence.

While this person complacently accepts every statement which he can obtain in favour of his tiles, he charges us and others who dislike them with falsehood, misrepresentation, and ignorance—especially ignorance of gardening. It happens that his tiles have been tried in the Garden of the Horticultural Society, by Mr. Thompson, the Superintendent of the Fruit Department; and we now republish his report upon them, dated June 28.

"These tiles are each about a foot in length and six inches wide. Two edges are turned down square; and on these turned down edges alone the tile rests on the ground, leaving between the latter and the under surface of the rest of the tile a clear space of an inch and a half. The ends are not turned down, so that when these are placed against each other, the cavity may be said to be continuous. A semicircular opening is cut out of one side of each; and a couple being placed, one on each side of the plant, a circular hole is formed for its growth, and the foliage and fruit can spread over the one-foot square platform constituted by the two tiles. Plants of Keens' Seedling, British Queen, and Old Pine Strawberries were planted under equal circumstances last autumn, in a row on the border in front of a south wall. When planted, tiles were placed round 80 plants of the above varieties; to the remainder, left for comparison, nothing was done. The weather was hot and dry when the fruit was ripening, and ripe fruit was quite as soon gathered from those plants which were not surrounded with tiles as from those that were. It was observed in many instances, that where the fruit rested on the tiles, the part in contact was pale, showing that the ripening process was not uniform throughout, consequently the flavour was not found superior to that of others grown in the most common way. The produce on the whole was inferior; for it must be obsered, that the tiles afforded excellent shelter for many insects, some of which attack the plants, others the ripening fruit; in both ways deteriorating the crop. These tiles might be employed in particular cases where straw, or the more enriching litter employed by market gardeners and others, would be considered unsightly, even though bleached by sun and rain. The cavity is bad, for the reasons above stated. Were it done away with, or, in other words, if the straight side were left as it is, at right angles with the top, and with the semi-circular opening, but no edge turned down on the opposite side, then the soil or other top-dressing could be raised round the plants, and on it the tile could rest and form a straight edging where desirable. All that can be said in favour of the tiles in question is, that they keep the fruit clean from soil. But, on the other hand, they prevent the rain from refreshing the roots, and thus prove injurious to the health of the plants, whilst they also harbour insects that spoil the fruit."

We make no comment upon these statements. They show conclusively what is to be expected of Mr. Roberts's Strawberry tiles, and also what is to be expected from Mr. Roberts himself by those who have the misfortune not to agree with him;

especially if they venture to make their experience public for the information of their neighbours.

And now let us ask WHO is this Mr. ROBERTS, the eminent horticulturist, the philosopher whom his scribes place by the side of the great ANDREW KNIGHT (!), the experienced cultivator who tells gardeners they know nothing about their trade, and who has found out the way to grow "Strawberries, Grapes, Peaches, Melons, and other fruits," together with "Celery, Asparagus, and other vegetables," as Strawberries, Grapes, Peaches, Melons, Celery, and Asparagus were never grown before—by only just using his tiles, sockets, pipes, and pots? This great personage is set down in the Directory as JOHN ROBERTS, 34, Eastcheap, *wholesale spice dealer.*

WE have been enabled, through the kindness of a friend near Bristol, to ascertain that the FUNGUS which proved so fatal there was not any species of Agaric. The boy who survived said that "they were things as if with pinholes underneath," which indicates some species of *Boletus*, a genus containing some of the most dangerous as well as the most delicious of fungi. Since this fatal occurrence, it is reported that serious illness has taken place from the use of Mushrooms purchased in the Bristol market, which perhaps may be the key to the query lately submitted to us respecting a sample of apparently good Mushrooms, about which it was said that there had been some controversy in the neighbourhood. Doubts indeed have frequently arisen respecting the safety of certain varieties of *A. campestris* and *arvensis;* and in some parts of England the latter is uniformly rejected by housekeepers, though the greater portion of the ketchup sold in the same districts is made principally from that species. It is curious, however, that the true Mushroom is in the present day but rarely used in Italy, where fungi form a very important part of the food, and where extremely doubtful and unpalatable species, such as *Agaricus melleus*, are consumed to a great extent. In the time of MICHELI all the varieties of *A. campestris* were much used at Florence, but though abundant in the neighbourhood, VITTADINI informs us that he never saw a specimen exposed for sale in the markets of Milan and Pavia, while at Rome it is expressly ordered that every Pratajuolo shall be thrown into the Tiber. Much credit cannot however be given to the degree of knowledge with which the prohibitory lists are drawn up in that country, when it is stated that the large orange-yellow gilled Mushroom, so much esteemed in Italy, passes under the name of *Agaricus campestris* in some of the lists, from a merely accidental juxtaposition in one of them.

The prejudice against our common Mushroom exists to an equal extent in some parts of Switzerland. The servants of an English nobleman, and amongst them the gardener who had, to the astonishment of the Italians, raised Mushrooms artificially in Italy, in passing through Vallais, found a large quantity of very fine *Agaricus campestris*, which, on halting in the afternoon, were cooked and eaten amidst the remonstrances of the peasants. The nobleman himself passing by a few days after inquired whether anything had been seen of the horses and servants. "Yes, my lord," was the reply, "but the men are certainly all dead by this time; for in spite of our warnings, they would eat Mushrooms."

Agaricus procerus is accounted an excellent article of food, and is sometimes sold in the London markets. This, however, like *A. campestris*, *arvensis*, and *personatus* has not escaped slander. Dr. LÉVEILLÉ informs us that in passing through Niévre he saved a whole family from imminent danger who were on the point of dressing a quantity of a large form of *A. clypeolarius*, which had been mistaken for it, and *A. rhacodes* is another dangerous species to which it bears a close resemblance. We can therefore not give full credit to the reports of fatal effects arising from the use of that species.

It is however, after all, possible that all the esculent species may, under rare circumstances, be unwholesome, though it is equally possible that some poisonous or unwholesome matter may have been present in all the recorded cases, wholly independent of the fungi. In PICO'S "Melethema," Supp. p. 8., a circumstantial account is published of many instances of the deleterious effects of the common Mushroom (Pratajuolo), and CROLLA has given a detailed description of a fungus which seriously affected nine persons, two of whom died, and which was clearly the common Mushroom. Dr. GREVILLE'S name would be a sufficient guarantee for the case of poisoning with *A. procerus*, reported in the "Gazette Médicale" for 1839, had *A. rhacodes* been distinguished from it at that period, which was not the case. *M. J. B.*

THE average fall of rain near London during 24 years (1826—1849), has been about 24 inches (24.017). The wettest year in the above period was that of 1841, when the amount of rain was 30.97 inches. The driest year was 1847, when there fell only 16.25 inches. The wettest month in the whole period was October, 1846, when we had 5.54 inches; and the driest month was December, 1829, when only 0.15 was indicated by the rain gauge. Even this was exceeded by March of the present year, when there fell only 0.13 inch.

The depth of rain which has fallen in the garden of the Horticultural Society, between the 1st of January and the 30th September of the present season, is as follows:

January	1.43	June	1.40
February	0.95	July	2.68
March	0.13	August	0.97
April	1.79	September	2.35
May	1.84		
			13.54

Hence it appears that we ought to have during October, November, and December, only 2.71 inches, supposing this to prove the driest season in 24 years; or 17.43 inches if it should be the wettest; or 10.46 inches if the amount of rain should reach the average.

HOW TO MISMANAGE A GARDEN.

CHAPTER IX.—Autumn and winter bring many more opportunities of bad management than some folks dream of. A few more may as well be at once recommended to the attention of the learner, so that he may think them over carefully before the time to profit by them shall have passed away.

Of course you will be just now planting out your Endive for winter use. True it is rather late, but as we said before, better late than never. Indeed it may be doubted whether there is not great advantage in having it as small as possible; there will be so much the less to blanch; and you may use thumb-pots or the next size for that purpose, instead of the great heavy expensive covers which large Endive requires. Your own intelligence will tell you that 20 small plants, covering a square foot of ground, are quite as much as one plant occupying the same space; just as a Vine with 50 half-pound bunches of Grapes is quite as remarkable a specimen of gardening as if it bore five bunches of 5 lbs. each.

When you tie up Endive for blanching, or if you do not tie it up, when you cover it take care that it is wet. Old-fashioned people prefer dry weather for this operation, and endeavour to keep it dry: but you will not imitate them. To be sure it may rot from wet, but then it may not; and if it does rot it will be more tender, that is to say more soft.

When you are earthing up your Celery, don't trouble yourself to do it gently, and with care; chuck the earth into the trench, a good shovelful at a time; it is sure to come right. As for the earth getting in among the leaves, why the cook can wash it out again; and if it should be rather gritty, in spite of the washing, why that is of no consequence, for you will not have the eating it.

It will be necessary, perhaps, to put your Raspberry beds in order. Be sure to prune out the young canes instead of the old ones; of course the bearing wood is what you want, and you may see by the remains of flowers that the old canes are what have been bearing the crop lately gathered. If they are weakish and rather dry, it will occur to you that they must have been exhausted by the young canes, and that if the young are removed the old will be strengthened. Good gardeners say that the effect of this mismanagement is to destroy the next year's crop: but if that should be so, you will have the satisfaction of looking to the chance of a crop the year after. Another thing you may attend to; dig well about the roots of your Raspberries; root-pruning is a very fine thing, as you know by its being so much recommended by Mr. Rivers; and what is good for a Pear must be good for a Raspberry. No doubt there is a difference between them; for Pear-roots are coarse, and woody, and naturally go down into the subsoil, while Raspberry roots are fine and fibrous, and lie near the surface. But what then? All mismanagers of any reputation know that a root is a root, just as a hand is a hand, and a mouth a mouth.

On no account will a bad manager break up the surface of his ground in winter. He sees no advantage in letting the frost in; why then take the trouble? especially when it makes a place untidy. As for slugs and other nuisances which a hard winter may kill, he can catch them in the summer time; it is good employment for a boy or two. He sees no use in having the soil broken down by frost, because it is sure to come together again in time. Instead of adopting so old a plan, he will sweep up all the leaves, and leave the ground nice and level, and hard, and neat; the harder the better, because it keeps the frost out. To be sure, Sandy Dinmont, who has the next garden, and who put his thermometers into the ground the year before, found that the hard ground was the coldest, and the broken ground the warmest; but a man may have enough to do if he is to mind such stuff as that.

Always roll the lawn when frozen; the Grass is brittle then, and will crackle under the roller; you may see that by the marks that are left where the roller has passed. This saves mowing; never mind the Grass being black, it will get green again in time, if it doesn't die. If the Grass should die, it will be easy to throw down some seeds, or to buy some more turf. *Κῆπουρος.*

HARDY FRUITS IN 1850.

HAVING often appeared in the columns of the *Gardeners' Chronicle* as the advocate of plans connected with fruit culture in the British Isles, based on principles so simple that the wayfaring man may readily understand them; I trust I may, as years roll on, be permitted either to bear increased testimony to the facts alluded to, or to sign my recantation when such becomes requisite. As to simplicity, I know not how it is; but one portion of the world — the gardening world I mean—seems to esteem a thing in proportion as it is elaborate or complicated. I much fear this is the larger portion. An horticultural "dipping in Jordan," such persons cannot comprehend, or do not appreciate.

In looking back on the memorable days when the "Gardeners' Magazine," conducted by the late talented and lamented Mr. Loudon, was in all its glory; or at least when hundreds of young aspirants for future horticultural fame gloried as the period came round for devouring a fresh number; I cannot but reflect — that with all the fanfaronade of certain fruit doctors of that day—there has been little advance in the culture of our out-of-door fruits. In observing this, I do not mean to say that nobody but myself has advanced. I am not quite egotistic enough; for well I know of several, in various parts of the kingdom, who have, like myself, repudiated the fine *paper systems* of those days, and betaken themselves to principles more in accordance with the habits and constitutions of the trees in question.

Everybody knows that the season of 1850 has been very much abused in the fruit way—at least in our northern parts; and everybody knows also, that there appears some plea for this ungentlemanly procedure, inasmuch as in the last week of March we had a thermometer of 16° in this part of Cheshire; other persons quote much lower, but of this there is room for doubt, inasmuch as I have found that those who have had the least success quote the lowest thermometer. Our 16°, was however a real matter of fact; and I have testimony much higher than my own (if it were needed) to prove it. This then is certainly a serious case, and evil results might indeed very naturally be expected to follow from it; and so they have, in at least two-thirds of the gardens within half a hundred miles of where I write; and not only around here, but in our more southern counties, if half the complaints we hear are correct.

Now, I may be permitted to say, that the gardens here have been a complete exception. Apples are the only fruit which can be termed a partial crop, and this I do not wonder at; for last year they were fearfully overladen, a circumstance which is well known of itself to induce a partial rest for a season. Plums, Cherries, Pears, Peaches, Nectarines, Strawberries, Raspberries, Gooseberries, with red, white, and black Currants, have all produced full crops; so full indeed, that I may probably never again witness such a fructiferous season, taking them both individually and collectively.

But now for the reasons. Is the season alone to blame for the numerous failures? Do all parties fully understand, appreciate, and carry out the one fundamental principle of ripening the wood? Here lies the real gist of the subject; and until this question is *thoroughly* comprehended, so long shall we hear of "horrible seasons," "cold blasts," "bad localities," "bad soils," "blights," "damp districts," and all the host of fruit evils, for the crimes and devastations of which a very broad margin is always left in the fruit book.

It is well known what a fuss has been made about the covering or non-covering of fruit blossoms; and how Drs. Tweedledum and Tweedledee have been knocking their heads together; which said craniums, being somewhat of the pumpkin character, have of course made a great deal of noise. These doctors never fairly settled this affair; but like most other angry disputants, left off with the chains of their prejudice faster riveted than ever.

Let us put a case; a gardener, we will say, who in the month of January succeeded to a situation in which his predecessor happened to be a deep border man, and a rich soil man; let us also add, that instead of paying attention to the removal of all shadowy and waste spray, during the period, when alone the foundation of good "setting" could be laid, he depended on those neat-looking systems of winter pruning (which appeared so smart on paper), for carrying out his object. Does any good gardener suppose, that by covering *alone*, a crop of fruit could be secured? And if he failed after the application of sundry yards of bunting or canvas, is it sound logic to charge the failure on the covering principle? Well, thus hath the argument been conducted in the main, and it is high time that common sense was infused into the question; and that fact should rule instead of hypothesis.

I do not by any means intend to say, that our tender fruit-trees will not produce crops *without* covering; all

I contend for is, that coverings judiciously managed re capable of rendering much service; like all other matters, the use and the abuse are two very distinct affairs.

In regard to their use, I would here respectfully urge on all parties interested in the discussion, the importance of using coverings, not only as protectors, but as retarders; that is to say, by a timely use, to cause the trees to blossom later than they would do without it. Surely, no one will deny that, as spring advances, every week lessens the chances of adverse weather, or, at least, of those intense frosts, which occurring in March, and even April, at once astonish and alarm. I here speak of the average of seasons; no one season may be allowed to settle this case. Every old gardener can bear testimony to the power of the sun acting on a south aspect, occasionally, early in February; so great is the extreme thus suddenly occurring at times, that I once knew a gardener confined to his bed for many weeks by a fit of ague or intermittent fever, brought on, (as said the doctor), by the sudden change. The person in question, told me that, having a dark coat on, he felt the heat strike to his chest as he was pruning Apricots against a south wall; the period, if my memory serves me, was about the beginning of March. I name this, by the way, merely in confirmation of the fact before alluded to, and to show that such sudden vicissitudes, which are so frequent in our climate, are a positive injury; and that it is far better to keep the tree in a quiet equilibrium until spring has advanced a little, and the soil has again begun to borrow heat from the atmosphere.

I have been a great advocate for both early made wood, and early ripened wood; and those who may remember how strenuously I have contended for such during the last half score of years, will no doubt at once think that I am "blowing hot and cold." "What!" Mr. A. will say, "first contending for early shoots, and then next, all for retarding; who can reconcile such contradictory advice?" I can, Mr. A., assuredly. That part of the wood which is excited thus prematurely is not the first to produce the best early bearing wood for the ensuing year, inasmuch as it is confessedly liable to blister and all the various checks consequent on a stagnated flow of sap. Besides, the retarding here spoken of, if it retard the wood-buds, does not interfere with an early root action. The root should be thrown somewhat in advance of the branches, a doctrine now recognised by all our best cultivators, and confirmed by practice as being of great importance. Although such may appear to apply mainly to the Peach, Nectarine, and Apricot, it will be found to bear as well on our tender Pears, and indeed most of our trained fruit trees. I therefore advise that the covering be applied very early in February; and that when the blossom-buds *will* burst, the covering be removed almost daily; not fearing what are termed cold winds, but merely warding off severe frosts.

After all, however, the ripening of the wood is the great secret; without this all will be futile; with it, all is tolerably easy. It is not necessary here to explain over again how this is effected; enough has been said on that head. Suffice it to say, that shallow borders with dry bottoms, a due attention to summer stopping or finger and thumb work, and the occasional use of top-dressings, are amongst the principal agents. *Robert Errington, Oulton Park, Aug.* 26.

VILLAGE EXCURSIONS.—Letter II.

In my last I prefaced the remarks I have promised you about "Village Excursions," by glancing at some of the considerations which have gradually led up to my introducing them, as one of the best methods for encouraging general, social, and friendly intercourse. Various methods are now in vogue; some of them appear to me too partial in their application for this object, though serviceable so far as they go. I believe we are all agreed, that the stability of our social scheme is more likely to be secured by the encouragement of mutual good-will between all classes of the community, than by any amount of police, or other extraneous force. I shall presently have occasion to contrast one of the old (but to me bygone), schemes for bringing together men of different habits, pursuits, and degrees, with the plan now under consideration. But I must here refer to the causes which more immediately induced me to propose our first excursion two years ago.

There is a benefit society for the labouring population established in this part of the country, whose members meet annually at distances of 9 and 16 miles from this village, on alternate years. These distances make it inconvenient to many, and even impossible for some members to attend these anniversaries. Being one of the directors of this society, it occurred to me that I could arrange a holiday for such of my own parishioners as were members of it, at no greater expence to them than they would have to incur at the anniversary dinner. I invited any of the party (they were then about 40 in all), to accompany me to the Ipswich Museum, giving each of them permission, also, to nominate a companion. Two or three of the farmers asked to be allowed to join this party. We visited the Museum, and inspected the extensive iron works of the Messrs. Ransome; all returned well satisfied with the treatment they had experienced. The orderly behaviour of the entire party was so perfectly satisfactory during the whole of this somewhat experimental trip, that I determined the following year to extend our operations. All who had been of the first party were now invited, each with permission to nominate a companion. I retained a *veto* in issuing the tickets, but found no occasion to exercise it in any case where application was made to me according to the prescribed rule. We were joined on this occasion by several of the farmers, to whom the good conduct of the party on the previous year had been reported. Our party now had reached to 170, including members of my own family, and all my servants. The proposal was to visit Harwich, and to take a peep at the sea. The party were not prepared for all they had to expect. Scarcely any of them had ever seen the sea, or been in a boat. Dread of the water was a predominant feeling, and some of the more faint-hearted staid at home from this cause, though longing to join us. Even the railway was a novelty to several, and there was much whistling and shouting provoked on immerging into the darkness of the tunnel.

On this occasion the plan of our trip from Ipswich to Harwich had been arranged and mainly provided for by members of the committee of the Young Men's Association at Ipswich. They had cleared out a warehouse by the river-side, in which they received us to breakfast; and then put us into a steamer profusely decorated with flags, and having on board a good band of music. After the usual amount of trepidation on crossing a plank for the first time, laid from the shore to the boat, all fear of the water soon subsided, and never did novices to such methods of locomotion apparently enjoy themselves more thoroughly. The foam raised by the paddles was an object of quiet wonder; but one young lass was inquisitive enough to ask, "Is it hot water?" the appearance, no doubt, reminding her of the wash-tub. Permission having been previously secured to inspect the arsenal and fort, we were received on the quay by the party who had readily granted this indulgence; and I must remember, when I come to sum up some of the requisites for securing success to these excursions, to allude to the importance of obtaining the assistance and countenance of persons at a distance from the starting point. After inspecting boarding-pikes, cannon, and other materiel to "make fighting," we adjourned to the cliffs at a short distance from Harwich, where we had also secured permission to assemble in the private grounds of a gentleman, where we attacked some frugal fare. This essential matter discussed, we returned in a body to Harwich, accompanied by the band, and graced with the presence of ladies, who seemed to be not less pleased with the adventure than the gentlemen of our party.

The perfect success of the day encouraged me to carry out a somewhat radical reform in part of our village economics, which I could not expect would be received at first with universal favour among the farmers, though I felt sure it would meet with the approbation of some, and I have confidence in believing it will be acknowledged in the end to be a decided improvement by nearly all.

In my last letter I alluded to the old-fashioned tithe audit dinner of a bygone system. In many parishes this dinner has been dispensed with ever since the Tithe Commutation Act has taken effect. Several clergymen have gladly availed themselves of the opportunity of abolishing an old custom which, in many cases, placed them in a somewhat equivocal and anomalous position, as presidents over parties which often ended discreditably to one, two, or more of the guests. It had become the established rule at such annual "frolic" in this village, to allow wine to the extent of one bottle per head (the party averaging not much below 40). As several never thought of drinking more than a reasonable quantity, a portion of their share was thus left to be consumed by those who are never backward in drinking to any extent that may be freely allowed them. Still I was unwilling to abolish an old custom which (however abused) afforded us an opportunity of meeting in friendly intercourse. It now occurred to me, that I could secure this object in a far better manner by appropriating the sum which these somewhat unsatisfactory "frolics" cost me, towards a fund for carrying out such excursions as double experience had proved to be grateful to those who had tried them.

The third excursion, to which you have so lately referred, was founded upon this policy; and the result has proved perfectly satisfactory to myself, and, I may add, to every one who accompanied me. No doubt all good things may be abused, as well as tithe audit-dinners; and these excursions may admit of abuse, like everything else. But the means of preventing abuse, and of correcting abuse, lie more within our own power, when a few precise rules and restrictions are laid upon those who consent to associate with us on these occasions. And then what a difference between presiding at a table where three dozen of wine have to be discussed by three dozen guests, in a close, hot room, amidst clouds of tobacco-smoke (to say nothing of the fumes of beer and brandy), and finding oneself associated with a joyous party in the open air! A distant whiff from an occasional cigar of some determined smoker, can scarcely offend the most fastidious nose. Where the maximum allowance is two pints of beer (diluted with a sufficiency of milder potations), there is no risk of intemperance, even with those whose throats are least under self-control. I need not say anything in detail respecting our last excursion, as you have picked out some of the plums, and redressed them "*more tuo*" for the amusement of your readers; and I will reserve what I have further to say concerning the mode of planning such village excursions, so as to make them profitable to all who are not predeterminately disposed to be ill humoured, or are above believing that such occasional "fusions" of all degrees and parties, can tend to better things than to "confusions" in our social relations. *J. S. Henslow.*

VILLA AND SUBURBAN GARDENING.

In the course of his gardening pursuits, the want of proper nourishing soil is often severely felt by the amateur; and it occasionally happens, that such can only be procured at great expense, and with much difficulty. It is the want of proper material which too frequently defeats his object, and damps his ardour. It sometimes happens, however, that the very compost he requires is at hand, but is neglected. He forgets that he has a heap of decaying weeds, that he has quantities of Gooseberry prunings, Raspberry prunings, the rakings and dead wood of his shrubbery, and that these are a nuisance, which is daily increasing. What to do with them puzzles him; the expense of carting a large heap of them off his confined premises, is considerable; but something must be done with them. This is a dilemma in which scores of amateur gardeners are placed. They do not know that Couch and refuse cuttings and prunings are convertible into the very kind of material they most require in the great bulk of gardening operations. Permit me, therefore, to state how this knowledge is to be improved by them.

Suppose, for example, that we find in an amateur's refuse corner a year's accumulation of rubbish. Let a space near this heap be cleared just sufficient to ligh a portion of dry materials, in order to form a foundation of burning matters, by which the whole shall, in process of time, be ignited, not with the intention of consuming the heap, but rather with that of charring it. When this is accomplished to the extent above stated, keep on adding rubbish, in order to prevent flames from bursting forth; but if not, smother the fire beneath. When the whole of the refuse is banked up, and ignition is proceeding slowly, but surely, look round the compost-yard, and collect refuse parings of turf or peat, the exhausted soil from pots, and cover the burning heap, so as to keep it in a smouldering state. It should remain in this condition until the whole mass has become charred through. During the process it will require occasional attention to prevent anything like flame. When it becomes cool, it will be fit for use—store it away, and look upon it as a prize of no mean value. It contains both chemical and mechanical virtues, in no small degree. If I recollect rightly, the late Mr. Andrew Knight held such a fertiliser in the very highest esteem; and well he might, for it would puzzle modern venders of quack medicines for vegetable debility to approach it in value even in the present day. *Pharo.*

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

In the Natural History Section a paper was read *On the Effects of Salt on Vegetation*, by Dr. Aug. Voelcker, Prof. of Chemistry in the Royal Agricultural College, Cirencester.—This paper contained the preliminary results of some experiments, undertaken with a view of studying the effects of salt on vegetation in general, and to determine more in particular in what quantity salt produces a beneficial and in what quantity an injurious effect on different plants. The plants selected for experiment were Cabbages, Beans, Onions, Lentils, Stellaria media, Senecio vulgaris, Carduus pratensis, Anthoxanthum odoratum, Poa annua, and Radishes. They were all grown on the same soil, of a calcareous character, and potted on the 1st of May, and experimented upon with salt solutions of different strength on the 10th of May. The following are the general results derived from these experiments. 1. Salt solutions, containing 3 grains of salt, 6 grs., 12 grs., and 24 grs. of salt, produced no injurious effect on the above-mentioned plants, which had been regularly watered with them during two months, with the exception of Anthoxanthum odoratum, which was killed by a solution containing 24 grs. of salt, in the course of a month. 2. Such weak solutions appeared to benefit most plants experimented upon, particularly Cabbages, Radishes, and Lentils. The Lentils, which were watered with a salt solution, containing 24 grs. of salt per pint of rain water, were nearly one-half larger in size than those watered with 6 grs. of salt per pint; and these, again, were more vigorous than the Lentils, which received no salt at all. 3. Salt solutions, containing 48 grains of salt, proved to be prejudicial, in the course of a month, to Lentils, Stellaria media, Senecio vulgaris, and Poa annua; and exercised no injurious effect on Cabbages, Beans, Onions, Radishes, and Carduus pratensis. 4. Salt solutions containing 96 grains of salt had an injurious effect on Lentils, Stellaria, Senecio vulgaris, Poa annua, Cabbages, and Beans; but no effect on Carduus pratensis, Onions, and Radishes. 5. Cabbages will continue to grow, though sickly, when watered regularly during a month, with a salt solution, containing 192 grains of salt, and even when watered with a solution containing 382 grains of salt per pint. 7. Solutions of salt, containing 192 grs. of salt per pint, proved unprejudicial in the course of a month to Onions. 8. Grasses are affected by salt more readily than any other of th plants experimented upon. 9. Solutions, containing 27 grs. of salt, decidedly benefited Radishes, Lentils, Onions, and Cabbages. Many of the plants had taken up so large a quantity of salt that they tasted like strong brine, and, notwithstanding, they grew healthily, which evidently shows that salt, in a moderately-diluted solution, has no poisonous effect on many plants. In con-

clusion, the author mentioned that his experiments differ from those of Mr. Randall, made with Fuchsias But as Mr. Randall used a water from a particular source, and not pure salt water, and may have contained other poisonous substances, it is the opinion of the author that so small a quantity of salt as that contained in the water with which Mr. Randall experimented, cannot be regarded as the cause of the observed poisonous effects.—Professor Balfour stated that some of the plants referred to by Professor Voelcker were naturally sea-side plants, and no inference could be drawn from them, he thought, as to the influence of solutions of salt on their growth.—Professor Walker-Arnott said that many plants would bear large quantities of salt that were not especially sea-shore plants. Thus, Poa annua would grow and flourish at the edge of the sea. He knew for a fact that the seeds of plants which had grown by the sea shore, and which were not naturally maritime plants, would germinate and produce plants which would bear larger quantities of salt than those which were produced away from the sea.

Home Correspondence.

Couve Tronchuda, or Portugal Cabbage.—It is stated in your Paper of the 14th ult., p. 581, that the Couve Tronchuda does not heart. I beg leave to assure you that it does heart; and it has hearted with me, and also with those other amateur gardeners near this, who have been so fortunate as to obtain some plants of the true sort, raised from seed sent by Dr. Lindley to a gentleman, a friend of his, and a neighbour of mine, some years since; and from which plants I have saved excellent seed, and do so every year, by merely protecting the plants from frost during the winter months, under (a Melon frame, not otherwise than required. I consider that I have in some degree acclimatised this most excellent and delicious vegetable, and that it is now more capable of enduring hardship than the first year I had it. I then lost nearly half of the plants under the frame, and now I do not lose one in twenty, and the Cabbage is equally good and pure in every respect as the first year I had it. I believe that there is not much of the genuine seed of this Cabbage to be purchased in Britain, and that an hybridised article having been sown, has induced some persons to believe that it does not heart. The seed should be imported from Lisbon direct. It grows near and about Braganza. *Mediensis, Ireland.* [We can assure our correspondent that he will be disappointed if he procures Couve Tronchuda from Portugal. As to hearting, our observation was made with reference to the solid hearts of ordinary Cabbages. It hearts, no doubt, but loosely.]——I have to thank you for your insertion of a letter I addressed to you a short time since upon the subject of losses I had experienced in my horticultural operations, and your remark at the close of the letter was certainly very judicious, viz., "that all amateurs should provide themselves with some book on routine gardening;" but can you tell me where such a work is to be met with as will give the information my letter sought? I have Loudon's "Encyclopædia of Gardening," Abercrombie's "Every Man his own Gardener," Paxton's "Cottagers' Calendar," and Rennie's "Alphabet of Scientific Gardening;" but none of them give the description of the vegetables in the form when fit for food. Loudon comes nearest to the point required. I have however met with the matter I sought for, but in a work in which it would least be expected to be found; and, for the benefit of others, I transcribe it. It will be found in the "Encyclopædia of Domestic Economy," by Webster and Parkes: "2426. The Couve Tronchuda (Brassica costata) or Portuguese Cabbage, from Tranxuda, Portugal, is much cultivated on the Continent, and was introduced here in 1821; it is grown chiefly for the midribs of the outward large leaves, which, when divested of their green parts, and well boiled, make a good dish, somewhat resembling Sea-kale. The heart, or middle part of the plant is, however, the best for use; it is peculiarly delicate, tender, and agreeably flavoured, without any of the coarseness which often belongs to the Cabbage tribe." It would, I think, be well if our writers upon horticulture would take a lesson from this, and precede every article the culture of which they undertake to instruct in, with a description of the article itself. Medical men in their elementary treatises of diseases, in the first place describe them, and point out the features by which they are to be distinguished from any other similar disease, before they begin to prescribe the remedies or mode of treatment. Such should be the treatment of horticultural subjects in an elementary work. But where will you find the distinction pointed out between the Cauliflower and Broccoli? I remember nowhere, except in this said work of Webster and Parkes, and here I fell upon it by mere accident. Let Mr. M'Intosh take a hint from this in any new edition of his work he may publish. *A. B. C.* [The difference between Broccoli and Cauliflower has been fully pointed out at p. 299 of our volume for 1846.]

Potatoes.—I have just completed taking up my Potatoes, and I have not found more than one or two diseased in each bushel. They were planted in February, part on ground broken up from Grass, the turf dug in last year, and planted without manure. This year a light dressing of half rotten leaves was put in the drills on the sets, which were then covered with about 5 inches of soil. The crop was light, but the Potatoes were large and mealy. I had some ground that has been planted several years with Potatoes, without manure, dressed with manure from the cow-yard, and dug in last November; it was afterwards planted in February with early sorts. The crop was undiseased, abundant, and good in all respects. The tops of all the Potatoes in this neighbourhood were attacked with a black speck on many of the leaves on the 3d of August. The disease spread from leaf to leaf, slowly, until all were destroyed, leaving the principal stalks almost uninjured. Our soil is a strong clay, but in other soils the result is nearly the same. The following may be taken as the report of this neighbourhood for several miles round, viz., light crops, large Potatoes, and good in quality. For the last three years our ground has not produced one half sound Potatoes on an average. The extreme dryness of the summer has been greatly in their favour this year; they have not been soaked to the roots since April. But, while the Potatoes have been benefited by it, Turnips are quite a failure; Grass is very scarce, and timber trees are shedding their leaves at least 20 days earlier than last year. I have tried diseased Potatoes for sets in alternate rows with sound ones, from the same lot for the last two years, both cut and uncut. The result has been that, while some of the diseased sets grew, and produced a good crop, others came to nothing. In 1849 the sound sets produced as great a weight of tubers in 8 yards, as the diseased ones did in 12 yards, and this year as six to nine; quality alike in both cases. I have found Soden's Early Oxford superior to about 20 other sorts; Forsyth's Early Coloured is a good cropper, but the eyes are deep, and there is much waste in preparing it. *H., Ludlow.*——My Potatoes were attacked with disease, as usual, about the third week in August, and in a few days every top was destroyed. I directed my gardener to keep three rows of Thurston's Conqueror of equal length, distinct from the rest, and to leave the tops on one row; mow them off the 2d, and pull them up on the 3d. The following is his statement of the weight, taken up the first week in September: haulm left on, 37 lbs.; haulm pulled up, 33 lbs.; haulm cut off, 34 lbs. There were very few diseased tubers in any of the rows, and, he says, about equal. Of course the experiment is incomplete, as the diseased tubers in each row ought to have been weighed. The disease in this neighbourhood seems to be leaving the tuber and expending all its virulence on the haulm—how is this? I shall be glad to try the experiment of planting diseased and healthy sets in the autumn. Will you give us a short schedule, that the experiment may be tried by a great number upon the same model? *C. R. Bree, Stowmarket.*——I beg to forward you a sample of Potatoes taken up to-day, which appear to be very much infected with disease. They are called Neville's Defiance, an early Potato, which was planted in trenches covered with leaf-mould, without any other preparation of manure, the first week in November, the previous crops being late Peas after early Broccoli. They did not come up till the usual time, but they were cut down by the frost just after they had made their appearance. Since they have come up again they have all along appeared healthy, and, what is most remarkable, there is not the slightest indication of disease in the haulm. Owing to the dry weather the latter droops very much, but still it is in good health. Have you heard of a similar case? [No.] *W. J. Ward, Gardener, Prospect Hill, near Reading.*

Pelargoniums.—I have read with pleasure your description of the "Wilmore Surprise," which will, doubtless, prove an acquisition, and will certainly be something different from anything at present in cultivation. I wish we could rely as much on the descriptions of the so-called new varieties that are continually making a noise in the world; when once your half-guinea has been paid for a plant, it is mortifying to find it so much like some you already possess, that if you accidentally lose the name, you will take it for one of your old favourites, the flowers are so much alike. I have in my possession a single flower with 13 petals; when fully expanded it measured 3¼ inches across; it was not quite so good in shape as the other flowers on the plant, but nearly so. Unfortunately, I have not been able to get the plant, or the branch (which I struck) on which it grew, to produce me such another monster. I have a blue Cineraria raised from seed, which has two of its flowers quite double. I have removed all the single blossoms but one which has a few extra petals, and I hope I shall be able to ripen seed from it, and thus obtain a good addition to this favourite race of plants. *H., Ludlow.*——I saw an article in last week's *Chronicle*, on the Wilmore Surprise, by Mr. Rosier, of Brooklands Nursery, Blackheath, in which he supposes Mont Blanc to be the same thing as Album planum of Mr. E. G. Henderson's catalogue; fearing this statement may lead some into error, I beg to say that Album planum was grown, at the Wellington-road Nursery, at least two years before Mont Blanc was sent out, and is quite a different habited plant. Mr. R. does not mention that there are two distinct varieties of Mont Blanc, both of which were raised by Mr. Story, and sent out through Mr. Beck under the Nos. 1 and 2. The former (No. 1) is the variety that produces the semidouble flowers, and is of no value; the latter (No. 2) is an excellent Pelargonium, and worthy of being in every collection. *T. S. Somerville, Wellington-road Nursery, St. John's Wood.*

Incarvillea grandiflora.—Novelties in the way of Bignoniads being on the *tapis*, brings to mind a plant I saw a short time since, which, although not new, will be not the less available, it being one of the most lovely things I have seen of late, namely Incarvillea grandiflora. It is probably hardy in some parts of England, but it richly deserves the protection of a greenhouse in cold climates. I imagine that it is, like most of the family, a very shy bloomer; but when it does flower well it is really beautiful. *J. Cole, Oldford.*

The Proper Season for Planting Evergreens.—I believe that there cannot be a more mistaken practice than the common one, of planting evergreens at the same season as deciduous trees. However contrary to received opinion it may be, I do not hesitate to say, that the worst months for planting evergreens are December, January, February, and March; and the best, June, July, August, and September. Even in a dry summer, evergreens run little danger, if the planter will take the trouble of throwing a good souse of water into the hole before planting. *S. B., Dorking.*

Village Ignorance.—I will give you an illustration of village ignorance, and the manner in which it gives rise to popular error. A woman with a very vivacious manner brought to me on Saturday evening two very fine live chrysalids of Acheronta Atropos, which she found in her Potato bed in an earthy sort of nest. She had kept them for a day or two and fed them with Potato leaves, of which she declared they had eaten! Now, this is the sort of evidence from whence arises the hedgehog and viper stories of which we hear so much. This woman believed that the pupæ had fed upon the Potato-top, and thought she was giving me some useful information as to their future management. *B.*

Hoya bella.—This plant grows with me very freely, and produces abundance of flower buds, but they all fall off without expanding. Have any of your correspondents experienced the same defect, or can they suggest a remedy? My plant is growing in a pot in a cool Orchid house, with plenty of light and air, and moderate moisture. Other Hoyas flower under the same treatment, but it does not. I have lately removed it to a warmer house, but it is impossible for a plant to look more healthy than it has done in its former abode. It appears to differ in habit from Hoya carnosa, as the peduncle itself falls off after the buds have fallen, instead of throwing out fresh buds as that species does. This however may be peculiar to the unhealthy state of my plant. *J. R.*

The Willow-leaved Ixora (I. salicifolia).—A plant now in bloom here has a truss of flowers on it which measures 16 inches in circumference. I am much pleased with this Ixora, and I am sure, when it shall have become better known, it will be a greater favourite with the public, both for the purposes of exhibition and for private decoration. It appears to be "worked" on Ixora coccinea; but this is not a good stock for it, for we all know that the Ixora tribe throws up ground shoots, which renders them unfit for stocks. I have been obliged to remove several such shoots already; besides, this plant possesses as strong a habit as any of the others. Gardenia Fortuni, too, is often worked on G. florida and G. radicans, while the two latter are weaker kinds than the former. *D. Kidd.*

Societies.

Horticultural, *Oct.* 1.—E. Brande, Esq., in the chair. Sir R. Burdett, Bart., J. S. Leigh, Esq., and L. B. Foster, Esq., were elected Fellows. A Banksian Medal was awarded to Mr. Turner, of Slough, for an exhibition of Dahlias, consisting of large and exquisite blooms from plants that were stated to have been in flower for nearly two months. The sorts were as follows:—Duke of Wellington, Thames Bank Hero, Fearless, John Edwards, Magnificent, Earl of Clarendon, Richard Cobden, Mrs. Seldon (Turner), Essex Triumph, Queen of Lilacs (Turner), Mr. Seldon (Turner), Toison d'Or, Snowflake, Scarlet Gem (Turner), Seraph, Mynn, Queen of Primroses, Black Prince, Mr. Palmer, Rosea Alba, Grandis, Model, Miss Hawtrey, and Goliah; the last six being seedlings. The same grower also showed 12 fancy flowers, viz.: Belle de Nogent, Highland Chief, Mrs. Hansard (Edwards), Freund Schmidt, General Cavaignac, Gasparini, Nonsuch (Turner), Dulcinée, Rainbow, Mrs. Labouchere, Striata Perfecta, and Pretty Polly (Turner); the latter a seedling of considerable promise.—Mr. Bragg, of Slough, received a Certificate of Merit for "The Hon. Mrs. Ashley," a beautiful waxy-looking light seedling, tipped and shaded with rose. It is a flower of good form, but unfortunately possesses an imperfect centre.—J. Edwards, Esq., of Holloway, sent six blooms of his beautiful white-tipped yellow fancy seedling, named Mrs. Hansard; and Mr. Turner exhibited the following three seedlings, raised by Mr. Stein: Nil Desperandum, scarlet; Nepaulese Prince, shaded maroon—both fine flowers; and New Standard, a purple and white "fancy." Other florists' flowers consisted of 12 spikes of Hollyhocks from Mr. Bragg, for which a Certificate of Merit was awarded, and some nice looking Petunias from Mr. Gadd, gr. to T. Lenox, Esq., of Hammersmith. Flowering examples of the new Chilian climber, Lapageria rosea, were exhibited by Mr. Selkirk, gr. to W. J. Meyers, Esq., of Shenley, and by Messrs. Veitch and Son, of Exeter. It was stated to have been sent by Mr. Lobb, from "Conception," to the Exeter Nursery, where it has blossomed in a conservatory; but it is the opinion of Messrs. Veitch that it will prove hardy. They have found it to be a very free growing plant, but whether or not it will turn out to be a profuse bloomer remains to be seen. The blossoms, individually, are extremely handsome, and exactly resemble the published drawings of them both in shape and colour, except that the minute white spots which are represented as being spread over the interior of the crimson

bell were nearly wanting, or very indistinctly marked in the specimens shown, to each of which a Banksian Medal was awarded. Mr. Young, of Milford Nursery, Godalming, sent two plants in pots of Cryptomeria japonica about 3 feet high, loaded with young cones. It was stated that the Cryptomeria had ripened seeds at Strathfieldsaye, the seat of the Duke of Wellington, and that young plants had been raised there from them.—Mr. Franklin, gr. to Mrs. Lawrence, produced a collection of Orchids, consisting of Oncidium Papilio, Vanda suavis, Lælia Perrinii, Cattleya bicolor (with a highly-coloured lip), a Cycnoches from Costa Rica, and one or two other plants. A Knightian Medal was awarded.—Messrs. Jackson, of Kingston, received a Certificate of Merit for a nice exhibition of Odontoglossum grande, plants of which were stated to keep in blossom in a cool show-house, at the Kingston Nursery, for several weeks together.—Mr. Ingram, gr. to her Majesty at Frogmore, sent cut specimens of a seedling Heath, in the way of princeps, which promises to be well worth cultivating; also a beautiful example of the Prickly Cayenne Pine-Apple, weighing 7 lbs. 5 oz. It was somewhat unripe at the top; but every Pine-grower knows that it is difficult to get this kind of Pine-apple to ripen perfectly from end to end. A Large Silver Medal was awarded it.—Mr. Ward, gr. to W. Stephens, Esq., sent two Envilles and a Globe, whose weights were respectively 5 lbs. 2 oz., 4 lbs. 4 oz., and 4 lbs.; and Mr. Eckford, gr. to C. Child, Esq., of Bromley-palace, showed a small Queen which had been ripened out of doors. It was stated to have been planted out on the 14th of May last. Various Grapes were shown, among which was a sample of Black Hamburgh, from the large Vine at Cumberland-lodge, which was stated to have ripened this year a very heavy and fine crop. The bunches exhibited were rather above the average size and well coloured. Mr. Forsyth, gr. to Viscount Barrington, Beckett, near Shrivenham, had three beautiful bunches of Black Hamburgh, but a little rubbed by travelling, weighing respectively 2 lbs., 1 lb. 10 oz., and 1 lb. 7 oz. A Banksian Medal was awarded them.—Mr. Fleming, gr. to the Duke of Sutherland at Trentham, produced three bunches of Millhill Black Hamburgh, weighing respectively 1 lb. 10 oz., 1 lb. 9½ oz., and 1 lb. 6 oz., and a bunch of Dutch Hamburgh, 1 lb. 4 oz. A Banksian Medal was awarded to the Millhill, which is a large and finely flavoured Grape, quite distinct from either the common Black Hamburgh, or the old Dutch Hamburgh, which does not always become black, but is often of a flame or red colour. Examples of a different Grape, bearing the same name, to which a Certificate of Merit was awarded, were communicated by Mr. Ferguson, of Stowe. Mr. Agent, gr. to W. M. Webster, Esq., sent a large punnet of Black Hamburgh, not large either in bunch or berry, but very black, and beautifully covered with bloom. Well grown specimens of the same kind of Grape were contributed by Mr. Rust, gr. to J. Maclaren, Esq., of Ticehurst, Sussex. A Certificate of Merit was awarded them. Cambrian and Late Admirable Peaches were furnished by Mr. Meyers, of Brentford; and Mr. Budd, gr. to J. Reeves, Esq., sent a ripe fruit of the Egg Gourd (Cucurbita ovifera) which, in a ripe state, has the reputation of being an excellent winter vegetable.—From the Garden of the Society came Brassia brachiata, the new yellow flowered annual Microsperma (Eucnide) bartonioides, Pronaya elegans, Plumbago Larpentæ, a variety of Japan Lily, Niphæa oblonga, Manettia cordifolia, a tolerably gay plant at this season; Angelonia moschata, a rather handsome species; the little pale-green flowered Clematis graveolens, a suitable plant for rockwork; a hybrid Anemone, raised between A. japonica and the white Indian A. vitifolia; two species of Aphelandra; Boronia denticulata, a Cape Heath, and two fine specimens of the Siebold Sedum just coming into flower. The same establishment also furnished samples of the Barrington and Chancellor Peaches, two good late varieties.

Garden Memoranda.

Bowes' Manor, near Southgate, the Residence of the Lord Chancellor.—Since we visited this interesting suburban villa, in 1848, several improvements of importance have been effected in the garden scenery around the house, and further alterations are contemplated. On the north front, a considerable portion of the adjacent meadow has been converted into dressed ground, a broad gravel walk, straight and level, with a wide margin of Grass, has been formed along the side of the lawn, from the house towards the "New River," and the shrubbery at the extremity of the lawn, on this side of the house, is about to be broken up into clumps, with Grass between them, which will extend and improve the appearance of this part of the garden. A new entrance from the public road has been made nearly opposite the end of the house, whose seclusion is, however, maintained by throwing up a high bank of earth between the gate and the house, and planting it with evergreens, intermixed with Hollyhocks, Dahlias, scarlet Geraniums, the taller growing kinds of Calceolarias, and, towards the margin, Verbenas and Mignonette. A new shrubbery has been planted up the side of the boundary wall on the south front, and on the west side the courses of the walks have been greatly altered, fresh flower beds have been formed, and other improvements effected. The small kitchen garden on this side of the house is about to be added to the flower garden, its walls will be removed, and any portion of the glass erections worth preserving will be put up in the old kitchen garden, in which new forcing pits are about to be erected. The place, under the superintendence of Mr. Lindsay, is altogether gradually assuming a character which in time cannot fail to be highly interesting. The house itself stands near the middle of the dressed ground, with open grassy sward on one side, and a tolerably extensive lawn, with its lake, island, and flower-beds on the other. A rustic bridge over a narrow part of the lake leads to the island, in the centre of which is a secluded dell, furnished with a fountain and basin, and over-canopied with Roses and climbing plants, forming an agreeable and cool retreat in a warm summer day. A large vase placed in the water, between the house and the island, had a very ornamental appearance. It was filled with tall scarlet Geraniums in the centre, Salvia fulgens, the clear yellow Calceolaria viscosissima, and other plants, the whole being surrounded by Indian Cress, which hung over the side of the vase down near the water. Bedding plants have been very effective here this season. We remarked a large circular bed arranged in the following manner. In the centre was a mass of the scarlet Geranium compactum, then came a belt of Fish's dwarf variety of Ageratum cœlestinum; this was succeeded by Calceolaria Kayii, next which was Tom Thumb Geranium; the whole being finished off by Verbenas, Mignonette, and the little blue Lobelia gracilis. Some of the other beds were planted after the same fashion; but there were also many self-coloured ones, among which few made a better display than one or two which were occupied with Robinson's Defiance Verbena, which proves to be a capital bedder. Verbena Satellite likewise makes a good bed, as do also the Verbenas Duchesse Décazes, Rayii, Perfection, St. Margaret's, Hendersoni and Charlwoodii. A very good bed was formed by surrounding the old horse-shoe Geranium with Mangles' variegated. Through most of the beds Mignonette was largely sprinkled, adding fragrance to their beauty.

Miscellaneous.

Adelges Abietis.—This insect forms the cone-like excrescences on the Spruce Fir. The original matriarch lives outside the gall, remaining all winter in a dormant state at the root of the bud. As soon as the bud swells she revives likewise, and speedily becoming enlarged with the juice imbibed, she lays some hundreds of eggs about her. The bud meanwhile, instead of growing in length, becomes fleshy, and this fleshiness is communicated to the leaves. The result is an arrested bud, into the recesses of which, the young issuing from the cluster of ova on the outside of it beneath betake themselves, and become soon closed in during the growth consequent on the increased irritation occasioned by their presence in its interior. As to the alleged diversity of the species produced by the small rounded cones at the summit of twigs (Chermes coccineus, Ratz.), and those from the larger, more fleshy, and more oblong galls arising at the bases, or enveloped in the substance of shoots (C. viridis, Ratz.), the greater exposure to the sun is sufficient to give a deeper tint of colour as well as a more rapid evolution to the inclosed inmates. The difference assigned in the structure of the wing-veins quite eludes my detection. Those arrested individuals that pass the winter on the branches are perhaps the progeny of winged females, which are oviparous. I observe, also, that winged females of two other species are in like manner oviparous, viz., those of A. Laricis and A. corticalis. M. Macquart had long since remarked this fact in regard to A. Laricis, and felt persuaded that it was only the second generation whose winged females are in this condition. He considered it to be a Psylla, and being anomalous, proposed to form of it a new genus, which, not finding he had prefixed a name to, MM. Amyot and Serville, in attempting to supply the oversight, have called Cnaphalodes (Hemipt. 594, 595). The structure however of the larvæ of Adelges, as well as that of the mature insect, indicates that it follows the type of the Coccidæ rather than either that of the Psyllidæ or Aphidæ. *J. Hardy, Penmanshiel, in the Annals and Magazine of Natural History.*

On the Use of the Bark of Adansonia digitata in Intermittent Fevers, by M. Simon Pierre.—About two years ago M. Duchassaing, a physician at Guadaloupe, communicated to the Academy of Sciences the result of some experiments he had made with the bark of the Adansonia in intermittent fevers. The use of this bark he learned from the negroes, who constantly employ it in cases of marsh fever. Experiments have been made with this bark in Burgundy, where fever is endemic, and at the Hotel Dieu at Paris. The results have been so satisfactory that I think them deserving of the attention of the academy. Having taken cases in which fever was severe, and had not been overcome by sulphate of quinine, the patients were cured, and that completely, by the use of the bark in question. I have been able to make but seven observations, my stock of bark being consumed. In all the circumstances in which I have applied this remedy, the attacks of fever were clearly marked, and of different types. Of the patients, some lived in Burgundy, some came from Africa, and one from La Rochelle; one, moreover, was a surgeon who had been a patient for several months. None of them were attacked so slightly as to be cured by repose in bed. The bark of Adansonia was given in a dose of 30 grammes in one litre of water; three such doses were generally sufficient. The taste of this decoction is not at all disagreeable, and its action is not accompanied by any of those inconveniences which are sometimes produced by sulphate of quinine. Adansonia digitata is common in Senegal, where Adanson, who described it, saw it employed for the purposes I have mentioned. Nothing would be easier than to get a new supply of bark; and considering, on the one hand, the high price of Peruvian bark, as well as the expense to which the public are put in the treatment of intermittent fevers, and, on the other hand, the difficulty of obtaining sulphate of quinine, even adulterated, it may perhaps be worth the while of the academy to pay attention to the facts above stated, and to endeavour to obtain a plentiful supply of this bark from abroad. After this communication was read, M. Bussy announced that the Government had already taken up the subject, and that a large quantity of baobab (Adansonia digitata) had been imported for the purpose of being examined in a chemical and therapeutical point of view. M. Bussy also expressed his readiness to place samples of the bark in the hands of such practitioners and chemists as might desire them. *Comptes Rendus.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Watering is an operation which at this season must be performed with increased caution, and the little that is required should be given in the morning, when the ventilation is first increased above the ordinary night quantity. To assist in drying up the damp which is unavoidably engendered both by the watering and the natural circumstances of the season, a moderate fire should be lighted at the same time, except when the sun itself is strong enough for the purpose. The application of artificial heat during the day will render it necessary to open the ventilators wider, to allow free egress for the evaporated moisture. Extremes, however, must, in this, as in every case, be carefully avoided, keeping in mind that the object in using the pipes or flues during the day is merely to free the house and its atmosphere from superfluous moisture, and that the existence of the latter is calculated to be injurious. A very arid atmosphere is not less irreconcileable with the well-being of plants which are in the possession of healthy foliage. It is even more detrimental to them than to the ripe fruit of the Vine. The middle course must be the one pursued, regulating the amount of air and fire-heat, so as to effect the desired purpose by the usual time of reducing the air in the evening, when the heat should be checked by means of dampers in the flues, or stop-cocks in the hot water pipes. After such treatment during the day, the heat enclosed within the house will generally be sufficient during night for greenhouse plants; as they will endure a much lower temperature when comfortably dry, than under different circumstances. Stove plants require much the same treatment at this season, taking care, of course, to proportion the temperature according to their natural requirements. If their wood is properly matured they will stand uninjured in a very low temperature. Ixias, Sparaxis, and other Cape bulbs of that kind, should be repotted and plunged in a cool frame, or they may be planted out in a frame of prepared soil, and their elegant blossoms used for placing in the glasses. In favourable localities it is not necessary to use a frame, as they may be planted in the ground in a nicely prepared border, and left there for several years. It is not by any means a good plan to part these plants too frequently, as they are not very productive of flowers the first year after they have been disturbed. If grown in pots therefore, unless very much crowded, it will be better to be content with carefully removing as much of the soil as can be managed, without disturbing the bulbs, and replacing it by some fresh soil. For the smaller growing kinds, the compost should be light and sandy, containing a considerable admixture of peat; but for Gladioli, and others of similar growth, a soil somewhat richer and stronger is needed. In all the plant-houses let most scrupulous cleanliness and neatness prevail, and spare no pains to give them a gay and cheerful appearance, that the contrast between them and the external desolation, now beginning to reign around, may be more conspicuous. At this season, by good management, plant-houses may be made a luxury indeed, and will afford pleasure to their proprietors.

FORCING DEPARTMENT.

As the length and strength of daylight is now so rapidly diminishing, all the glass sashes of the different structures should be washed; and to render the good effects of this ablution as permanent as possible, the mats, &c., which are all used for covering at night, should be carefully removed to the sheds during the day and kept perfectly clean, or the sashes will soon be as dirty as ever. Pineries.—Montserrat Pines, which are now showing or flowering, will be invaluable in early spring and should be assisted by every available means. A steady bottom and top-heat must be maintained, and the most careful attention paid to watering. Let them have all the light possible, especially while they are in flower, at which time air must be liberally admitted during the day, to dry the atmosphere, and to prevent the monstrous growth of their crowns. Vineries.—In the Vineries containing winter Grapes every exertion must be made to prevent damp. Any faulty places on the roof which admit drip should be repaired, and slopping of water entirely avoided. Where there are beds of tan or leaves for plunging plants in during the summer, it is a good plan to surface the beds with dry sand, to keep down evaporation. Any Grapes which are not yet properly ripened should be kept a little warmer during the day; this will at the same time assist to ripen

the wood. Let all growing laterals be constantly removed, to allow of the freer admission of light; and in cutting the fruit from spurs, prune back at once to the most promising eye near the base. Mushrooms.—Continue to make up successional beds, as the season advances, and spawn and soil the earlier ones, as they are ready. It will be found time and material well bestowed to spawn the beds twice, with an interval of a fortnight between the two spawnings; by this simple means, we ensure a regularity of crop all over the beds, and the supply is more abundant and more permanent. Let the beds be spawned 1 foot asunder, in the first instance, leaving marks where it is inserted; and plant the second lot midway between the first. Keep the floor constantly moist, and the house quite dark. Let the admission of fresh air be from the lower part of the house, through the floor, if possible, and have ventilators so arranged that the evaporation may pass off freely at the top.

FLOWER GARDEN AND SHRUBBERIES.

Little can be done in this department, except in cleaning and removing annuals and half-hardy plants as they cease to be effective; and, as the various masses of these are removed, the beds should be at once filled with their winter and early spring occupants, whether of bulbs or dwarf evergreens. In planting the former no time should be lost; but, if a press of other work renders it necessary to postpone the latter, let the ground be neatly dug over, to give it a clean and fresh appearance for the time being. Attend to the pruning and training of climbers, and the staking and tying of any plants requiring artificial support. Very great exertions should be made at this season to render the neat and orderly keeping of a place conspicuous, that it may in some degree compensate for the gradually fading beauty. As the leaves of some of the trees are now beginning to fall, it becomes every day a more difficult matter to keep the grounds in order, and renders the most industrious perseverance necessary to maintain them in a creditable condition. Let the necessity of intense exertion be forcibly impressed on the mind of every propagator; every day's delay in putting in cuttings, at this season, lessens the short time that they would have for striking root and strengthening themselves before winter. Unless this work is completed a very strong force should be concentrated upon it, as the early summer display for next year depends considerably on the greater part of the half-hardy stock being propagated in the autumn. Attend to those in progress, by judicious watering, shading, and ventilation; remove all decayed leaves, and carefully cut away every attempt at producing flowers. As soon as the cuttings are rooted, let them be gradually but speedily inured to the open air, that they may form sturdy, healthy plants before winter. If frame-work in winter cannot be afforded for the autumn-struck Roses, they should be planted in rich soil, in well sheltered borders, in the reserve garden, that they may have time to establish themselves. The Tea-scented and other tender kinds should occupy a compartment by themselves, where they can be conveniently protected from frost. Brompton, Queen, and late Ten-week Stocks should be transplanted into light soil, in a warm, dry border, where they can be protected by placing a wooden frame over them during winter. Take advantage of favourable weather for gathering seeds; those of biennials and perennials should be cleaned immediately, and sown in the reserve garden. A considerable time, often amounting to an entire season, is saved by sowing many such plants in autumn.

KITCHEN GARDEN.

Do not, because the season is far advanced, allow the destroying of weeds to be neglected, as many of them will yet perfect their seeds, and increase out-door difficulties another year. We have sometimes seen a gardener attend energetically to this during the earlier part of the season, but by suffering the autumn weeds to grow and ripen, he had more than his old work to do again the next year. The earthing up of Celery and Cardoon crops had better not be longer deferred, lest they should be injured by frost; the operation should be performed when the ground is dry, finishing the work at one operation. This plan for the late crops is excellent, as both these vegetables are found to keep a month or two later than plants earthed up early; and the work is done at less expense when done at one operation. Take advantage of wet weather to rub seeds out, rope Onions, and twist haybands for Cardoons; and let the most useful men help forward with the work in the other departments.

HARDY FRUIT GARDEN.

Let the different varieties of Apples and Pears be carefully gathered as they ripen, and labelled. The shelves on which they are laid should be quite clean and dry, and the atmosphere of the fruit room kept perfectly sweet by allowing a free current of air to enter below, and pass through the roof, thereby carrying away with it all the exhalations which, if allowed to stagnate within the room, would materially injure the keeping qualities of the fruit. In storing the fruit let all inferior or damaged ones be carefully picked out, laying them aside for immediate use; if this be not attended to, such fruit will soon begin to decay, and if not immediately detected will be liable to communicate the disease to their neighbours. The fruit room should be cool and dry, and provided with means for preventing excessive changes of temperature; it should be provided with efficient means for excluding frost, either by shutters or curtains to the windows. When its situation happens to be near a plant house, or early forcing house, heated by means of a boiler, a small hot water pipe properly supplied with stop taps may be carried round the room; this would ensure the exclusion of the frost, and in very wet weather would be useful to drive out the damp. Shelves are preferable to drawers for keeping fruit in during winter; as it is more easily examined, and any that is beginning to decay can be removed without injuring that which is still sound. When drawers are used it is scarcely possible to avoid considerable injury to the fruit every time they are moved, as it is inevitably rolled and rubbed about, thus causing it to become spotted and unsightly, and at the same time hastening its decay. If the planting or removing of any fruit trees is contemplated this autumn, preparation should be made for the purpose as early as possible, that the work may be completed immediately after the leaves begin to fall. If this is attended to the trees will feel their way into the new soil this season. If any new trees are wanted from the nurseries, it is advisable to order them immediately, that they may be amongst the earliest selections from the nurserymen's stock.

State of the Weather near London, for the week ending Oct. 3, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 6th, 1834—therm. 79 deg.; and the lowest on the 6th, 1826; 7th, 1844; and 9th, 1829—therm. 29 deg.

Notices to Correspondents.

To our Correspondents.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

Books: *J R Kelly.* There is no good gardeners' dictionary adapted to modern gardeners. Loudon's "Encyclopædia of Gardening" is the nearest approach to such a work. Don's is waste paper. We are not booksellers, and do not give prices, or such information as should be found in advertisements.—*A Sub.* Books with coloured plates cannot be sold at a low price. Sowerby's "English Botany" and Baxter's "Genera of British Flowering Plants" are both cheap works of the kind. They may be had of all booksellers. We never give prices or recommend tradesmen. We cannot answer your inquiry about a successor to "Lady's Botany," because you do not state what your further objects are. The plant often called Tea-tree by cottagers is Lycium barbarum. Kalosanthes coccinea may be had in every nursery, under the old name of Crassula coccinea.—*R T M.* Hooker and Arnott's "British Flora" will perhaps suit your views. But you must be well acquainted with botanical language in order to understand it. The same work will give you information concerning all other wild flowering plants as well as Grasses. If you do not understand the book, then you should study Lindley's "School Botany," and the Glossary of terms in the same author's "Elements of Botany." If you want a work with plates you had better procure Parnell's "British Grasses," in 2 vols. large 8vo.

Bulbs: *Inquirer.* Take up Amaryllis formosissima now, and transfer it to a greenhouse. Let the leaves be allowed gradually to wither; keep the pot dry. In the spring begin to force in March, and in the end of May turn the plants out again. Tigridias must be now taken up, and the roots kept in a dry room, secured from frost, until next May.—*D M.* Plant Hyacinths, Crocuses, Snowdrops, Snow-flakes, Anemones, Squills, Fritillarias, Winter Aconite, and early Tulips; not Ranunculuses.

Country Shows: *J H* says, that at a local show in Scotland, where six herbaceous plants were exhibited, one of them was a Tiger Lily, and he asks if that is right, *i. e.*, are bulbs classed as herbaceous plants? This it rather a difficult question. In common parlance bulbs are distinguished from herbaceous plants; but bulbs certainly are herbaceous plants notwithstanding.

Crocuses: *Stanton.* If you will plant together the *large* yellow, with purple and white vernus of different shades, they will all flower at the same time, without other precaution. There are no colours among Crocuses except yellow, white, and various tints of purple.

Cucumbers: *A Subscriber.* Jabus Maid Cucumber is not grown at the Chiswick Garden, nor do we know anything about it.

Dahlias: *S S.* There is nothing new in the specimen sent. Among Dahlias such occurrences are very common. ‡

Elder Wine: *Pen.* First sort very excellent. Boil 20 gallons of water; when cold add 20 lbs. of Raisins cut or chopped small; let them work together 10 days, stirring them twice each day; strain the liquor through a flannel bag; then add 6 quarts of Elder juice, and a little juice of Sloes; put the whole into a cask, adding 7 lbs of moist sugar, and ¼ oz. of isinglass dissolved in a little of the liquor, with 2 pints of brandy; let it stand three or four months, when it may (if fine) be bottled. Another and inferior sort: To a peck of berries put 3 gallons of water; boil it half an hour, then strain it through a coarse sieve; to every gallon of liquor put 3 lbs. of moist sugar, and the whites of two eggs; then stir all together and boil it again half an hour; skim it well; when almost cold work it with a little yeast; when put into the cask add to it some Cloves and Ginger; also a pound of stoned Raisins to every gallon of wine; let it stand three months; then bottle it.—N.B. The Ginger should be bruised.

Forcing-house: *Agrestis.* You may grow against the wall either a Peach or Apricot or Greengage Plum, provided the Vine-leaves do not overshadow the wall. If your garden will admit of your doing so, you had better take from the open walls each year a tree large enough to cover the space in your house, and put it back again in the succeeding autumn, replacing it by a second tree from your walls.

Fruits: *E B B.* Twelve sorts of Pears for a south aspect wall: Marie Louise, Gansel's Bergamot, Beurré Bosc, Beurré Diel, Winter Nelis, Thompson's, Knight's Monarch, Passe Colmar, Glout Morceau, Old Colmar, Easter Beurré, Beurré Rance. Twelve sorts of Plums for a south aspect: Royale Hâtive, Green-gage, Reine Claude Violette, Washington, Jefferson, Nectarine, Denyer's Victoria, White Magnum Bonum, Blue Perdrigen, Coe's Golden Drop, Coe's Fine Late Red.‖

Fruit-rooms: *An Old Friend.* A fruit-room should be ventilated well, and kept cold, but not lighted, except occasionally. The greater the circulation of air the better. Do not use straw, because it is apt to be mouldy. Dry fern is the best material. Do you really think that any men are so dull as not to understand what is meant by mismanagement?

Fruit Trees: *A Subscriber.* The following are good sorts of Peaches for forcing: Royal George, Grosse Mignonne, Bellegarde. Nectarines for the same purpose: Elruge, Violette Hâtive, and the Stanwick. Peaches for the open wall: Grosse Mignonne, Royal George, Noblesse, Bellegarde, Barrington, Late Admirable. Nectarines: Add the Impératrice to the three above mentioned. The White Marseilles, Pregussata, and Brown Turkey are good for forcing. The small pale green Fig to which you allude is most probably the Nerii. You may grow the Jargonelle, or any early Pear, on a north aspect. ‖

Glass: *J E.* If Hartley's patent rough plate be suitable for the growth of Grapes in houses, it will be suitable for their growth in pits. Where is the difference? ‡

Hyacinths: *Mary Springfield.* You cannot force Hyacinths twice successively. You should plant them in the open borders, in dry well drained places, and they will supply you with a gay decoration of your out-of-doors garden.

Incrusted Boilers: *A B.* The "fur" may be removed by adding sal-ammoniac (or muriate of ammonia) to the water, in the proportion of 1 ounce or so to every 90 gallons of water. "Fur" will however be again deposited unless you use rain-water in future. ‡

Insects: *A B.* Your tree is covered with the mussel scale. If you can wash it and scrub it repeatedly with hot water you may clean it; if you cannot you must endure the evil, for it is incurable. The tree should not have been allowed to get into such a state.—*R A.* The caterpillar is that of the peppered moth, Biston betularius. *W.*—*J C M.* The insect sent with the seed of Wheat is one of the myriapods, a species of Julus, but completely destroyed. It is often, but improperly, mistaken for the wireworm. *W.*—*H R J.* Westwood and Humphreys' "British Butterflies and Moths," three vols. 4to, contains descriptions and figures of all the species, of full size, with the caterpillars. Wood's "Index Entomologicus" contains figures of all the species reduced to the width of about an inch, without caterpillars; and the Lepidopterous volumes of Stephens' "Illustrations" contain descriptions of all the species, with a few figures. All are easily obtainable. *W.*

Landscape Gardening: *A Rector.* If you will favour us with your address we will write to you privately. Your letter is sent to Mr. Kidd.

Mildew: *Wix.* Surely you do not imagine that we approve of every notion which may enter our correspondents' heads. When opinions are entertained by one man of average intelligence, it is probable that the same opinions, however childish or absurd, will be held by others; and the easiest way to expose them is to publish them. We cannot personally deal with every folly, or vulgar error; for we do not derive our origin from Briareus, but you must own that we grapple with a reasonable number. Your letter next week.

Names of Fruits: *Inquirer.* Your Grape, said to be from the Crimea, is not like any known variety of the Vitis vinifera. It has a small oval black berry, with a shiny pulp, very bad, detestable, like some of the American Fox Grapes ‖—*J S.* The Summer Franc-Réal.‖—*J K, Bath.* 1, Beurré Rance; 3, Duchesse d'Angoulême; 6, Passe Colmar; 53, Ne plus Meuris; 19, Pond's Seedling Plum. Your seedling Peach is a clingstone, and none of that description is reckoned first-rate in this climate.‖—*A Constant Subscriber, Hythe.* The Golden Noble Apple.‖—*Thomas Gee.* Violette Hâtive Nectarine.‖—*M B.* The long-shaped dark-coloured Pear is the Bishop's Thumb; the other, bruised, is perhaps the Orange Bergamot.‖

Names of Plants: *Diss.* We are unacquainted with the material called "Alva marina" (prepared seaweed), sold at the bedding warehouses for stuffing mattrasses.—*Ravenswood.* 1, Lastrea spinulosa? 2, L. recurva? It is impossible to decide with certainty from such specimens as these; they are young plants of large growing species; in a few years the same plants, if placed under favourable circumstances, will probably develope fronds 2 feet or more in length. *S.*—*Erzeroum.* 222, Symphytum near caucasicum; 405, Echium vulgare; 47, Nonnea pulla, a bad specimen. Borage-worts should have their ripe fruits attached. 131, Onosma microspermum; 278, Onosma?—*G L.* Epidendrum gladiatum, and Galeandra Baueri.—*Anna Harrison.* The white state of Cyclamen hederæfolium.—*Vectis.* Certainly it is Alyssum maritimum.—*Ordovix.* Cuscuta Trifolii.—*W D.* Godetia purpurea.—*J R M.* Your plant is not in a state for determination. Send it again hereafter with ripe fruit as well as flowers, and some account of its history. You had better send your thermometer to a philosophical instrument maker.—*W D F.* Plants can rarely be named from an inspection of a single leaf. Yours is probably a New Holland Acacia, near A. lophantha. We venture to doubt its South American origin.—*D C L.* A specimen and clever sketch of — common Hemp, Cannabis sativa.—*Ravenswood.* It is Celsia Arcturus, which will not bear frost. You will never manage a greenhouse by books alone. A good help is Mackintosh's "Greenhouse, Hothouse, and Stove."—*E N R.* The Convolvulus is our common Bindweed, Calystegia sepium; Digitalis ferruginea, Helenium autumnale.

Potatoes: *D.* If you will consult our volumes for 1845, 1846, and 1847, you will find that autumn planting is attended with the greatest success. We believe it to be by far the best plan if land is ready, and if Mr. Grey of Dilston's method is observed.

Rabbits: We should be greatly obliged to any correspondent who will inform *An Old Friend of this Paper* as to the best means of catching rabbits or preventing their incursions—he would prefer catching them. His steel traps do not always hold them. Is there any book on the subject?

River Water: *X Y Z.* We presume that you can take what water you require, so that you do not injure others. But you should consult your solicitor.

Vine Leaves: *Belper.* We are unable to ascertain what ails the leaves. The appearance is very much that of leaves acted on by the fumes of sulphur, or sulphurous acid. We doubt whether they are *diseased* in the proper sense of the word.

SEEDLING FLOWERS.

Antirrhinums: *M H.* A very large-flowered robust variety, suitable for borders.*

Calceolarias: *M H.* Both good flowers, and worth cultivating; but of the two we like 16 best.*

Dahlias: *Z.* Your seedling is large, well up in the centre, and of good outline; but it is somewhat "ribby." The blush flower is well formed, very deep, and has a compact centre; when shaded it will pass for a white. Apparently two good flowers; but of their constancy of course we can form no opinion.*—*T R P.* So much bruised and spoiled by travelling that no opinion of their merits could be formed.*

Fuchsias: *W D.* Worthless as a show flower.*

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Clover Manure, per ton	...£11 0 0
Turnip Manure, do.	... 7 0 0
Superphosphate of Lime	... 7 0 0
Sulphuric Acid and Coprolites ...	... 5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

GUANO AND OTHER MANURES FOR WHEAT SOWING.—On Sale, Guano (finest Peruvian), Superphosphate of Lime, made from Bone, Bone-dust and half-inch, Dried and Prepared Night-soil, Urate, Gypsum, &c. Also Foreign and English Linseed Cake of the best quality.—Apply to MABE FOTHERGILL, 204 A, Upper Thames-street, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

LAND DRAINING AND IMPROVEMENT COMPANY, 30, Parliament-street, London; and Bedford Circus, Exeter.

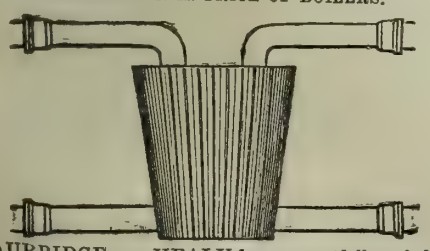
This Company having been in active operation for several years, is ready to undertake Works under the Government Loan, or by fixed or annual charges under its Act of Parliament.

Further particulars and references may be obtained at the offices. THOMAS MAY, Secretary.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.



STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

REDUCTION IN PRICE OF BOILERS.

BURBIDGE AND HEALY beg respectfully to inform their Friends, in consequence of the present reduced price of iron, they are enabled to make a considerable reduction in the price of their Boilers. The price will be, now:

10 in. will warm	50 ft. 4 in. pipe	... £1 15	0
12 in. do.	75 ft. 4 in. do.	... 2 5	0
14 in. do.	100 ft. 4 in. do.	... 2 15	0
16 in. do.	150 ft. 4 in. do.	... 3 10	0
18 in. do.	250 ft. 4 in. do.	... 4 10	0
21 in. do.	350 ft. 4 in. do.	... 5 10	0
24 in. do.	450 ft. 4 in. do.	... 7 0	0
NEW PATTERN BOILERS.			
25 in. will warm	600 ft. 4 in. pipe	... 11 10	0
30 in. do.	800 ft. 4 in. do.	... 15 15	0
36 in. do.	1500 ft. 4 in. do.	... 25 0	0

All Boilers with double arms, up to 18 in., 5*s.* extra; to 24 in., 10*s.* extra; all above the same price.

130, Fleet-street, London, Oct. 5.

IMPORTANT NOTICE — EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

DR. S. NEWINGTON'S AGRICULTURAL INVENTIONS.—An Illustrated Catalogue, together with a Lecture on the Seeding of Grain, and the after cultivation of the crops, sent gratis, on application to Messrs. DUFAUR and Co., 21, Red-lion-square, London.

TO CLERGYMEN.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

It being intended, after Christmas, 1850, to establish a School for boys under 17 years of age as In-students at this College, a PRINCIPAL is wanted to superintend the Institution. He must be a Clergyman, and competent both for the teaching and management of youth. Salary 300*l.* a year, with a fee of 2*l.* per head for every pupil in the school. Out-students above that age will continue to be received as usual.

By order of the Council, PHILIP BOWES, Secretary.
London Office, 26, King William-street, West Strand.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

WANTED, an intelligent PRACTICAL FARMER, thoroughly competent to undertake the Management of the Farm attached to the College. He will be expected to cultivate the farm on the most improved system consistent with economical principles.

By order of the Council, PHILIP BOWES, Secretary.
London Office, 26, King William-street, West Strand.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 5, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Oct. 10—Agricultural Imp. Society of Ireland.
THURSDAY, — 17—Agricultural Imp. Society of Ireland.

THE best plan for applying the LIQUID MANURE OF THE FARM to the soil has long been an interesting subject to farmers. Attend as many public or private meetings as we may, we find this among the most prominent topics of discussion. Englishmen, Irishmen, and Scotchmen, are agreed upon the propriety of abusing each other roughly for the waste of liquid manure upon their respective farms. Indeed, the theme has become of such a common-place character that every amateur, on making his *debut*, is sure to cuckoo it with an air of importance, as if, at the first yoking of his harrow, he had brought to the surface an immortal discovery.

Practical men, on the other hand, who are probably as guilty of theorising, in their own way, as their more gifted companions, have, in self-defence, been all along complaining that philosophers have not yet propounded a theory capable of being reduced to practice, by which they might be enabled successfully to apply the liquid which flows from their dunghills. "Liquid manure tanks," pumps, carts, and expensive apparatus, have been set actively in operation in every province of the kingdom, but without being able to establish anything in the shape of general practice. Results exhibited have not furnished sufficient evidence of success to induce general imitation, and in some cases the whole has turned out a fruitless expenditure. We have seen Grass lands watered over and over again, winter season after winter season, and no beneficial results produced. And why? simply because the soil was saturated to overflowing with water previous to the application. The liquid manure-tank never overflows until the pores of the earth are first full and the rain which has fallen is flowing upon the surface. Great things are invariably talked of prior to the commencement of such experiments, and the attention of practical men duly invited to witness results, but under such circumstances need we wonder at disappointment? Seeing is believing with practical men, and one failure of this kind is sufficient to counter-balance a thousand arguments to the contrary.

The successful and oft-quoted example of Chinese practice is not sufficient to convince. "Far-fetched fowls," it is said, "have fair feathers:" but the climate and agriculture of the celestial empire are very different from those of Britain. Were English farmers a race of market gardeners or peasant proprietors they might, perhaps, notwithstanding this, imitate those of China, but in our present position the pattern requires more hands than we have at our command. And, in practice, to propose a scheme which requires more hands at one season of the year than can be employed at another, is just to propose what is tantamount to an impracticability. It is just to propose an Irishman's life to an Englishman—half his time in the poor-house, and the other half in the field. And we much confess that in our present position, until spade husbandry is adopted, with all its detailed superintendence of the land, we are not sanguine of that system of direct liquid manuring being carried out by farmers generally. Individual experiments may be successfully made, but these, however valuable in themselves, go for little as affecting general practice, and until the public mind has, by steam ploughs and steam labour, taken one-half of the farm work out of the hands of our labourers, we shall not have the means at command to overtake these and other details of the farm as they deserve.

Why the application of liquids, as manure to the soil, is attended with more expense and difficulty, has already partly been accounted for. Over the greater part of Britain, in the first place, they can only be successfully applied at seasons of the year when the labour market is empty, or when labourers are otherwise employed. In the second place they must be carefully applied, or the leaves of plants may suffer; and thirdly, prepared liquids generally require to be diluted, which adds considerably to the expense of transport.

Another scheme has been proposed by Mr. JASPER W. ROGERS, of Dublin, which has many things to recommend it. "It has," says Mr. ROGERS, "been my good fortune to discover that peat charcoal, specially prepared for the purpose, possesses the power of absorbing and retaining all those most valuable products," meaning "the ammoniacal and other volatile gases" previously referred to. "It is perhaps the greatest absorbent known. It will take up and retain many times its own bulk of those gases. Hence its inestimable capability for effecting the deodorisation of all sorts of manure, retaining all the virtues of the liquid matter, as well as its volatile products." Mr. ROGERS proposes to filter through finely powdered peat charcoal, placed in tanks prepared for the purpose, the urine of the stable, cow hovels, and liquid which flows from the dunghill. In this operation the charcoal retains all the elements of the food of plants contained in the urine, and allows nothing to pass through it but pure water.

The published experiments on peat charcoal as a manure, encouraging though they are, have been chiefly confined to its mixture with night-soil, and not to the liquid manure of the farm. Experiments are still wanting to test its efficacy when mixed with the dung of cattle in the various climates of the different provinces of the United Kingdom. Experiments in the moist climate of Ireland afford no satisfactory evidence of what may be expected in the dryer districts of the south and east of England. We would, therefore, suggest to those who have the opportunity the propriety of performing experiments in different parts of the country in order to test the merits of peat charcoal as a manure, both in a mixed and unmixed state, with the dung of horses, oxen, sheep, and swine. A very little addition to the quantity of agricultural produce, which means such as this might produce, sometimes compensates for a considerable defalcation in its price.

These experiments might be variously conducted, both as to the manure itself and the mode of manufacturing it, on the one hand, and its application to the different crops, on the other:—For instance,

1. Parties who already have urine tanks—general receptacles of all sorts, have only to take a few old bags, such as guano-bags, Potato-baskets, &c.—fill these with peat charcoal, and then lower them into the tank for a short time. The charcoal will soon absorb the maximum quantity of all the enriching elements of the liquid which it is capable of doing, and become a very valuable compound. The bags may be emptied and refilled until a sufficient quantity is obtained. The whole could then be mixed together and applied to different crops in different manners, as the party had a mind, on alternate ridges, with pure charcoal, farm-yard manure, &c.

2. A similar, but more extensive series of experiments could be made by using a temporary hole or cesspool adjoining the stable, cow-hovels, &c., or even in the interior of them, with or without bags. A small hole, sufficient to hold one guano-bag, would soon yield a quantity sufficient for any number of experiments. Different mixtures, with the charcoal, could thus be obtained, and a variety of applications made on the different crops.

3. The whole of the urine, as it passes from cattle, might be profitably mixed with the charcoal; but the liquid which flows from the dunghill invariably contains an excess of water. The charcoal in this case could be placed in the bottom of a tank-hole, old barrel or trough sunk in the soil, &c., with a drain leading to it, so as to remove this excess of water. The liquid from the dunghill would then flow in upon the top of the charcoal, and, in being filtered through it for the drain, would leave all its enriching elements, or the greater portion of them, in a mixed state. The insoluble portion of them would, no doubt, remain upon the top of the charcoal, but could be mixed as it was removed from the tank.

4. The moment droppings fall from cattle in the stall, their more volatile and valuable elements are disengaged, and hence lost. No scientific demonstration is here wanted in order to prove the accuracy of this deduction. The smell which arises from them settles the question in the most satisfactory manner, and the loss sustained is far from being an unimportant one to the farmer. Peat-charcoal may be more profitably used by applying it so as to absorb all the liquid and juices of the droppings the moment they fall, than afterwards, as in the previous examples. For this purpose the pavement behind the cattle and under their beds or litter may be strewed with finely powdered charcoal. During summer, when horses and cows are stall-fed upon Tares, Clover, &c., a very large quantity of ammoniacal and other valuable gases would be obtained which are now generally dissipated in the atmosphere, and hence not only lost, but injurious to the health of animals inhaling them.

Again, the bottoms of sheep pens, and even stalls of oxen, are now being constructed of boards or wooden bars or gratings, so as to allow the droppings to pass through. Where this is the practice, a small quantity of charcoal strewed daily on the bottom of the pen, would be attended with favourable results. Also where cattle are fed in loose boxes, a small quantity strewed over the top of the litter daily, would be found equally advantageous.

Reports of experiments could be forwarded to the different agricultural periodicals, so as to ascertain general results from the different provinces, and if these went to show that the conversion of the liquid manure of the farm into solid manure through the instrumentality of *peat-charcoal* is the best practice, then the long puzzling question we noticed at the outset of the remarks is at last solved. *B.*

A few weeks ago, a gentleman who had previously been engaged in mercantile affairs, called upon a friend of ours, a farmer, stating that he was leaving England in a fortnight, as an emigrant, and requesting instruction in farming operations. We had previously heard of "writing" being taught in six lessons, but we certainly before never met with one who expected to obtain a competent idea of the varying operations of a farm in 12 days. Our readers will undoubtedly be amused at the almost contemptuous opinion this gentleman must have had of practical farming. Some such idea will assuredly pass through the mind of most of our readers: and yet is not the contempt with which farmers view the application of scientific investigation to agriculture, an exact counterpart of this gentleman's folly? or are they not still worse than he, inasmuch as they will not bestow even a fortnight's attention to the subject, while they ridicule those who do so?

We really would urge upon our agricultural friends to take the advantage of some of the cheap railway trips, to visit any of the seats of our manufacturing industry, and let them there examine for themselves the results of the application, not merely of mechanical, but also of chemical science. Let them also particularly observe that many of the most important of these results have come in their present practical shape direct from the laboratory of the chemist. No course of lectures, no amount of reasoning or arguing on our part, could be so effectual in removing the absurd prejudice farmers feel against that on which our manufacturers set so much value, namely, the application of science to their business.

It will be answered that growing a crop of corn is a widely different operation from the preparation of soda or any other chemical manufacture. We reply, it only differs in being more difficult and complicated. The variation of the seasons, frost or snow, rain or drought, all seriously enter into the list of the farmer's difficulties, and not at all into the manufacture of soda. We admit the force of this objection; but is the greater difficulty an excuse for the farmer despising the assistance of that knowledge which has been so useful to the manufacturer. Because a certain part of the growth of his crops is beyond his control, is the farmer to neglect the study of that which is directly under his management? But is there no point of resemblance between the soda manufacturer and the farmer? We think there is. The manufacturer mixes together, in certain proportions, coal, sulphate of soda, and chalk. Now, if these substances were merely mixed together very carefully, and left for some time, a slight chemical change would take place, and a small quantity of carbonate of soda would be the result. Such a plan of procedure would however be too slow and too imperfect for the manufacturer; so, in order to expedite the process, heat, in a properly prepared furnace, is applied, and the utmost quantity of soda the mixture is capable of yielding is at once obtained. In like manner the farmer knows that if Wheat, for instance, be sown on an impoverished soil, he will get a crop, but like the result of the simple mixture of the ingredients for preparing soda, much too small to be remunerative. In this dilemma the farmer adds to the soil a certain quantity of manure, and he finds that his crop of Wheat is in direct proportion to the quantity of manure applied, and to the state of preparation of the soil and of the manure. He finds that there is a difference of his crops (independent of the seasons) in proportion to the labour bestowed on the soil, and the care given to his manure heap, exactly as the manufacturer of soda finds his results depend upon the careful preparation of the necessary mixture, and the skill with which the after part of the process is conducted. Both are equally a chemical process, and there was a time when the manufacture of soda was as great a mystery as the growth of the Wheat crop; but no sooner is the former thoroughly understood than improvements immediately follow. In like manner—to pursue the very simple case we have taken—is the farmer sure that the manure he applies to his Wheat crop is the best possible for that purpose? Is it, as usually applied, in the best possible condition for the desired end? Or rather, in nine cases out of ten, does he know anything at all about the matter? Hugging their own ignorance, and shutting their eyes to the benefits derived by the manufacturer, do not many farmers evince no wish to procure for themselves, or to secure for their children, any education better than the village schoolmaster can communicate? We venture to predict that the end of the 19th century will scarcely, in this respect, be proud of the middle.

We have been induced to make these remarks from observing the meagre support given the Cirencester College by the body of men it was able to benefit.

ABSORPTION OF MANURE BY EARTHS AND LOAMY SOILS.

This subject has excited a very lively interest of late, and particularly since the appearance of Professor Way's Essay in the last Journal of the Royal Agricultural Society. Experiments in various branches of culture had long since unerringly pointed to the great fact that manures, particularly the ammoniacal and fetid ingredients of liquid manure, are absorbed and held fast by all soils fitted to the cultivation of grain crops, and of the best garden vegetables. Such experiments, having been undertaken for some definite object, did not at the time lead to any conclusions bearing upon the question of absorption, which now occupies general attention, and has been solved in a manner so entirely conclusive. Some of the experiments alluded to now may recur to the recollection of many persons who have been in the habit of applying manure-water of various kinds to potted plants, and to such, the following statement of simple, but unerring, facts, may afford some gratification, and also conduce to the further extension of experimental science.

A liquid manure was prepared by steeping four heaped garden-trowels (call the bulk half a gallon) of horse-droppings, that were collected in a heap about Midsummer, in twice the volume of hot rain-water for 20 hours, to which was added about a quarter of an ounce of strong liquid ammonia; and the mass was repeatedly stirred. The ammonia was intended to extract more of the humic matter, which, by the progress of decay (*eremacausis* of Liebig), had formed in the droppings. In the meanwhile, a glass cylindrical vessel, 8 inches long, 4 wide, open at both ends, but at one terminating in a contracted orifice, was prepared by tying over that neck a piece of strong linen, to act as a drainer. This glass was nearly filled with light garden earth, rather loamy, but comprising so little chalk as to show merely the slightest frothy beading on applying strong muriatic acid. The earth was screened, but neither finely sifted nor powdered, and just so moist as to permit the free and gradual circulation of fluid throughout every particle of it. When so filled and patted by the hands as to make the soil lie evenly in every part of it, the glass was placed, small end downwards, in a position to permit all the drainage filtrate to be caught in a clean glazed pan. The manure-water was then drained from the mass and left to deposit its feculence till a clean, though not bright liquid remained. This fluid was tested for ammonia by immersing in it a bit of quicklime, which liberated so much of that gas as to produce a sensible hazy cloud of vaporous muriate of ammonia on presenting the stopper of a muriatic acid bottle to it. It was then tested for sulphuric acid by several barytic solutions with scarcely any result; for lime or its salts, by oxalate of ammonia, equally without visible results; but not so for muriatic acid, for nitrate of silver caused a curdy deposit of the muriate. The "questions" so answered furnished the basis for comparative final results. Over the surface of the mould in the cylindrical glass were poured two-ounce measured portions of the liquid manure, watching and waiting for the progress downward and through the soil between each addition. By the time that from 8 to 10 fluid ounces had penetrated, drops of liquid began to pass through the linen, and before the 12th ounce had entirely sunk down, three fluid ounces of filtrate were in the receiver. Here it should be noted that the soil was fully saturated by the time that 10 ounces had been used, because the fluid which passed subsequent to the addition of the last two-ounce portion began to assume a faint brown tinge; whereas the first portions were quite pale, almost as much so as rain-water.

The reader will do well so to try every kind of manure-water—that which runs from farm-yard mixens, and all others that are prepared artificially, even including solutions of guano, and he will rarely fail (if the soil be appropriate—sand and heath-mould are not so) to obtain proof that colour and odour are effectually destroyed, and thus a first and convincing evidence of the attractive energy of soils will be obtained.

The next series of experiments upon the filtrate comprised a repetition of the testings mentioned above. First, a lump of lime was immersed, and, in accordance with the results obtained by Mr. Way, the ammonia was absent—the mould had held it fast. Again, with a similar accordance, the test by oxalate of ammonia gave proof demonstrative that lime in abundance had been carried down in a state of chemical union with two acids at the least; for nitrate of silver threw down much chloride of silver, showing the predominance of muriatic (hydrochloric) acid; and three barytic tests (the simple solution, the acetate, and the nitrate), all and severally produced a cloudiness of the sulphate.

Now whence could these salts of lime have been derived, and by what agency? The question is equally important and deep, as is another to which it gives rise, namely—What will be the ultimate bearing of such results upon the theory and processes of thorough land draining, since it should appear that the clear water which passes is, in point of fact, reduced to the condition of hard water, which in itself is inimical to vegetation. *J. T.*

THE RESULTS OF MACHINERY.

A Village Lecture.

(*Concluded from p.* 618.)

Now let us inquire into the question of profitable and unprofitable labour. You all know what is meant by capital. Your capital is muscular; mine is pecuniary and mental. The aim of each is to use this capital profitably. You employ your muscles profitably when you earn a fair weekly wage. I employ my money profitably when I increase it. You would consider yourselves ill paid to earn less per week than bread and meat cost you. I should think my capital badly laid out except I realised some per centage upon it. What would you think if I came home one day from market with a number of strong hampers, furnished with straps to be slung across the shoulders, and told you that henceforth I should disuse the carts and employ a great many men to carry manure down to the field instead of having it carted thither? "Well," you would say, "I never heard anything to come up to this. Here's our master going to work us like beasts. I wonder what he conceits to sell his corn for? To be sure some people have queer notions; but, for my part, I'd rather try to win than to lose." Well, the cost of producing my Wheat and other grain would of course far exceed the market value of it, if I was the only farmer who pursued the plan, and then I should lose each year a part of my capital; but supposing all farmers followed my example, there would be but little grain wanted; because scarcely any one could afford to buy it, and the land, consequently, would be left to nourish weeds. This system, therefore, being unprofitable, would fail.

Suppose that one of you dwelt on the top of a hill, and could only procure water by fetching it from a pond at the bottom. If you had a boy that task would fall upon him, and instead of taking him to work you would leave him at home. You would be not a little pleased, on coming home one evening, to hear your wife say, "Oh, John! I've got such good news; you can't guess it, but our landlord has been here, and a right good gentleman he is. I told him how it took one person's time to fetch the water, and he said that he would be at the expense of sinking a well, and building a pump for our row. The boy can go with you now, and then his wages will pay both rent and shoe bill."

I do not expect that you would grow Potatoes in your gardens if you could purchase them for less money than they would cost you in labour, manure, and seed. "No," you would say, "it is unprofitable labour, and I will try and turn my land to better account. And if you could buy all vegetables and grain, and all that you could depend upon your garden to produce, more cheaply than you could produce them, I am not wrong in saying that you would allow your gardens to go out of cultivation. In a word they would not pay.

You think much of your gleaning here, but in America the fields are never gleaned. The wives and children of the labourers can turn their time to better purpose.

Years gone by your wives used to knit stockings; but now that they are to be bought for less than the materials previously cost, no one thinks of making them, and the knitting needle has been broken up for bradawls. The spinning-wheel is for the same reason no longer heard, and the pillow and bobbins of the lace-maker are rarely seen at our cottage doors now. The machinery used in the manufacture of these articles was so inefficient, and the time expended so great, therefore, that none but the rich could afford to give the high prices that the maker was obliged to put upon them in order to pay himself: consequently, the demand for stockings and lace, &c., was small. Any means that will lessen the cost of production, either of food or clothing, &c., must have the effect of increasing the demand for them. To satisfy this demand, an increase of capital is necessary; and this capital sets to work a greater number of

men. Now by machinery the cost of production is lessened. Let us take a case. In some cities of Spain, at certain periods of the year, water is as dear as wine; this is owing to the want of a little simple machinery common with us. Thousands of men are engaged as water-carriers. These men will not work except they are paid, so the high price of water renders it an article of luxury even to the rich, and the poor are fain to do without it. Suppose that each city employed 600 water-bearers, paying each 10s.,—300*l.* alone per week, laid out in what we may call the production of water. A simple contrivance is introduced by which the city is supplied with water for 50*l.* per week. The people or corporation of that city will find itself 250*l.* in pocket, and the 600 water-carriers will be dismissed. The city authorities call a meeting. The chairman rises and says:—"Gentlemen, by the late economical arrangement in our water-works, the city is supplied with water at less cost than formerly, and I find that we are the gainers of 250*l.* per week. It is for you to say to what purpose this money shall be placed." One member says, our roads want paving; another, the old harbour must be repaired; a third rises to propose the construction of a new one, and the laying out of public walks; while a fourth reminds the members that one or two monuments are to be erected. The chairman then sums up the proposals, and says, "Well, gentlemen, there are plenty of idle men about; let us set them to work before they get into mischief, and into prison, where they will be a burden to us." A portion of the men are employed by the 50*l.* per week, to keep the water-works in order; the remainder are forthwith set to work by the 250*l.*, and the city is greatly improved.

I get my Wheat threshed for a less sum by machinery than I can by hand, and the money saved in this way goes to give employment to a greater number of people in various directions about the land. If you combine to destroy all the machines upon my farm that economise human labour and lessen the cost of food, you benefit neither yourselves nor me. You will oblige me to employ fewer hands, and to do a much less amount of work; I must either drop all my improvements and do just what is necessary, or give up a part of my land. The consequence will be that food will be raised in price to you, together with all those necessaries and conveniences of life that do not employ your labour, so that all classes would fare the worse for the destruction of machinery.

After what has been said, it is almost needless to ask if it is not always your aim to expend as little labour at home as possible. You would not work at home upon anything that could be done as well by your lads, and you would be dissatisfied to leave two lads at home to accomplish what could be done by one alone; and, if the work which engaged your one boy could be done by some contrivance without him, you would consider yourself very happy. It is therefore your object to set fast as little capital (which is labour) at home as possible, to invest the greater quantity in a better concern. The less labour spent at home the greater will be the amount of weekly wages. If you receive more than can, with good management, be spent on the necessaries of life, you have the more with which to purchase its comforts. You build a sty, buy a pig, hire a rood or an acre of land, and by these means gradually rise beyond all fear of the workhouse.

Collectively, we endeavour to follow as near as possible the example of the individual. As a nation, we are anxious to economise the labour requisite to make provision for our own necessities, and to gratify our own tastes and pleasures, in order that we may have the greater amount of labour to expend in the service of other nations, for which we receive adequate remuneration. If we consume all that we produce, it is clear that there will remain nothing to sell, and we shall be in the condition of that labourer whose weekly wages only cover his weekly expenditure. The more goods we have every year over and above our consumption, of course the richer we shall be. Our aim therefore should be to increase the amount of food and clothing, &c., without multiplying the consumers of either. Could we but find labourers who were never hungry, thirsty, nor cold, our purpose would be accomplished. And so it is, for what are steam engines and power looms, &c., but silent labourers that require neither food nor clothing. Their cost, in the first instance, is great, but is not equal to the value of goods that must have been consumed by the men they represent. By animals we increase our force without materially increasing our consumption, for their food is less expensive than that consumed by the men they displace; and then as to clothing, God has made them independent of us.

A few facts, taken from a calculation authorised by Parliament some years ago, will show you that by the destruction of machinery and the disuse of animals, we should not only put it out of our power to furnish the necessaries and luxuries of life to the people less advanced than ourselves, as we now do, but that we should be unable to satisfy our own wants. There are 30,897,000 acres of land in England and Scotland. To work this land there are only 2,132,440 effective men; they would not be nearly sufficient. The agriculturists of these countries have discovered however the means of creating a force 12 times the amount of the human force by the use they make of domestic animals. The tabular view stands thus—

	Effective Working Men.
Human race, 5,000,000, equal to	2,132,446
Horses of full growth, 1,250,000, equal to ...	8,750,000
Oxen, &c., 5,500,000, equal to	13,750,000
Total,	24,632,446

The human force engaged in the manufactures and commerce of Great Britain is equal to 4,264,893 effective men. This is raised by the addition of animal power to 7,275,497; by the force supplied by wind and water to 21,115,497; and yet further by steam engines to a force equal to 27,115,497 effective men. You will see from the table behind me at what the various powers are estimated.

	Effective Men.
Animate force, equal to	7,275,497
Mills and Hydraulic Engine, ...	1,200,000
Windmills	240,000
Wind and Navigation	12,000,000
Steam Engine	6,400,000
	27,115,427

Supposing that the 4,264,893 labourers were released from the towns, &c., to join the agriculturists, who, without their animals, &c., would be but 2,132,446 men, there would be only a force of 6,397,339 men, which, in comparison with the force equal as we have seen, to 24,632,446 working men would be only as one to four.

We had increased our power therefore at this time, by the employment of animate and inanimate force, from 6,000,000 to 51,000,000 of effective men. But no good would result to us if such a human force should take the place of those machines and animals that now represent it. There would then be some reason in the cry "England is over-populated; there is not bread for the people." You will see however clearly enough how we are benefited by an increased power without an increased consumption, and I need say no more on the point.

And now let us gather a few facts by which we may know how we have been benefited as a nation by machinery. The woollen trade during the early centuries of our history was the great staple of this country. Inferior in skill to the French and the Germans, we sold our wool, &c., at a low price in its raw state to these people, who manufactured it in their own lands, thereby employing their own people, and then returned with it to our market, where it commanded a high price. Thus originated the proverb, "The stranger buys of the Englishman the skin of the fox for a groat and sells him the tail for a shilling." By procuring foreign workmen to teach us their craft, we kept and manufactured the wool, and thus transferred the "stranger's" profits to our own pockets. This was done by the use of foreign machinery. You will smile when I tell you that we have played the same trick with the people of India, and China, and Persia, and Egypt, who produce cotton and silk, &c., and being unable to do anything with it themselves, they sell it to us. We bring it to England, and employ a great number of people to manufacture it into all manner of wearing apparel and useful fabric, and then ship it to those countries and to others, making the purchasers pay us handsomely for all our trouble. By reason of the long passage from India to England the raw material was at first very dear; but the discovery of the passage round the Cape of Good Hope rendered the distance less and the material cheaper. This took place in the 17th century. There were then only the old hand-loom weaving machines and the spinning-wheels going, so that the cost of production or manufacture rendered the price of cotton goods very great, and their sale limited. In 1760 there were 50,000 spindles at work in Lancashire alone. But the spindles could not keep time with the weavers. Some quick method was required to supply the weft. The demand was no sooner made known than forth from the recesses of invention came the very apparatus. I shall not explain it now. A Mr. Lawrence Earnshaw is reported to have invented a machine to spin and reel cotton at one operation, which he destroyed, fearing that it would throw a great many poor out of employ. The reverse of this was proved subsequently by Richard Arkwright, a barber. He invented, in 1769, the apparatus to which I refer, "and by so doing gave bread to two millions of people, instead of 50,000; and assisted by subsequent invention, enormously raised the importation of cotton wool from India; set in motion 6,000,000 spindles instead of 50,000; and increased the annual produce of the manufacture from 200,000*l.* to 36,000,000*l.*" One portion in three of this cotton is used by ourselves.

Two centuries ago not one person in a thousand wore stockings. One century ago not one person in five hundred could bless himself with a pair. Now, not one person in a thousand complains of cold feet from the want of them. The stocking frame makers looked upon the advent of a new machine doing their work with terror; but without reason, for there was more employment for them when every body began to wear stockings. In Nottingham and Derby there are thousands and tens of thousands of persons engaged in this manufacture instead of a few hundreds. Just the same with the lace making. "Two hundred years ago a lady of rank only exhibited her lace when she displayed her diamonds." Now that lace is so exceedingly cheap every body wears it. The manufacture of lace has become, therefore, most extensive instead of very limited, and is the means of employing many people with a machine where it employed a very few without one. The woollen manufacture in like manner has increased surprisingly. In Britain there are 1738 mills, worked by 86,411 persons, realising an annual value of 25,000,000*l.*

In the linen manufacture there are 393 mills and 43,000 people employed within them; its annual value does not exceed 10,000,000*l.* The annual value of silk manufacture is 10,000,000*l.*; there are 150 silk mills, which give employment to 35,000 hands. The hardware manufacture is very extensive, employing 300,000 hands; its annual value is 18,000,000*l.* Then there is the commerce of Britain, to which all this manufacturing gives a mighty stimulus, for we export by far the greater part of our manufactured goods, bringing back money or raw material, or other articles, in exchange. You cannot longer entertain a doubt that the manufacture of cotton, of wool, of silk, of iron, and of a thousand articles that I have not mentioned, by machinery, has produced one of the great results for which machinery is be desired, namely, cheapness of production. And the advantages thus obtained will, you may depend upon it, be equally certain of attainment, when applied in the case of agricultural machinery, from the cheaper and more abundant produce of the land. *F. R. S.*

PHILOSOPHY OF THE DUNGHILL.—No. I.

Farm-yard manure is the produce of roots, straw, corn, Beans, Linseed, oil-cake, &c., consumed by working cattle and fattening stock, having a sufficient quantity of litter. This manure supplies all the materials necessary for the growth of our crops, and it contains all the elements which they require for their perfect development, such as carbon, hydrogen, oxygen, azote, phosphates, chlorides, &c.

The Production of Manure.—The constant attention to its accumulation and its preservation, the preparation and the proper application of it, require constant and unremitting attention every day of the year. The value of manure varies greatly with the kind of food which the animals consume. Beasts, consuming fattening food, such as cake, Linseed, and corn, produce manure more than double the value of that which is made by store stock and young beasts consuming the food generally given to store animals, such as straw or bad hay, with a small quantity of roots, which they sometimes recive in addition. Both the quantity and quality of manure must be attended to; the richer part of it—the urine and that made by the fattening stock have our utmost attention, that none of it go to waste; it must be husbanded and stored up for use, and this can easily be done by such an arrangement as will make an intimate mixture of the excrements of the fattening stock with the breeding and store stock. The best mode of feeding either fattening or store stock is in boxes, and this is the only mode by which the excrements of all animals can be readily mixed; by this system the most valuable part of the exerements, the urine, is all retained. Dry straw should be given to litter the stock sufficient to absorb the liquid manure; this is the best and most important part of our manure manufactory. The urine of our cattle is generally double the weight of the dung, so Dr. Thompson says—dung 9 lbs., urine 20 lbs.; besides urine contains a greater relative proportion of richer material than dung. It must also be borne in mind that fresh dung does not contain the same quantity of ammonia as it contains when it is in a certain stage of fermentation. "The urine of a sow when fresh contains only 1 per cent. of ammonia, while it contains nearly 3 per cent. when it is fermented" (Sprengel); and when it was mixed with its own weight of water before it was fermented it contained more than 8 per cent. of ammonia.

The substances which form the mass of the manure made on —— farm are the straw of 120 acres Wheat, the straw of 30 acres of Beans, 60 acres of Swedes, Turnips, Mangold Wurzel, and Carrots, averaging 20 tons per acre; these are all consumed by fattening stock in the boxes during the autumn, winter, and spring, and during summer we have 30 acres of Clover, which is fed off by sheep folded on the ground, exeept what is cut green for horses, about 50 pigs, and about 20 fattening beasts in the boxes; and as the leaves of Mangold Wurzel, the Carrots, and Turnips are the richest materials for forming a manure compost, all the leaves of our root crop are carted home and given to the stock in the yard to be picked over by them, and the remainder trampled under their feet; when these accumulate it is carted out to a place where a dunghill is to be formed, and here it is mixed with the dung of other animals.

The only animal matter we have within our reach is the excrements of the live stock kept for labour, store stock, and those fattening for the butcher; they consist of horses, oxen, sheep, and pigs. It must be remembered that the quantity of animal exerements we can use is just in proportion to the quantity of stock we keep, and the quality of it, to the quality of the food they contain; besides the 60 acres of roots and 30 acres of Beans, the stock have Oats, Peas, Vetches, Indian corn, Linseed, oilcake, and bran, in such quantities as we think necessary, according to the condition the stock are in.

Our stock consists of 9 horses, 20 beasts, from 100 to 150 sheep, and about 60 pigs, during the summer five months; and, in the winter seven months, we have 9 horses, from 40 to 50 head of beasts fattening, from 250 to 300 sheep fattening, and from about 60 to 100 pigs. Most of the urine of these animals is absorbed by the litter in the boxes, except that of the horses, which runs to the tank and is pumped over the dung-heap. *J. M.*

(To be continued.)

Home Correspondence.

Spade Cultivation.—Amongst the machinery shown at the Mechanics' Institute Devonport, are some for printing. I was presented with a paper, of which they were throwing off copies every minute; in which was the offer of a premium for the best essay on the cultiva-

tion of Dartmoor. Now as that is a field extensive enough to try something superior to our present plough or spade, I thought it a good time again to urge the matter; but then the rebuffs I have met with, when trying to reason the case with farmers, came crowding on my mind. "Expensive machinery, and intelligent men! Nonsense; at present prices too—impossible. Don't come to us theorising. What can you know about it?" This passing whilst watching the machinery, I fell into a reverie, in which I thought myself transported to the time printing was invented. Methought by the side of the printer, stood one of those, who had heretofore gained much *éclat*, by writing well and quickly. My powers of description cannot portray the look of contempt, with which he eyed the printer, whilst delivering himself of the following sally. "Here's a complicated and expensive machine. What are you doing with it?" The printer with a smile hands him a paper—the offer of a premium for the best cultivation of Dartmoor. "So you think that complicated affair necessary, do you? Why, it is like employing an elephant to carry a fly. See I will take a piece of paper, and with a pen only, produce something very superior to your advertisement." "But observe," remarked the printer, "I can print as many copies as you write words." "You can, can you, then how are all we writers to get employment, pray tell me that?" The question was not whether the printer could prove his invention to be useful or not, the prejudices of the writer blinded him. Nevertheless printing gradually made its way, although bigotry could not appreciate it. The analogy of the cases struck me. It is always difficult to overturn established opinions, and farmers have been so long nursed, that we ought not to expect them to walk well, when first placed on their own legs; or if a pun may be allowed, there should be time allowed for their under-standings to strengthen. Therefore let us add line upon line, and precept on precept. I therefore again urge some mechanic to make a machine containing many spades and forks. I have in a former paper described the sort of machine I thought most applicable to steam-power, which is, that spades and forks should be stuck round a cylinder, worked by steam-power, and propelled on a portable railway. As I then observed, I am no mechanic, therefore can only disseminate my ideas. I believe the steam-power might be shifted to suit a variety of purposes, such as threshing, grinding, the before-mentioned spade work, but more particularly to draining the land. A machine of this sort would require a clever man to guide it, and then I hope to see my pet plan carried out; that is, a man of this description to live in every farm house, who would be of still greater advantage, in making intelligent beings of the present animals, yclept ploughmen. The evening schools for adults, and village lectures, must tend to raise such a class of men. At present it is lamentable to see the shifts resorted to, in a farm-house of an evening to kill time, which might be so delightfully used in guiding the young to observe; again I say to observe, for who has such pleasing books to give instruction through as the naturalist? Nature's laboratory is always open to the inspection of the enquirer, and I believe a few years will place the farmer amongst the most intelligent, as well as the most industrious class of men; for all will allow, they are industrious, although it is often like going down a well to fetch water, instead of using the pump handle. They have this great advantage over those sedentarily employed, whether with hands or head, they can acquire health and practical knowledge whilst following their vocation; therefore study, properly guided, would in their case prove the best and most agreeable relaxation, whilst the sedentary must take exercise, and in some cases entirely refrain from all mental excitement. Perhaps some will say what connection is there between good farm machinery and this anticipated improvement in the mental condition of the farmer and farm labourer? Everything. At present their employment is so labourious, that weariness destroys the spirit of improvement. But let them be once rid of that burden, and the same dogged firmness which has enabled them to plod along so burdened, will cause them to soar aloft, when the weight is taken off; in which flight I heartily wish them God speed. *Anon.*

Mr. Wilkins's Wheat.—For many years the attacks made upon me were founded on the notion that I could not grow corn on the system I explained and always successfully practised, because it was contrary to the long cherished practice of the farmers of this country; but, as year after year my practice was always more than successful, and never failed; and as all my parishioners, nearly, had more or less adopted my system; and as it was found from yearly experience that the closer they followed my system the larger were their crops with proportionately less exhaustion of their soil; the attacks upon the system had gradually died away, and would soon have been forgotten. But now the attack is turned from my system of corn cultivation to the kind of Wheat I grew. The Vice-Chairman of that large and respectable assemblage at Mr. Mechi's annual gathering, proclaimed, that the Wheat I grew "was of a coarse quality and no better than Rye," and this assertion was received with what reporters would term thunders of applause; and it has since been industriously disseminated throughout the whole country, and has gained the more credit because the speaker may be said to be a neighbour, and therefore was presumed to know the truth of all he said on the subject. But what are the facts? In this parish alone, on my system I have grown Wheat for 13 years, and as far as I can remember, I never grew the same kinds, with but one exception, twice over; and I always grew at least three kinds, changing them every year, and one year I grew six kinds. I add also, that I always sold what I did sell in the market for the best price, but I generally sold the greater part for seed, from the supposition that the kinds I grew, from their large yields, were very prolific kinds, whereas the secret lay in the mode of cultivation only, and not in the kinds of Wheat, since I believe I changed and changed until I had grown all kinds nearly known in my neighbourhood. But last year I grew about half an acre of Egyptian Wheat from a little seed I obtained accidentally, and an account of which I published in the *Agricultural Gazette*, and I have grown nearly 3 acres again this year with equal success. Several gentlemen also have grown it this year from seed I sent them, and their accounts of its production and quality confirm all I have thought or said about it. Indeed it is a most valuable kind of Wheat, and I have no doubt whatever but its cultivation will in a few years become quite general in this country. But this year I grew in two fields three other kinds of Wheat as well as the Egyptian, and I challenge Mr. Hobbs to produce better kinds of his own stock and own growth to exhibit against them. I had a small field of Barley also seeded on my system with 2 pecks of seed an acre only, and the quality of that I will exhibit likewise against any Barley of Mr. Hobbs' own stock and own growing. In conclusion I subjoin an account of this same Wheat so harshly condemned by my friend Mr. Hobbs, copied from a note by the learned Calmet, on the 5th verse of the 41st chapter of Genesis—"Seven ears of corn came up upon one stalk, rank and good." "This is not an unusual and monstrous production, as it has often been supposed to be; a species of Wheat which grows in Egypt actually bears when perfect this number of ears on one stalk. The stem is solid, or at least full of pith, in order to yield sufficient nourishment and support to so great a weight as the ears bear, whereas the stem of our own Wheat is a mere hollow straw."—*Calmet on the 41st chapter of Genesis.* I add that this is an exact description of the Wheat I am growing; I have found in my field 16 ears on one stalk, and 4000 grains from single roots of one grain, or 4000-fold; folly alone therefore can condemn it. *George Wilkins.*

The Steam Plough.—Though I am only an old practical farmer, I have long been convinced that the old system of farming will no more suit present times than an old spinning-wheel will do now. Agricultural improvement has proceeded slowly, and is still sadly behind-hand in comparison with manufactures. Now, though it is easy to see what is wrong, it is very difficult to say what would be right. But it seems to me that the whole system of agriculture requires to be remodelled—I had almost said revolutionised, but that is an offensive word. However, instead of taking it for granted that any approved practice is perfect, or nearly correct, we should doubt its correctness, and put it to the test of proof. To begin with ploughing; we have proof that it is not so good for the crops as digging. The dragging of a wedge-like plough through a stiff wet soil is the very likeliest way to make it stiffer and wetter, by pressing the soil and case-hardening the subsoil. I have been led to these remarks by reading an excellent article in the *Agricultural Gazette* of the 21st September by C. W. Hoskyns. It confirms some indefinite ideas which had previously occurred to my mind. I had thought of the possibility of inventing a digging machine to be worked by horses or by some other suitable power; and I give my ideas to the public, hoping that they may be useful to some enterprising machine-maker. The weight of a steam-engine seems to be particularly objectionable. Power without ponderosity seems to be what is required by the farmer. The agricultural engineer should himself be a practical farmer. The principle of the hay-making machine seemed to me to be suitable for a digging machine. It might probably be made with a number of strong narrow blades, of a hollow form, like draining spits, to fly out of the drum, and be driven by stampers into the soil, as soon as ever they touched it. In this sort of way they might enter the ground, take it up and turn it over, leaving it light, by proceeding on the undug ground, and receding from that which it has stirred. This backward progress seems very essential on strong wet land, though not on that which is dry and light, and needs to be compressed. At first such a machine would of course be somewhat imperfect; but if the principle were proved to be practicable, improvements and additions would soon follow, making the machine more and more perfect. Some power far less ponderous and expensive than the present locomotive engine, seems to be requisite. But, being only a practical farmer, I merely throw out hints for the consideration of scientific men, who will not, I am sure, be above considering the opinion of *An Old Farmer.*

Irish Land Investment.—Permit me to trouble you with a few remarks on the subject of Irish land investment, and more particularly with reference to that branch of it which of all others has, I think, been least discussed, viz., the policy of encouraging the introduction into that country of the unemployed or inadequately remunerated capital, skill, and industry of the other parts of the kingdom, whereby, through her growing prosperity, the commensurate welfare of the whole community would, we all know, be greatly promoted. Another motive for thus addressing you is, that I have long been connected with an Irish land company, which, though failing in the ultimate object of its establishment, *i e.*, a profitable return to the shareholders, has not so failed from causes having the slightest identity with the question of the capabilities of the soil, but, on the contrary, has constantly afforded abundant proof that, with proper management, it may unquestionably be cultivated at an ample and in some cases a high profit. My object, then, is first to claim the attention of the capitalist, who can scarcely turn to a profitable and safe investment elsewhere, and although some few enterprising men of that class have lately purchased estates in Ireland, and thus shown their confidence in the improved state of the country, I would beg to ask the large fundholders and men of capital who desire to become landed proprietors, what are the reasons that have deterred them from following the far-sighted examples I have alluded to. Formerly no doubt the purchase of or settlement upon an Irish estate would have been a far bolder speculation than a similar venture at California; life and property being in times past anything but secure. But who will say that they are now less so than in England? He who should make that assertion would surely libel the former country, whilst provoking comparisons unfavourable to the latter. It is certainly notorious that the horrible crime of assassination has been even in later times occasionally committed in Ireland. But look at the causes which have produced these stains on the national character of this brave and generous, but calumniated people—landlords and tenants. And let me ask, will Englishmen go there to revive these bygone causes of discontent? At all events they have now subsided, and are no longer a bar to the improvement of the country, the redundant population having from various causes been greatly thinned, and being likely to remain so from continued emigration. Poor-rates being for the same reason, and the improveing state of the country, and more equitable assessments, greatly reduced; and above all, political and religious animosities being at an end; whilst land can now be purchased of the encumbered estates commissioners with perfect security of title, and other important advantages calculated to facilitate improvements, at prices too which, according to the opinions of competent judges, are, if not extremely low, at least decidedly moderate. Let us therefore hope that many more enterprising men will be found amongst the bidders for the forthcoming estates, with reference to which I may further assert, that whilst it cannot be doubted the recent calamitous visitation has considerably lowered the actual rentals, and consequently the present marketable value of land, no one acquainted with Ireland, or who can form any conception of the prospective development of its vast resources, can doubt that whatever may have been the rates of purchase hitherto (whether high or low), the present improving state of the country, which the most unpractised eye may see at a glance must, ere long, inevitably attract the spare capital of England, and occasion a considerable rise. To parties, therefore, disposed to purchase, I would say, "Buy whilst you can, at the present moderate if not low prices (being well advised in your selections); for of the certainty of profitable results from judicious purchases, sound economical management, and personal superintendence, perhaps no fact was ever established by more abundant experience and testimony, public and private, particularly from the time of the well-known reports to Government by Messrs. Griffiths, Nimmo, Edgeworth, &c., 40 years back, down to the no less celebrated report in 1845 of the landlord and tenant inquiry, known as 'Lord Devon's Commission.' And when you the purchasers have pocketed your title (which you may literally do), go to work with spirit, engrafting on your system of management firm but fair and considerate treatment of the tenants and peasantry, encouraging also settlers from other parts of the kingdom; and be assured you will have no cause to regret your position and prospects as Irish landlords." And now let me give a word of advice to the farmers of England and Scotland, who, whilst they complain of being ruined, find so few to sympathise with them—and to farmers' sons, more particularly, "Take your Saxon bone and sinew, with what capital you can scrape together, to the but half explored mine of wealth I have pointed out to you—the right arm of Britain—where undoubtedly you may do well. Your patient, toiling industry would be amply rewarded by a generous soil, farms which are held at remarkably moderate rents, and with a light taxation, as compared with that of England; the example, too, of your more mature system of farming would be highly beneficial to the country, and materially help to raise it to its proper national level." In short, it is certain that whilst Ireland would be benefited as I have stated, and by the circulation of the capital of such settlers there never was a finer opening—such a golden opportunity—than is afforded by the present transition state of that country; not merely for men of capital and enterprise, in search of large tracts or entire estates, but equally for the young farmers and graziers of England, to whom it offers opportunities and prospects of success which cannot now be looked for in this country; and, all points considered, far superior to those afforded by emigration. They who desire to acquire freeholds, but have not the means of doing so at once, might nevertheless take farms upon lease or under agreement to pay for them by periodical instalments; and I know several liberal-minded proprietors—English as well as Irish—who would gladly treat with respectable parties either way; indeed I could point out many desirable tracts, with which I am acquainted from personal inspection, where excellent farms may be had upon fair terms, and upon which industrious young men might save money, whilst the good that would accrue to Ireland in thus originating an independent yeomanry, is beyond calculation. All that the proposed settlers would have to do before striking a bargain would be to personally select the land, under good previous advice as to the locality and nature of the soil, having of course also regard to the vicinity of markets, roads (the excellence of which over even bogs and mountains will rather surprise them), and manures, the latter of which are placed by Nature so abundantly and accessible, as if to shame man for his apathy and ingratitude. But I fear you will consider I have trespassed too much upon your time, and therefore conclude by recommending the farmers and graziers to turn the matter over in their minds, and if they want to see the sort of stock the Irish pastures can produce, and which England cannot excel, to take a trip to the celebrated fair of Ballinasloe, the greatest cattle mart in the kingdom; and if, after thus seeing this interesting country and its staple productions, they do not imbibe some warmth of feeling for its welfare, they are made of far colder

materials than I am. PS. I have said nothing directly of the other great resources of the country in mines, fisheries, &c., because I conceive that they cannot be materially developed until the land has got into more extensive and efficient occupation and culture. *F. F.*

Food for Poultry.—On referring to the *Gardeners' Chronicle*, No. 22, June 1st, 1850, p. 348, Poultry Management, in column the 3d, line 14th, I find there is a mistake, viz., 20 oz. per day each of tallow cake or chandler's greaves. It is very improbable that one fowl will eat 20 oz. per day, 1 oz. per day each is quite enough, it is only given to supply the want of insects. I suppose the words ought to have been 20 oz. per day for the 21 fowls [no doubt]. *J. H.*

The Study of Chemistry.—I am induced to offer the following remarks from the perusal of a paragraph in your Paper of last week on this subject. I quite agree with Mr. Stollard that a considerable time will elapse, with the present system of education, ere the farmer will be enabled to protect himself from the gross imposition to which he is exposed; and when we consider the small amount of scientific information that would really be of great value to the farmer, I think it highly desirable that some plan should be adopted to supply so great a desideratum. I would recommend those who are conveniently situated to obtain the services of a neighbouring chemist and druggist, who would find it much to his advantage to devote a portion of time for the furtherance of such an object; and he would be enabled to supply the necessary apparatus at a moderate price, as amateurs are frequently charged exorbitantly, not being acquainted with the real value of apparatus and chemicals. I would recommend that a large portion of the latter should be made by the students; independent of the reliance to be placed upon one's own article, it affords practice in manipulation, and the study of the various compounds, and the decompositions which take place in making them, tend well to explain the principles of the science. It would be very advantageous to have a course of lectures during the winter; farmers would find an evening very profitably spent, even had they to walk a few miles for that object. As to the lecturer and director of the class, I think most towns can supply a person competent to discharge those duties. Many such persons are now to be found amongst the druggists, as ample means are now afforded for the education of that hitherto neglected class, which I cannot but think will ere long be of much service to the farmer; as those who have qualified themselves are not only initiated into the science of chemistry and its various applications, but have an acquaintance with vegetable physiology, a knowledge of which, however slight, I conceive to be of great value to the farmer. We may look with admiration to the lofty Poplar or monarch of the forest; but how few think from whence they came, or how they are nourished and supported.

> "While through the neighbouring field the sower stalks,
> With measured step; and liberal throws the grain
> Into the faithful bosom of the ground:
> The harrow follows harsh, and shuts the scene.
> Be gracious, heaven, for now laborious man
> Has done his part. Ye fostering breezes, blow;
> Ye softening dews, ye tender showers, descend;
> And temper all, thou world reviving sun,
> Into the perfect year."

I think few can contemplate upon the period so aptly described by the poet, without experiencing an anxious desire to become familiar with the processes of Nature daily going on around us, and which we so anxiously watch, but not drawing from them those lessons they are calculated to teach, until we arrive at the period alluded to by the poet, when he says,

> "Far as the circling eye can shoot around,
> Unbounded tossing in a flood of corn."

But to return to the subject of lectures: if they cannot be obtained, I would recommend meetings to be held at which papers should be read and discussed on subjects brought forward after due notice for discussion; the meetings, if duly organised and well arranged, would be productive of much benefit, as not only would the attendants gain much information by the mutual exchange of ideas and the result of each others' experience, but a taste would be acquired for reading and study, and by their union the means of acquiring information would be greatly facilitated. There would, moreover, be an object in instituting investigations and experiments, by which means an accumulation of practically useful facts would be obtained which otherwise would remain unobserved. Although it is universally acknowledged at the present day that the resources of the soil cannot be fully developed without a combination of scientific knowledge and practical skill, yet how few, comparatively speaking, come forward and devote their energies to the furtherance of an object so desirable as the combination of the above-named requirements. Great credit will be due to those who at the present crisis will come forward and exert themselves in establishing societies and meetings for facilitating the acquisitions of scientific information, and I venture to say they will receive ample remuneration, if only in the satisfaction they will experience in being conscious of having contributed their mite towards advancing the well-being of the community. *Amator Naturæ.*

Commercial Value of Human Excretæ and Peat Charcoal Manure.—Public attention has within these few years been strongly directed to the necessity of preserving and making use of those fæcal matters which, though highly valuable as manure, have hitherto been allowed, from various causes, to run to waste. Though no one has denied the value of human excretæ as manure, yet, as far as I am aware, no attempt has yet been made to determine by analysis their exact market value, and thus to compare them with other manures. The subject was thought of sufficient importance to warrant our undertaking in the laboratory an investigation of the subject. By weighing the excretions of one person for some time it was found that the average weight of solid fæces was 7 to 8 oz. avoirdupois, and the urine 3½ lbs. per diem. The weight of the latter will of course vary with the quantity of water drunk, the state of the air, &c.; but the solid materials given out in it daily will be nearly the same. The annual amounts will, therefore, be nearly 1½ cwt. solid excrement, and 11 cwt. of urine. The following tables show the composition of these substances, as determined by Messrs. Bailey and E. Cottingham.

Composition of the Solid and Liquid Excrements of Man in the natural state.

	Solid Excrement.		Urine.	
	Per cent	Per ton. lbs.	Per cent	Per ton. lbs.
Moisture	73.25	1641	97.09	2175
Nitrogen	1.94	43	.79	18
Organic matter	22.01	493	1.30	29
Inorganic matter	2.80	63	.82	18
	100.00	2240	100.00	2240

Composition of Dried Human Excrements.

	Solid Excrement.		Urine.	
	Per cent	Per ton. lbs.	Per cent	Per ton. lbs.
Nitrogen	7.25	163	27.14	607
O ganic matter	82.29	1843	44.69	1002
Inorganic matter	10.46	234	27.14	631
	100.00	2240	100.00	2240

Composition of the Excrements of one Man for one year, at the rate of 1½ cwt. of solid Fæces, and 11 cwt of Urine per annum.

	Natural.		Dry.	
	Solid Excrements. lbs.	Urine. lbs.	Solid Excrements. lbs.	Urine. lbs.
Moisture	123.0	1196.3	.....	.....
Nitrogen	3.3	9 9	3.3	9 9
Organic matter ...	37.0	15.9	4.7	15.9
Inorganic matter...	4.7	9.9	37.0	9.9
	168.0	1232.0	45.0	35.7

From the previous table it will be seen that, exclusive of water, we have 45 lbs. of dry matter in the solid fæces, and 35.7 lbs. of dry matter in the urine given out annually. The following table shows the composition of the mixed materials dry.

Composition of the mixed Excretæ, dry.

	In Annual Amount of 80.8 lbs.		Per cent.	
	lbs.	lbs.	lbs.	lbs.
Nitrogen equal to ammonia	16.	13.2	19.8	16.33
Organic matter	.....	53 0	.....	65.61
Inorganic matter	.....	14.6	.....	18.06
containing Phosph. Acid	2.67	.....	3.3	.....
	.....	80 8	.....	100.00

From a comparison with other manures in the market, it would appear that the value of 80.8 lbs. of dry solid matter is about 10*s*. In order to compare it properly with guano and other manures, we must see its compositiou when it contains 12 per cent. of moisture, the same as ordinary guano.

Composition of Mixed Human Excrements with 12 per cent. of Moisture.

Nitrogen (equal to 17.42 per cent of ammonia) ...	14.37
Organic matter	57.74
Inorganic matter (containing 2.9 per cent. of phosphoric acid)	15.89
Moisture	12.00
	100.00

In the subjoined Table the dried excretæ are compared with Rape-cake and Peruvian guano. The ammonia in the guano is calculated at 14 per cent., which is about the average.

Comparison of Dried Human Excretæ with Rape-cake and Guano.

	Rape-cake.		Guano.		Mixed Human Excretæ.	
	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.
Moisture		195.8		268.8		269.0
Nitrogen		115.4		258.6		322.0
equal to Ammonia	140.0		313.6		309	
Organic matter ...		1654.2		938 6		1293.0
Inorganic matter ...		274.6		774.0		356.0
containing Phosphoric Acid ...	43.7		224.0		64.9	
		2240.0		2240 0		2240.0

From the previous Table it will be seen that the dried excretæ are preferable to the guano and Rape-cake as far as concerns the ammonia, and superior to the Rape-cake and inferior to the guano as respects the phosphoric acid. The latter could easily be supplied by bones or coprolites. Many methods have been proposed for getting rid of the excess of moisture from fæcal matter. Among others, Mr. Rogers proposes to use peat charcoal, which not only absorbs water, but also possesses powerful deodorising properties. Mr. Rogers, by means of a proper machine, mixes two parts of peat charcoal with one of excretæ, and the resulting material is at once ready for use or carriage. The following is an analysis (by my assistant, Mr. Bailey, F.C.S) of one of the mixtures made by Mr. Rogers, in his experiments at the Mechanics' Institute, Southampton-buildings, in October last:

Peat Charcoal Manure.

	Per Cent.		Per Ton.	
	lbs.	lbs.	lbs.	lbs.
Moisture		30.66		687
Nitrogen equal to		4.89		109
Ammonia	5.92			
Organic matter and Charcoal ...		55.23		1237
Inorganic matter		.....		207
containing Phosphoric Acid ...	0.63		14	

In order to compare the peat charcoal manure with guano, we will show its composition with 12 per cent. of moisture.

	Per Cent.		Per Ton.	
	lbs.	lbs.	lbs.	lbs.
Moisture		12.00		269
Nitrogen equal to		6.20		139
Ammonia	7.5		167	
Organic matter and Charcoal ...		70.09		1570
Inorganic matter		11.71		262
containing Phosphoric Acid ...	0.8		17	
		100.00		2240

The peat charcoal manure, with only 12 per cent. of moisture, and assisted with some phosphates, would therefore be more valuable than Rape-cake, and nearly half the value of guano. *J. C. Nesbit, Agricultural and Scientific School, Kennington.*

The Agricultural Labourers.—Perhaps in no district of equal extent do the agricultural labourers work more freely and skilfully, and live more respectably and comfortably, than in the East Riding of Yorkshire; and this too without being paid higher in proportion to the quantity and quality of the work than in other parts of Great Britain. The cause may probably be found in the superior morality of the labourers, and this from their being less tempted to drunkenness than in those places where it is customary to give a daily, or frequent allowance of liquor as a part of payment, or a stimulus to labour, and thus to create or perpetuate an appetite for it, which is still more increased by the allurements of those public pests, beer-shops—those dens of dissipation, those decoys which, like the delusive vapour, lead to destruction; or where cider or other intoxicating liquors are cheap and common, the general consequence of which is extravagance, vice, and destitution. But as various causes frequently co-operate in producing the same effect, it may be added that this superior character has been greatly promoted by the boys and young men living in the houses of moral and respectable farmers; and by the labourers having their victuals in lieu of about half their wages, with steady industrious managing, and not unfrequently religious, working farmers, with whom they both work and eat, and from whom they receive many a time a good moral lesson, or religious admonition. The circumstance, too, of labourers commonly having a garden and decent and often pretty cleanly cottage, with about a rood of ground for spade culture, and sometimes a cow and land to keep her and one or two pigs, has very greatly tended to promote the comfort and respectability of the labourers of the East Riding. It may be considered an act of policy, as well as benevolence to promote these things, and with them moral and religious education, and habits of obedience, neatness, and cleanliness; for by such means the poor-rates are reduced, and the industry, skill, morality, and contentment of the present and rising generation greatly promoted. *An Old Farmer.*

The Wheat Crop.—On going over a piece of drilled Wheat this morning, I observed the rows full of gaps, many of them a yard long; on examining the cause, I found grain after grain eaten as to the germ by the enclosed insect, which had rolled itself up in the hole, you may perceive. What is the name of the animal? it seems a species of hundred-legged monster. The ground must be full, as half the seed is destroyed by them. Here my dibble comes into play; without it I should be obliged to have the crop drilled again. I may mention that the crop is not drilled with the common drill, but by a drill which drops the seed at defined intervals in the rows. This crop was got in the 5th of September; supposing it was left to the end of October, the usual time about here, it would have been impossible to have drilled it again in time. My opinion has been for a long time that Wheat should be got in immediately after harvest, and every time it is high enough it should be eaten down by sheep before winter, particularly on light land, and that no artificial manure should be put on till spring. I think that when the manure is put in with the seed it excites the growth of the plant unnaturally, and renders it liable to after complaints; I never give exciting food to any young organised being, but wait till it is in a state for cramming. With respect to Turnips, Swedes, and Mangold Wurzel, I conceive that, after the heat has gone, there are no fattening properties formed in the roots; they increase in bulk, but it is watery food that is formed after October. I have tested my idea with respect to adding a month or six weeks to our summers, by keeping the earth between the rows constantly moist and in a pulverised state by frequent stirrings. The roots grown under these circumstances are not only larger than they would otherwise have been, but they contain more nourishing qualities, having obtained their bulk during the heat of summer. I have also another idea, that the seed of all these roots may be sown in April, and the plan I adopt to prevent the plants running to maturity is to stir them frequently; this I find cuts off the roots, which seem to cause the plants to run to seed, as it is called. I have

found this also among all plants, Wheat, Barley, &c., which when late hoed or stirred have a tendency to throw out fresh shoots instead of forming seed. What do you think of manuring a piece of land highly, and sowing Oats for hay instead of Clover or seeds, so as to get double the crop that Clover will produce, and a food which cattle prefer to Clover? Do you know that if Swedes or Turnips be given to cows immediately they are milked, the butter does not taste of them, particularly if the crown be cut off? *S. Newington.* [The growth of roots in September and October is, in our opinion, the most important part of them. Scottish crops of roots are so good because of the cooler climate in which they grow. About the insect, see "Notices to Correspondents."]

Sandridge Farm.—Having noticed some few months since an article in the *Agricultural Gazette*, written by a Scotch friend of Mr. Hutchinson, bailiff to Mr. Kinder, of Sandridge Bury, Herts, I was led to take some little notice, on my way to the show at St. Alban's, of the state of the farm he manages, or at least of such parts of it as may be seen from the road. It is evident from the eulogies, without exception, bestowed on his system of management, in the letter referred to, either that Mr. Hutchinson could not have taken his friend into the field of seeds adjoining the Sandridge lane, in which there is standing at present as fine a crop of Docks as I think can be found in the county, all of which have shed their seed, to say nothing of a fair allowance of Thistles; or else, that the Scotch gentleman, not being accustomed to see Docks, &c., grow, did not recognise them for noxious and pernicious weeds, which no good husbandman would allow to flower and shed their seed, while he possessed the means of preventing it. I should not have been led to notice the state of the field, had not this friend of Mr. Hutchinson's held him up as a pattern to the farmers of Hertfordshire, in general, without, as I think, due consideration of the state of Mr. Kinder's farm throughout, and without sufficient knowledge of the management and skill of very many farmers in the county. *A Hertfordshire Farmer.*

Calendar of Operations.

SEPTEMBER.

Dorset Farm, *Sept.* 30.—We have got to the close of the agricultural year, and in looking back upon it, we have no reason to complain. The weather has upon the whole been favourable, and the Wheat crop, with some slight exceptions, is a fair average; there has been a little blight in some parts, although not to any extent near this, and it has been all harvested in very good order. Barley is about an average crop, but the quality is hardly so good as formerly. The crop of hay in water meadows has been good, but that on dry ground is light, as we had some very dry weather in June, which stopped its growing; but, upon the whole, we have a very good supply of it for the winter. Turnips are generally above an average crop. I do not think that I have ever seen a better crop in this locality, and I have no doubt it is owing to the extra quantity of superphosphate of lime used. This manure is now beginning to be estimated at its proper value, and I trust that we will all guard against being imposed upon by a spurious article; if we open our eyes, perhaps we may find that it is not in all cases what it ought to be. I, in my simplicity, have always thought that it was composed of bones and sulphuric acid and nothing else—is it so? because, if it is not, it ought to be, as any other materials such as chalk, or ashes, or even guano, we could mix with it ourselves in the proportion that we think best. It is true that we do not possess chemical knowledge sufficient to instruct us in the character of manures best adapted to our circumstances, but surely we must be allowed to be as good judges of what the soil that we are working requires as those who never saw it; and I cannot help thinking that it would be well if farmers would get into the way of making these things themselves. There is no magic in the operation. We may not make it nominally so cheap as we can buy it, but there is no reason why we may not—and make it as good. The Potato crop has turned out more favourably than we expected, the proportion of diseased ones in ours is small and the crop is fair, and the quality is better than it has been for several years. Our work is now sowing Rye and Vetches, part of which is in, and we have begun ploughing for Wheat. We have had the weather extremely dry since harvest, and were unable to plough up the lea until within these few days, that we have had a good fall of rain. We have got up the best of our cattle in the house on Turnips and hay, and they will soon be all in at night, as the weather is getting rough and cold. Our sheep are all getting Turnips part of the day. We shall commence Wheat sowing this week, and we shall soon begin to store the Mangold Wurzel. Our dairy cows are still having nothing but Grass; but we shall have to give them a little hay, by night, soon, and keep them in the house. *G. S.*

Lammermuir Sheep Farm, *Sept.* 30.—The whole of our lambs have now been disposed of, and the last lot will be removed in a few days. The Cheviot cast ewes are also sold and away, and the black-faces will be drawn, and part of them disposed of as soon as possible. On the whole, we have made about the same prices as last year, and when contrasted with grain farmers, we must say that stock masters have comparatively little ground for complaint. Our stock of rams of different breeds is now laid in, and most of the cast sheep disposed of. In the course of a fortnight the rams will be put into a small well-fenced enclosure, both to keep them out of mischief, and to have them in fresh condition before being turned among the ewes. We intend beginning the bathing of the sheep about the 29th of October, so that this operation may be completed and the jackets put on the hogs before the 22d November, when the rams are put to the ewes. The cows have been brought into the byres at night since the cold weather commenced, returning to their pasture during the day. We may notice that, though the past autumn has been highly favourable for our pastures, yet from the prevalence of heavy dews, foot-rot has been unusually prevalent on soft grounds. Frequent dews and mists seem, indeed, to induce this troublesome disease as readily as continued rains. We find cleanliness and strewing the sorsing pens with caustic lime to be the best preventative, and great care on the part of the shepherd in paring the hoofs, and applying caustic to the affected parts, the best cure. A change of weather having taken place on the 20th, harvest operations have since been greatly interrupted, and we have still about 15 acres of late Oats to cart. Attending to harvest work, and carting out hay (which has been ricked for some time) to sheltered places on the hills, for the use of the sheep during snow, have occupied our farm labourers during the past month. During October they will be similarly employed, and when these operations and some other odd jobs—which have been lying back—have been completed, the ploughing of stubbles will be commenced. We purpose laying all the summer made manure on the stubble now, and ploughing it in immediately. Our Turnips, on ground similarly treated last autumn, with the addition of 2½ cwt. of Peruvian guano when sown, are much superior to those which received the same quantity of each kind of manure, spread in the drills at the usual time. Besides, the former method saves much time during Turnip sowing, when a few days gained is of the utmost consequence. Of course it can only be practised where the ground is clean. Our Turnips have been greatly refreshed by the recent rains, and are an excellent crop. Harvest is generally finished in our neighbourhood. *A Lammermuir Farmer.* [Your notices generally come one day too late. Will you kindly post them a day earlier.]

Notices to Correspondents.

Address: *An Essex Labourer* would oblige us by his address.

Cyclopedia of Agriculture: *W W R P.* It is the same work. Twenty-four numbers is the limit we shall honestly *endeavour* to keep within.

Journal of Agricultural Society: *Member of Royal Ag. Soc.* You may communicate with A. B., Polytechnic Magazine Office, 4, Beaufort-buildings, Strand.

Permanent Pasture: *H Footman.* Pare and stifle-burn your Wheat stubble, and plough up before winter; cultivate and clean it well, and manure heavily for Turnips. Feed them off on the land if it be dry enough, and plough up for Barley crop, which put in with a thin seeding early in March, and when it is up sow the following mixture of seeds in damp weather, and bush-harrow it into the land:—Alopecurus pratensis, 1 lb.; Avena flavescens, 1 lb.; Dactylis glomerata, 2 lbs.; Festuca duriuscula, 2 lbs.; F. heterophylla, 1 lb.; F. rubra, 2 lbs.; Lolium italicum, 3 lbs.; L. perenne, 5 lbs.; Poa nemoralis, 2 lbs.; P. pratensis, 1 lb.; Medicago lupulina, 1 lb.; Trifolium pratense perenne, 3 lbs.; T. repens, 4 lbs. Total, 28 lbs. You can get the kinds from the seedsmen.

Poultry Disease. Since the last "Poultry Miscellany" was written, information has been given me from a trustworthy quarter, that about half a teaspoonful of cod-liver oil in which a small pinch of cayenne pepper has been mixed, is an efficacious remedy for the sneezing and "pip" crying disease. Nearly a teaspoonful is a dose for a large adult bird; for younger and smaller patients, less in proportion. Remembering that cod-liver oil was a new invention, and fearing that this medicine for fowls might be of the same fashionable and ephemeral nature that Mustard seed, brandy and salt, &c. &c., have been for men and women, I inquired if *any* oil would answer the purpose, and what oil had been thus used before that from cod's liver came into vogue. The answer was, that train or whale oil had been so employed. At the same time a correspondent writes, "I have found a head (a *clove* is meant) of Garlic the most efficacious remedy." Both these remedies are, of course, empiric; still they may be worth trying. *D.*

Sundries: *W H M.* Too late for this week.

Turnips: *A B.* Dale's Hybrid may be depended on in ordinary frosts—and with oilcake you can put bullocks on Turnips from Grass without any falling off. Get them accustomed to the Turnips by bringing a few to them in the field.

Markets.

COVENT GARDEN, Oct. 5.

Vegetables are abundantly supplied. Hothouse Grapes and Pine-apples are plentiful, especially the former. Peaches are less abundant, and Nectarines are over. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent in great abundance. Filberts are dearer. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are good and cheap. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce, as are also French Beans. Cut Flowers consist of Heaths, Pelargoniums, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosissima, Japan Lilies, and Roses.

FRUITS.

Pine-apples, per lb., 3s to 5s	Lemons, per doz., 1s to 2s

HOPS.—Friday, Oct. 4.

Messrs. Pattenden and Smith report that the demand for new Hops continues very brisk, at improving prices. Duty, 215,000*l.*

COAL MARKET.—Friday, Oct. 4.

Holywell, 15s. 6d.; Eden Main, 15s. 6d.; Wallsend Haswell, 17s.; Wallsend Stewart's, 16s. 9d.; Wallsend Tees, 16s. 6d.—Ships at market, 202.

SMITHFIELD, Monday, Sept. 30.

The number of Beasts is very much smaller than on Monday last, consequently trade has improved. The choice qualities have in some instances exceeded our top quotation. The supply of Sheep is also smaller; trade is, however, slow, and although the best kinds are rather dearer, it is exceedingly difficult to obtain an average advance. Good Calves are rather scarce, and about 4d. per 8 lbs. dearer. From Holland and Germany we have 868 Beasts, 4970 Sheep, 94 Calves, and 81 Pigs; from Scotland, 10 Beasts; and about 2000 from the northern and midland counties.

Per st. of 8 lbs.—	s. d.	s. d.
Best Scots, Herefords, &c.	3 8 to 3 10	
Best Short-horns	3 4 — 3 8	
2d quality Beasts	2 8 — 3 0	
Best Downs and Half-breds	3 10 — 4 2

Calves	... ... 2 4 — 3 8	
Pigs	... ... 3 4 — 4 4	

Beasts, 3703; Sheep and Lambs, 25,310; Calves, 188; Pigs, 500.

Friday, Oct. 4.

The number of Beasts is large; however, for the best kinds there is inquiry at about Monday's quotations, but second-rate are lower. The supply of Sheep is a fair average; trade is dull, but the choicest kinds are not lower. The supply of Calves has considerably fallen off, but the demand is too limited to advance prices. From Holland and Germany there are 327 Beasts, 1780 Sheep, 110 Calves, and 21 Pigs; 500 Beasts from the northern and midland counties; and 93 Milch Cows from the home counties.

MARK LANE.

Monday, Sept. 30.—The supply of Wheat from Essex this morning was moderate, from Kent large; little progress could be made with sales until a decline of 1s. to 2s. per qr. was submitted to, at which reduction a large proportion of the latter remained unsold late in the day; the condition is inferior to what it has hitherto been. Business in foreign is extremely limited, and prices must be considered nominal.—The value of fine malting Barley is fully supported; in foreign no alteration.—Beans remain as last quoted.—Peas are the turn cheaper.—There has been a fair sale for Oats at our quotations.

Friday, Oct. 4.—The supplies of grain, both English and foreign, since Monday, have been moderate, excepting foreign Wheat, of which the arrival is considerable. The little English Wheat fresh up for this morning's market could only be disposed of at a decline of 1s. per qr.—Beans and Peas are unaltered in value.—Barley and Oats met a fair sale at late rates.—Flour is difficult of disposal, except at a slight reduction in price.

Liverpool, Friday, Sept. 27.—Beyond a few parcels of Wheat and Oatmeal from Ireland, we have received scarcely anything worth naming thence or coastwise since Monday last; the supplies from abroad, within the same period, are likewise rather light compared with the superabundant importations of Wheat and Flour during the two preceding weeks. At our market this morning we had a liberal display of samples. The tone of the Wheat trade was languid, and prices of all descriptions were nominally a little depressed in value. Barley, Malt, Beans, and Peas, continued to be held at late rates, although in these active business was apparent to-day. Old Oats being scarce and in request were quite as dear as on Tuesday, whilst new were dull and the turn lower.——Tuesday, Oct. 1.—This day's market was thinly attended by the local trade, and we had fewer buyers than usual from the country, so that with a superabundance of Wheat offering on sale, business proceeded very slowly, and to effect transactions of even a limited nature both old foreign and new Irish must be quoted fully 2d. per bushel lower on the week. Malting and grinding Barley, as well as Beans and Peas, without variation in value, but the trade languid for each. New Oats declined 1d. per 45 lbs., and Oatmeal 6d. per load; but for old samples of both we continue our previous quotations. Yesterday a considerable quantity of Indian Corn was taken for shipment to Ireland; to-day the transactions on the spot are not so numerous, but the article is very firmly held, and floating cargoes are readily saleable at very full rates.

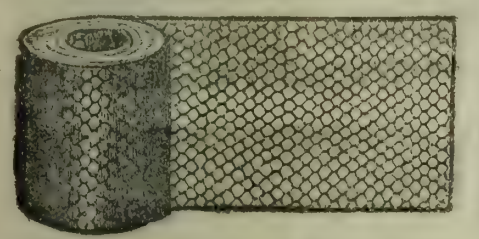
HARTLEY'S PATENT ROUGH PLATE GLASS.

JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS. Cut to order in panes of

8 by 6	and under	10 by 8	at 4½*d.* per foot.
10 by 8	,,	14 by 10	at 5*d.* ,,
14 by 10	,,	1½ foot, or sizes not exceeding 20 inches long	at 5½*d.* ,,
1½ foot	,,	3 feet, or sizes not exceeding 30 inches long...	at 6*d.* ,,

PACKED IN BOXES of 50 feet each.

6 by 4 and 6½ by 4½...10*s.* 6*d.* | 8 by 6 and 8½ by 6½...18*s.* 6*d.*
7 by 5 and 7½ by 5½...12*s.* 0*d.* | 9 by 7 and 10 by 8 ...15*s.* 0*d.*



We do not pledge ourselves to execute large orders for small squares at the above prices, but only as far as they turn up in cutting. Should any quantity of small squares be required, a special contract is necessary.

MILK PANS 2*s.* to 6*s.* each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps, 3*s.* 6*d.* per dozen; Pastry Slabs, Hyacinth Glasses and Dishes Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d.*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

From the *Gardeners' Chronicle*, December 8, 1849:

"As for the article substituted for Rough Plate, and which is actually in the market for the purpose of imposing upon gardeners, it is wholly unfit for any horticultural purpose. The best samples of it which we have yet seen is sold by Mr. JAMES PHILLIPS, 116, BISHOPSGATE STREET, LONDON."

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
1⅝-inch ,, light ,,	...	8 ,,	6 ,,
1⅝-inch ,, strong ,,	...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15 0
Do. of 100 yards, 24 ins. wide	..	5 0 0
Do. of 100 yards, 30 ins. wide	..	6 5 0
Do. of 100 yards, 36 ins. wide	..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

THE HIPPOPOTAMUS, presented to the Zoological Society by the Viceroy of Egypt, is exhibited daily at their Gardens in the Regent's-park, from 11 to 4 o'clock. Visitors desirous of seeing the animal in the water are recommended to go early. Admission 1*s.*; on Mondays, 6*d.*

DROITWICH UNION.

SCHOOLMASTER AND SCHOOLMISTRESS WANTED.—NOTICE is hereby Given, that the Guardians of Droitwich Union will, on WEDNESDAY, the 16th day of October next, at their Board Meeting, proceed to the Election of a SCHOOLMASTER and SCHOOLMISTRESS, for the Droitwich Union Workhouse School. Candidates must not be less than 25 years of age, and will be expected to be not only competent to instruct the children in the elements of those branches of learning which are taught in the school, but also to be thoroughly versed in the principles of industrial training, as approved and recommended by the Committee of Council on Education, and practically acquainted with the mode of inculcating the same. The parties appointed must be able to pass the examination of her Majesty's Inspector of Schools, and the Election will be subject to the approval of the Poor-law Board.

Salaries proportioned to the competency of the teachers elected, which will be tested by examination, will be given of not less than 35*l.* per annum, together with such rations as the house affords, and washing, for the Schoolmaster; and of not less than 25*l.* per annum, together with such rations as the house affords, and washing, for the Schoolmistress, if respectively duly qualified.

Candidates are requested to send in, free of expense, their applications in their own handwriting, with Testimonials addressed to "The Clerk to the Guardians of the Droitwich Union, Droitwich," and superscribed "Application for the Office of Schoolmaster," or "Schoolmistress" (as the case may be) on or before Tuesday, the 15th day of October next.

No applicant need attend before the Board unless officially written to for that purpose.

By order of the Board. HENRY BEARCROFT.

Board Room, September 25.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by JAMES PHILLIPS and Co. (he sole agents), 116, Bishopsgate-street Without, London.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm-servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

EXHIBITION OF 1851.—NOTICE TO EXHIBITORS is hereby given, that Her Majesty's Commissioners have fixed the 31st of October, as the LAST DAY for RECEIVING APPLICATIONS FOR SPACE from the different LOCAL COMMITTEES of the United Kingdom, the Isle of Man, and the Channel Islands. Intending exhibitors failing to give due and sufficient notice to the nearest Local Committee, cannot be assured that their claims for space will receive any consideration. (Signed) M. D. WYATT, Secretary.

CLARKE STREET, BRISTOL.

TO AGRICULTURISTS, IMPLEMENT MAKERS, WHEELWRIGHTS, EMIGRANTS, TIMBER MERCHANTS, IRON MERCHANTS, CONTRACTORS, ENGINEERS, AND THE PUBLIC GENERALLY.

MESSRS. BARNARD, THOMAS, AND CO., in consequence of the Dissolution of Partnership of Messrs. Stratton, Hughes, & Co. (Successors to Mr. Richard Stratton), Manufacturers of WHEELS, CARTS, WAGGONS, and AGRICULTURAL IMPLEMENTS, will have the honour of submitting for Sale by Public Auction, in lots, without reserve, on THURSDAY, the 17th of October, 1850, and following days of business, until all is sold, the Valuable and Extensive Manufactured and Unmanufactured STOCK, Plant, Machinery, Founders', Wheelwrights', and Smiths' Tools of this first-rate Establishment; also the Counting-House Fixtures and Fittings, Agricultural Books, Two Valuable Milch Cows, One Heifer Calf; Levelling and Surveying Apparatus, by the most eminent makers; Travelling Britzka, Five Cab Phaetons, and a great variety of Miscellaneous Effects.

On WEDNESDAY, the 23d of October, will be offered for Sale by Auction, on the Premises, at 2 for 3 o'clock precisely, the valuable LEASE of the said PREMISES, for the remainder of a term of 21 years, from Michaelmas 1848. The Plant, Machinery, Tools, &c., can be had with the Lease at a valuation, if desired; otherwise they will be Sold by Auction, in lots, as hereinbefore stated, and in the order named in the Catalogues. At the same hour and place will be submitted for competition, the PATENT in Stratton's Wrought Iron, and that in Read's Subsoil Plough; and also the Registrations of Stratton's Tumbler Cart and Stratton's Cylinder Cart.

Catalogues will be ready for delivery on and after Monday, the 7th of October, at 2*s.* 6*d.* each, at the Auctioneers' offices, or on the Premises; and the whole of the Effects may be viewed from that day until the day of sale, between the hours of 10 and 4 o'clock.

Bills at Three Months' date, with approved security, will be accepted for all purchases above 50*l.*

For any additional particulars, as regards the Lease or Patents, application to be made to J. BABKER, Esq., Solicitor, Broad-street, Bristol; or, as to the Stock, to the Auctioneers, Albion Chambers, Bristol.

INTERESTING FACT.—The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. "Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'Rowland's Macassar Oil,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.—The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine-comb unnecessary. Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle.

*** Each bottle of the genuine article has the words ROWLAND'S MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

PRICE FOURPENCE. OF ANY BOOKSELLER.

ANOTHER SUFFERER FROM A LIVER COMPLAINT CURED BY HOLLOWAY'S PILLS.—The Wife of a respectable tradesman, residing in the neighbourhood of Thrapston, was suffering for more than two years from a severe liver complaint, during which period she received the best medical advice, but without deriving the slightest benefit therefrom. She then made trial of Holloway's Pills, and by their use alone she has been restored to perfect health. The name of the party cured is not made public, but Mrs. Collier Bookseller, Thrapston, can vouch for the authenticity of the case. These pills are also an infallible remedy for indigestion, bilious attacks, headaches, and all disorders of the stomach.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

ANOTHER CURE OF COUGH AND HOARSENESS by Dr. LOCOCK'S PULMONIC WAFERS.—"Parliament-street, Liverpool: Sir, I had been troubled with a cough and hoarseness for nearly two years, without relief, when I was induced to try Locock's Wafers, the effects of which were soon visible, for one large box (2*s.* 9*d.*) has quite cured me. I have since recommended them to several of my friends, and they also have experienced the greatest relief from them.—J. WILLIAMS." Witness, M. P. Roberts, chemist, Ranelagh. They have a pleasant taste. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box.—Agents, DA SILVA and Co., 1, Bride-lane, Fleet-street. Sold by all medicine vendors.

Also Dr. LOCOCK'S FEMALE WAFERS, highly recommended to ladies, have no taste of medicine. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box. All pills under similar names are counterfeits.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

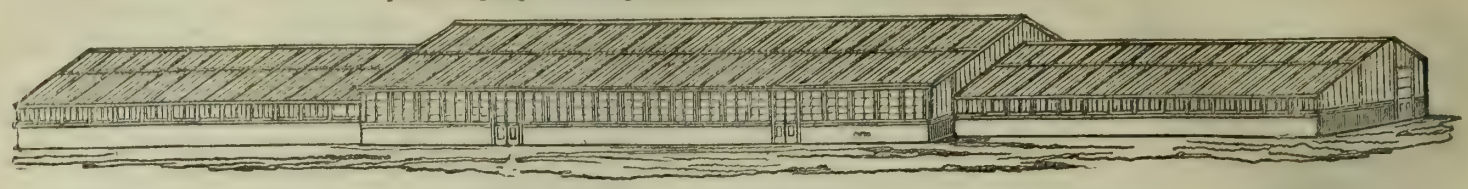
CAUTION.—Beware of the words "From METCALFE'S" adopted by some houses.

THE BLOOD.—Our bodies have been entirely formed, *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame; and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*

PARR'S LIFE PILLS.

It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.

None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the directions.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.



A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for Softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

RARE ORCHIDS FROM THE BRAZILS.

MR. J. C. STEVENS has just received, in excellent condition, a small, but very select parcel of ORCHIDS, from the Organ Mountains, in Brazil, consisting of fine masses of Cattleya marginata, the rare Miltonia cuneata, and a new species of Lælia with orange flowers, Huntleyas, &c. They will be sold by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY next, 11th October, at 12 for 1 o'clock.—May be viewed on the morning of sale, and Catalogues had.

RHODOTHAMUS KAMTCHATICUS, A NEW AND BEAUTIFUL HARDY SHRUB.

MR. J. C. STEVENS has received instructions from Messrs. Loddiges, of Hackney, to offer for competition, on FRIDAY, October 11, at his Great Room, 38, King-street, Covent Garden, the Entire Stock of the new and beautiful hardy shrub RHODOTHAMUS KAMTCHATICUS, figured and described in "Paxton's Flower Garden" for the present month, consisting of from 80 to 100 fine Plants, in lots, unless a suitable offer should be made for the whole at the time of sale. May be viewed on the morning of Sale, and Catalogue had.

HATTON NURSERY, NEAR HOUNSLOW, MIDDLESEX.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

20,000 Scarlet and other Rhododendrons, 20,000 Ghent and other Azaleas, 2000 Andromedas, 6000 Kalmias, 2000 Hardy Heaths, 1000 Daphne Cneorum, 3000 Cedar of Lebanon, 1 to 4 feet, in pots, 300 Pæonia arborea; also a large quantity of Seedlings of sorts.

MESSRS. PROTHEROE and MORRIS are directed, by the Executors of the late Mr. John Ronalds, to offer to an unreserved sale by Auction, on the premises, Hatton Nursery, near Hounslow, Middlesex, about 1½ mile from the Feltham Station, on MONDAY, October 14, and following day, at 11 o'clock, the whole of the valuable NURSERY STOCK, consisting of a large and rich assortment of American Plants, Evergreens, and Deciduous Shrubs, comprising Laurels, Irish Yews, Pinus of sorts; Spruce, Scotch, and Larch Firs; Lime, Alder, Ash, Plane, a large quantity of Quick, three fine specimens of Cedrus Deodara, 8 to 10 feet, &c.—May be viewed prior to the sale. Catalogues had (6d. each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

NB. The whole of the valuable Stock of the Butts and Toolans Nurseries will be sold by Auction, on Monday, Oct. 21, and following days.

A LARGE AND IMPORTANT SALE OF EVERGREENS.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. J. Smith to submit to an unreserved Sale by Auction, on the premises, Dalston Nursery, Middlesex, on THURSDAY, October 17th, and following day, at 12 o'clock precisely, the whole of the valuable EVERGREENS, comprising fine-grown plants of variegated Hollies, Aucuba, Box, Laurestinus, Laurels, Phillyreas, Scarlet Aubutus, Bay, Rhododendrons, Azaleas, Lilac, Ivies, Brooms, and Clematis in pots, together with the remaining Greenhouse Plants. May be viewed, and Catalogues had, one week prior to the sale (6d each, returnable to purchasers) on the premises; of the principal seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, October 11th, a superb Collection of CARNATIONS, PICOTEES, and PINKS; also about 100 rows of very choice TULIPS, with a few first-rate Double and Single HYACINTHS, CROCUSES, &c. &c. May be viewed the morning of sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

HENDON NURSERY.—TO NOBLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed to submit to public competition by Auction, on the premises, Mill Hill, Hendon, Middlesex, near the King's Head Inn, on WEDNESDAY, October, 9, 1850, at 11 o'clock (by order of the proprietor, in consequence of a portion of the land being required for other purposes), the well-selected NURSERY STOCK, consisting of fine EVERGREENS and ORNAMENTAL TREES; viz., Laurel, Portugal Laurel, Box, Aucuba, Holly, Rhododendron, Laurustinus, Broom, Daphne, Arbor-Vitæ, Privet, Bays, Phillyrea, Alaternus, Standard Roses, Sweet Briar, Guelder Rose, Altœa frutex, Laburnums, Elm, Lime, Chestnut, Oak, Beech, Birch, Sycamore, Mountain Ash, Weymouth Pine, Scotch Spruce and Larch Fir, Poplar, Standard Cytisus, White Jasmine, fine Mulberries, Gooseberries, and Currants, Strong Quick, &c.—May be viewed prior to the sale. Catalogues had on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT TO SEEDSMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE and MORRIS have received instructions from the assignees of Mr. Charles Bunyard (a bankrupt), to offer to public competition by Auction, on the premises, Nash and Hicks's Warehouse, Horsleydown, about the last week in October, the whole of the valuable SEEDS AND IMPLEMENTS IN TRADE, viz., Sacks, Bags, Weights and Measures, &c.—May be viewed, and Catalogues had of Wm. Whitmore, Esq., official assignee, Basinghall-street; of Messrs. Marten, Thomas, and Hollam, Solicitors, Mincing-lane, London; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

FITZROY PARK NURSERY, HIGHGATE.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will Sell by Public Auction, on the Premises, Fitzroy Park Nursery, Highgate, near the Gate House, on THURSDAY, Oct. 10th, 1850, at eleven o'clock (by order of the Proprietor, in consequence of the land being required for building), the thriving NURSERY STOCK, comprising 2000 Laurels from 6 to 8 feet, 6000 Aucubas from 1 to 4 feet, Green Hollies, Cedar of Lebanon, Portugal Laurels, Sweet Bays, Spruce Firs, Red Cedars, Laurustinus, Limes, Evergreen Oaks, Rhododendrons, Azaleas, Kalmias, &c. Also Standard and Dwarf-trained Peaches, Apricots, and Nectarines, together with a large quantity of Chrysanthemums, Fuchsias, &c. &c., in pots.—May be viewed prior to the Sale. Catalogues had on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

FARMS TO LET AT MICHAELMAS NEXT.

MR. HURLEY, Farm and Estate Agent, is instructed to let the following, amongst other desirable farms: No. 1.—TWO EXCELLENT FARMS in Herts, 26 miles from London, and close to the Great Northern Railway, consisting of 526 and 287 acres respectively, admirably adapted for Turnips, Wheat, &c., and for carrying a large flock. Rents, 18s. and 21s. per acre; superior residences and buildings. No. 2.—A first-rate Farm of 160 acres, near Windsor; good house, &c. No. 3.—A capital Farm at Enfield, of 105 acres, equally divided; superior residence and buildings. No. 4.—An excellent Farm, with gentleman residence, &c., with 100 acres of very capital land, equally divided; situate in Essex, within 4 miles of the Harlow station. No. 5.—A good Farm in Sussex of 230 acres, well drained, and adapted to the growth of Wheat and Beans, but not of heavy tillage. Rent 20s. per acre, tithes, &c., 6s. Good Premises; tenant may propose his own terms. No. 6.—A small Farm of 61 acres, in Sussex, with Farm-house and two Cottages. Rent, on lease, 50l. a year. No. 7.—A capital Farm, in Kent, of 220 acres. Rent 135l. a year, tithe 30l. Two capital Farms, in Surrey, of 400 and 170 acres. Rent and tithes low; the latter tithe free. Another, in same county, of 600 acres; rent and tithes very low. Also a good Farm at Fulmer, Bucks, of 90 acres, nearly equally divided. Also a small Meadow Farm, of 60 acres, with good Residence and Buildings, situate near Bristol, and a Railway station. Likewise a good Farm of 200 acres, 45 Meadow; Good Premises, near the Hatfield Station, Herts; and three excellent Farms in Berks, near the Great Western Railway, of 400, 530, and 500 acres, respectively. Rents to meet the times. And, lastly, three Farms, in Kent, consisting of 155, 123, and 76 acres respectively; rents low.—Apply for terms (inclosing two stamps) to the Auctioneer, 62, Nelson-square, Blackfriars-road, London.

NORTH WALES—IN THE MAGNIFICENT VALE OF CLWYD.

MR. HURLEY is instructed to sell, by private treaty, a most desirable FREEHOLD FARM ESTATE, situate in the centre of this very beautiful Vale, the scenery of which needs no eulogium. The residence is adapted to a respectable family, and buildings good. The land comprises 118 acres of superior Meadow and Arable, in a good state of cultivation. The Estate is surrounded by three distinct turnpike roads—is adjacent to many family mansions, and joins Llanerch park and grounds, and from its commanding position, offers a fine site for building an elegant villa residence. It lies 1½ mile from St. Asaph Cathedral (where English service is performed), and within eight miles of Rhyl, a justly celebrated watering-place, and a first-class station on the Chester and Holyhead Railway. The shooting and fishing are excellent; and Lord Mostyn's hounds are in the vicinity. For plans, and to treat, apply (enclosing 4 postage stamps) to Mr. Hurley, Land Agent and Auctioneer, 62, Nelson-square, Blackfriars-road, London.

LEICESTERSHIRE.

MR. HURLEY is instructed to SELL, by Private Contract, a very excellent FREEHOLD FARM ESTATE, tithe free, in the above county, with a large and gentlemanly Residence, capital Buildings, and 142 acres of superior Arable and Meadow Land, near the market towns of Loughborough, Derby, and Leicester; bounded by good roads, and within easy access of a railway, and in the immediate vicinity of three packs of hounds. There are valuable mines of Coal upon the Estate, which may be worked at an exceedingly low cost, from the facilities offered.—For Terms, Plans, and further particulars, apply (enclosing four stamps) to Mr. Hurley, 62, Nelson-square, Blackfriars-road, London.

IMPORTANT SALE OF 1000 CAMELLIAS, 200 AZALEA INDICA, LARGE COLLECTION OF STANDARD ROSES, LILIUMS, AND DUTCH BULBS.

MR. HASLAM begs to announce that he will, on WEDNESDAY, the 9th of October, and two following days, sell as above, at the Auction Mart, Bartholomew-lane, London. Catalogues to be had at the Mart, and of the Auctioneer, South Essex Nursery, Epping, Essex.

TO BE LET, a FARM of 83 acres—60 Arable and 21 Meadow—with good Farm-house, Orchard &c.; situated 1½ mile from the Edenbridge Station of the Dover Railway, with immediate possession. Rent 60l. a year.—For particulars apply to Mr. M'Laren, Limpsfield-lodge Farm, near Godstone, Surrey.

ELEY and Co., Improved Pit and Hothouse Builders, Hot-water Apparatus Manufacturers, and Inventors of the Double Saddle Cast-iron Boilers, proved the most superior. Can be highly recommended by the Nobility. Prices equal to all competition.—Address, City-road, near the Toll-gate, London; Manufactory at Old-street.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. Nesbit, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of Strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London

---

In 1 Vol., 8vo, price 12s. cloth,

JOHN B. SMITH begs most respectfully to inform the Nobility, Gentry, and the Trade that his stock of AZALEA INDICAS are very fine this season, and well set for bloom, and comprise several new and striking novelties. The new yellow varieties of Rhododendrons are very strong and fine, as also Rhododendrons in general, Camellias, Roses, Lilliums, &c., all offered at the very lowest ebb of price; Catalogues of which may be had by inclosing a postage stamp.
Norbiton Nursery, Kingston, Oct. 12.

HOLLYHOCK, "QUEEN OF ENGLAND."

J. CHATER AND SON beg to announce that they are prepared to send out good plants of the above, at 5*s.* per plant, or with it Eleven other distinct show flowers for 35*s*; also 12 fine named varieties for 15*s*. For description see List, which may be had on application.
Choice Hollyhock Seed ... ... 2*s.* 6*d.* per packet.
Very fine, from named flowers ... 5 0 „
J. CHATER and SON, Haverhill, Suffolk.

CALCEOLARIAS AND PANSIES.

HENRY MAJOR, Knosthorpe, near Leeds, can supply healthy plants of Twelve very distinct and beautiful CALCEOLARIAS, including two or three Seedlings not yet out (all of them his own seedlings), for 1*l.* post free. Also the following first-rate show PANSIES, for 1*l.* post free, viz., France Cycole, Mrs. Beck, Queen of England, Hebe, Madame Sontag, Magnificent, Staffordshire Hero, Helen, Blue-eyed Maid, Hector, Masterpiece, and Sir J. Franklin. Very choice Calceolaria and Pansy Seed, 2*s.* 6*d.* per packet.
H. M. respectfully requests that all orders be accompanied by a Post-office order.

LAWSON'S ANNAT GOLDEN GAGE PLUM.

PETER LAWSON AND SON, Edinburgh, offer dwarf, strong, and healthy trees at 10*s.* 6*d.* each.
In No. 38 of the "North British Journal of Horticulture," it is described thus: "On standards its fruit attains the full size of a Green-gage so grown. In form it is more obovate, in colour more yellow, beautifully marbled with reddish-brown spots, the side most exposed to the sun, clouded with purplish red, and covered with a rich bloom. Flesh yellowish; flavour high and luscious, adhering slightly to the stone, which is small for the size of the fruit. On walls it attains a larger size, but in no way improves in flavour, which we think is the case with all standard-grown fruits, and hence in this case the high merits of this variety, which as a dessert fruit is equal to the old Green-gage (the best Plum grown), and superior to it in being so much hardier."

AMBROSE'S SEEDLING FANCY PELARGONIUMS.—To be sent out the middle of October, for prepayment only, the first remittance to secure the first selection. Post-office orders are requested to be made payable at Chelsea.
GAIETY.—A small, distinct, and pleasing variety, top petals rich mulberry, with a pink margin, lower petals spotted with the same, a close grower, and very free, the leading fancy flower of the season. 21*s.*
BELLE MARIE.—A fine, distinct flower, smooth, and of fine substance, top petals rich mulberry, margined with crimson, lower petals with the same; constant and free; the only fancy Geranium that obtained a certificate at the Royal Botanic Exhibition of 1848. 21*s.*
NE PLUS ULTRA.—A great novelty, top petals deep crimson, shaded with purple; lower petals much the same colour, having a delicate margin of pale pink, a well-defined white throat, very distinct, the truss having very much the appearance of an Auricula flower; a close grower, and very free. 21*s.*
PERFECTION.—Top petals bright rose, margined with white; lower petals spotted with rosy lilac; free bloomer, constant, and excellent habit. 10*s.* 6*d.*
DELIGHT.—Ground colour blush, top petals having a beautiful pink blotch, and prettily pencilled with rose; fine habit, and free bloomer. 7*s* 6*d.*
PILOT.—Ground colour white; top petals blotched with mulberry, lower petals having a spot of the same colour on each; fine dwarf habit, and very free. 10*s.* 6*d.*
W. A., having a few packets of Fancy Geranium Seed to dispose of, begs to offer the same at 2*s.* 6*d.* per packet of 40 seeds.
Battersea, Oct. 12.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.
Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Oct. 12.

NEW FANCY GERANIUMS AND CINERARIAS.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, will commence sending out on the 20th inst. the following new FANCY GERANIUMS, at 10*s.* 6*d.* each; for description see *Gardeners' Chronicle* of last week:

BLACK PRINCE.	PRIMA DONNA.
EXQUISITE.	PRINCE ALBERT.
MARION.	REINES DES FLEURS.

Also, in November, his new CINERARIAS, a description of which will be given in the *Gardeners' Chronicle* of next week.

NEW SEEDLING PANSIES—"COMMANDER-IN-CHIEF" AND "PRINCE ARTHUR."

YOUELL AND CO. beg to announce they are now prepared to execute orders for the above first-rate PANSIES, which they guarantee will give the highest satisfaction.
"COMMANDER-IN-CHIEF" was exhibited at the Worton Cottage Meeting of May 29th, under the initials of "T. T.," and the following opinion is given in "Beck's Florist" of July last: "No. 2, Yellow ground, bronzy purple top petals, lower ones margined with the same colour, bold eye, showing to great advantage: *a fine flower for Exhibition.*"
The following opinion of this fine flower is also given in the *Gardeners' Chronicle*, of June 20th, under the initials of "Y. Y." "No 2, Rich yellow ground, top petals dark maroon, lower petals margined with the same colour—eye good; a full-sized and fine flower."
"PRINCE ARTHUR," white ground, top petals rich dark purple, lower ones margined with the same colour, eye good—flowers large and of great substance.
This was exhibited with "Commander-in-Chief" at the Worton Cottage Meeting, and obtained the following opinion: "No 38, Style of Optimus, and a considerable improvement upon it, having more ground colour."
Strong plants of the above 5*s.* each per post free if required; and one over to the Trade when three are ordered.

THE FINEST CARNATIONS, PICOTEES, AND PINKS.

YOUELL AND CO.'S Extensive and Celebrated Collection of the above are this season unusually strong and healthy, and are ready for sending out, in fine well-rooted plants, to any part of the United Kingdom, or for exportation, at the following prices:

25 pairs of finest first-rate show varieties of Carnations and Picotees	£5 0 0
12 pairs do. do. do.	2 10 0
25 pairs of very fine show varieties of do. do.	3 0 0
12 do. do. do. do. do.	1*l.* 4*s.* to 1 10 0
Fine mixed border ditto—per dozen pairs	0 12 0
True or Clove—per pair	0 2 0

PINKS, finest first-class show flowers, 12*s.* to 18*s.* per dozen pairs.
PANSIES, the finest first-class show flowers, comprising all those exhibited in the winning stands at the Metropolitan Exhibitions, 10*s.* to 18*s.* per dozen, per post free.
CAMELLIAS of the newest and best kinds, with flower buds, 30*s.* per dozen.
CINERARIAS, do. do., 12*s.* to 18*s.* per dozen.
ERICAS, of the best autumn, winter, and spring-flowering kinds, 6*s.* to 9*s.* per dozen.
EPACRIS, ditto ditto, 9*s.* to 12*s.* per dozen.
CORRÆA speciosa major, Cooperii, bicolor, &c., in fine bushy plants, for winter flowering, 12*s.* per dozen.
MITRARIA COCCINEA, a splendid hardy shrub, with large scarlet flowers, fine bushy plants, 18*s.* per dozen.
ROSES, Standards, Half Standards, and Dwarfs, of the finest kinds in cultivation, 12*s.* to 15*s.* per dozen,
TRUE FASTOLFF RASPBERRY, as originally sent out by YOUELL and Co., 15*s.* per 100.
Royal Nursery, Great Yarmouth, Oct. 12.

HYACINTHS AND OTHER ROOTS.

RENDLE'S NEW PRICED CATALOGUE OF BULBOUS ROOTS

Is just published, and can be had on application, gratis. It contains a DESCRIPTIVE *List of all the best Hyacinths, Tulips, Iris, Ranunculus, Anemones, Crocus, Liliums, Gladiolus, Ixia, &c., with some excellent* CULTURAL ADVICE *as to the best method of growing them. It will be found of great service to all growers.*
The "Collections of Seeds" sent out by us having given such universal satisfaction, we have been induced to offer the following "Collections of Roots," which we are certain will please every purchaser.
For the List of Roots contained in the Collections, see our new Book Catalogue.

COLLECTIONS OF BULBS.	£	*s.*	*d.*
No. 1 Collection, all the most approved sorts ...	3	0	0
No. 2 Collection, containing smaller quantities ...	2	0	0
No. 3 Collection, for a small Garden	1	0	0

For details of Collections, see Catalogue.

100 Hyacinths in 100 very fine sorts. Purchaser's selection	3	0	0
100 Hyacinths in 50 fine sorts. Purchaser's selection	2	10	0
50 Hyacinths in 50 superior sorts ditto ...	1	10	0
50 Hyacinths in 25 superior sorts ditto ...	1	5	0
24 Hyacinths in 12 superior varieties ditto ...	0	12	0
12 Hyacinths in 12 superior varieties ditto ...	0	6	0

Where the selection of Hyacinths is left to W. E. R. and Co., they request to be informed whether they are intended for water, pots, or the open ground; also whether single or double Hyacinths are preferred. When the choice is left to them they generally send about two-thirds double, and one-third single, which gives a greater variety. Purchasers may rely upon really good sorts being selected when the choice is left to ourselves, and we will guarantee to give them satisfaction.
For Catalogues, and further information, apply to
WILLIAM E. RENDLE AND Co.,
Seed Merchants, Plymouth.
N.B. Our Hyacinths and other roots have just arrived from Holland in excellent condition.

TESTIMONIAL TO MR. MUNRO, late Gardener to the Horticultural Society of London.—At a Preliminary Meeting, held at the Roebuck Inn, Turnham Green, September 30th, 1850; Mr. Glendinning, Mr. Thompson, Mr. Cock, Mr. Edmonds, Mr. Gordon, Mr. Caie, Mr. Ayres, and Mr. Ivison being present, Mr. GLENDINNING was called to preside. Mr. Caie was then elected Secretary, and Mr. Edmonds Treasurer.
It was then Resolved, That a subscription not exceeding Half-a-crown for each person should be entered into for the purpose of presenting Mr. MUNRO with a suitable Testimonial of esteem, on his retiring from the superintendence of the Horticultural Society's Garden, which appointment he held for upwards of Thirty years.
Persons desirous of contributing are requested to forward their subscriptions to the Treasurer, Mr. Charles Edmonds, Chiswick House, Chiswick, Middlesex.
It was also Resolved, That the Subscription List be closed on Saturday, November 16th, 1850.
*** Post office orders payable at Turnham Green.

BECK'S PELARGONIUMS.—The TWO GUINEA COLLECTIONS of Twelve Plants have amongst them RUBY, SARAH, and DORCAS, seedlings not sent out before, but frequently exhibited in our winning collection, may be had in exchange for a post-office order on Brentford, in favour of JOHN DOBSON; package and carriage to London included. They are in 3-inch pots, and wanting an immediate shifting. Catalogues may be had on prepaid application, enclosing one postage stamp.—Worton Cottage, Isleworth.

HERTFORD ROSE NURSERIES.

J. T., wishing to clear his ground of some of his large stock of Trees and Shrubs for other purposes, feels confident greater bargains cannot be made elsewhere.

When large orders are given liberal allowance will be made. Remittances are requested from unknown correspondents, to be made payable to J. TURRELL, Providence Nursery, Ramsgate.

LARGE SURPLUS STOCK OF FOREST TREES, SHRUBS, &c., NOW ON SALE AT RENDLE'S NURSERY, PLYMOUTH. ESTABLISHED 1788.

WILLIAM E. RENDLE AND CO., PLYMOUTH, *have a large SURPLUS STOCK of the following TREES and SHRUBS; and as the ground is required for other purposes, they will be sold at the following low prices:*

*** CARRIAGE FREE (See below.)

THORNS OR QUICK.—10,000 fine transplanted Thorns, from 12 to 15 inches high, for 3*l.* 10,000 one-year old Seedlings, at 1*s.* 6*d.* per 1000.

LARCH FIRS.—We have a very large stock of fine stuff, about 3 feet in height; the price will only be 18*s.* per 1000 if 5000 are taken.

TURKEY OAKS.—Fine, handsome, well-selected trees, well transplanted. 80*s.* per 1000, worth at least 20*s.* per 100.

BERBERIS AQUIFOLIA.—A large quantity of fine stuff, 18 inches, 16*s.* per 100. This is a fine Shrub for underwood.

SCOTCH FIR.—Large stock of fine stuff, 24 to 30 inches in height, 18*s.* per 1000, if 5000 are taken.

PINUS AUSTRIACA.—We have an extensive stock of this valuable tree, of the finest possible growth, 12 to 18 inches, fine and novel, 35*s* per 1000.

RHUBARB: MITCHELL'S ROYAL ALBERT, *the earliest of all.* — We have more than a thousand strong roots, 15*s.* per dozen. *These will produce abundantly next Spring,* if planted now.

RHUBARB: MYATT'S VICTORIA, very strong roots, 15*s.* per dozen; smaller ditto, 9*s.* per dozen. YOUELL'S TOBOLSK, 3*s.* per dozen.

RASPBERRIES: RENDLE'S LARGE BEEHIVE.—This is a large handsome variety, very prolific, delicious flavour, and has given the most complete satisfaction to all. Strong Canes, 20*s.* per 100; 3*s.* per dozen.

YOUELL'S FASTOLFF, 10*s.* per 100.

STRAWBERRIES: KITLEY'S GOLIAH, 3*s.* 6*d.* per dozen; 20*s.* per 100. CUTHILL'S BLACK PRINCE, 2*s.* per dozen; 10*s.* per 100. *All the following excellent sorts at* 3*s.* 6*d.* per 100: Myatt's Eliza, Mammoth, British Queen, Globe, Prolific, Victoria, Cooper's Seedling, Elton, Keens' Seedling, Cole's Prolific, Deptford Pine, and Roseberry.

SEAKALE AND ASPARAGUS in large quantities, very reasonable.

BEST DOUBLE RUSSIAN MATS, 5*l.* per 100.

BLACK NAPLES CURRANTS, very superior to the old sort, 6*s.* per doz.

GOOSEBERRIES.—Some of the best known, 30*s.* per 100.

ARBUTUS.—Fine plants in pots, 12 to 18 inches, 5*s.* per dozen.

ILEX OAK.—Fine plants, *in pots*, 18 to 24 inches, 5*s.* per dozen, worth 10*s.* per dozen.

CEDRUS DEODARA.—Fine stock of nice young seedling plants, two years old, in pots, 6*s.* per dozen.

Our Autumnal Catalogue of Forest Trees, Shrubs, and Fruit Trees can be obtained for one penny stamp.

All orders above 5*l.* will be delivered CARRIAGE FREE to any Station on the Great Western, Bristol and Exeter, or South Devon Railways; or to Cork, Dublin, or Belfast. Steamers from this port to Cork, Dublin, and Belfast twice a week.

The South Devon Railway is now open to Plymouth; the station being within one minute's walk from our Counting-house.

FIRST ORDERS WILL HAVE THE PREFERENCE. ALL ORDERS WILL BE EXECUTED IN STRICT ROTATION.

WILLIAM E. RENDLE and Co., Nurserymen, Plymouth.
Established 1786.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

NEW ROSE CATALOGUE.

WM. WOOD AND SON have the pleasure of announcing that their DESCRIPTIVE CATALOGUE for the ensuing season is now ready. In addition to the splendid collection enumerated in former Catalogues, the present edition contains many varieties of first-rate merit.

As heretofore, the Catalogue will be duly forwarded to all who have favoured W. W. and S. with their commands, and may be had Gratis on application; also Catalogues of Ornamental Trees and Shrubs, Coniferæ, American, Herbaceous, and Greenhouse Plants; and Descriptive Catalogues of New and Choice Fruit-trees, new Verbenas, Fuchsias, Cinerarias, &c. &c. The Trade Catalogue is also now ready.

Woodlands Nursery, Marshfield, Uckfield, Sussex.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 5*s.* per 100.

Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s.* 6*d.* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 2*s.* per 100.—Manor Farm, Deptford.

FIRST CLASS SEEDLING PANSIES.

JAMES NEILSON, AUCTIONEER and FLORIST, Falkirk, begs respectfully to intimate to the lovers of the PANSY, that he will send out his celebrated Seedling Pansies by the end of October, viz., JEROME, NORAH, and BOULANGER. The following is a description of the Flowers:—

JEROME has a creamy-white ground colour, beautifully laced with a light blue lilac-purple on the three under petals, with upper petals the same as the lacing, and a striking large bold dark centre; form and substance first-rate, and was awarded the First Class Certificate by the Scottish Pansy Society.

NORAH has a pure white ground, most superbly laced with blue purple, fine dark centre, edges smooth, and form perfect, and is most decidedly the thickest Pansy with a white ground in cultivation; and can never be much improved upon, as it is the perfection of the Pansy.

BOULANGER has a golden yellow ground of the richest colour imaginable, and laced with a brown purple; has a large conspicuous dark centre, with edges smooth and form perfect; and, if the expression may be used, with substance thick as leather.

The above three flowers will be an acquisition to any collection whatever; indeed, as much so as "Magnificent" was when sent out by J. N., and is still to this day.

Plants of the above will be sent post free to any part of the United Kingdom at 5*s.* each, with the usual discount to the trade only, when more than three plants are taken. "Boulanger" will not be sent out till Spring. Remittances from unknown correspondents payable at the Post-office, Falkirk.

Falkirk, Oct. 12,

RHODODENDRON CINNAMOMUM var. CUNNINGHAMI.

MESSRS. GEORGE CUNNINGHAM AND SON are now prepared to send out plants of the above-named splendid RHODODENDRON. It is figured in the August Number of "Paxton's Flower-Garden; by John Lindley and Joseph Paxton." And for a description of its merits and origin, the advertisers refer the public to that periodical. The price is 21*s.* each, with the usual discount to the trade.

Oak Vale Nursery, Liverpool, Oct. 12.

HUNTINGDON NURSERIES.

MRS. WOOD, in returning her sincere thanks for the kind patronage she has received in the Nursery, Seed, and Flower Trades, begs to announce that she has retired from the same, in favour of her Nephew, Mr. JOHN INGRAM, by whom for some years past the Business has been superintended, and for whom she earnestly solicits a continuance of that support which for upwards of a century has been accorded to her late husband's family. All debts owing to and from Mrs. WOOD will be received and paid at the Nurseries, Huntingdon; and it is respectfully requested that all post-office orders be made payable to SUSAN WOOD.

JOHN INGRAM, in succeeding to the above business, most respectfully informs the planting and horticultural public, that nothing shall be wanting on his part to merit a continuance of the favours for so many years liberally bestowed on his predecessors. The stock comprises an immense quantity of Fruit, Forest, and Ornamental Trees, Evergreens, Roses, &c., as well as a large collection of Stove, Greenhouse, and Bedding Plants, with every description of Florists' Flowers, of all of which Catalogues may be had on application. Seeds for the supply of the Kitchen and Flower Gardens are grown on the premises, the detached character of these Nurseries affording excellent facilities for keeping the varieties pure and distinct.

A few stocks, containing fine dormant buds, of the STANWICK NECTARINE to be sold at 21*s.* each. Very fine well-rooted SPRUCE FIRS, 2 to 3 feet, 30*s.*; 3 to 4 feet, 35*s.* per 1000.

Huntingdon is situated on the main trunk of the Great Northern Railway, which will afford a cheap and rapid transit both north and south.

N.B. The business will in future be carried on under the firm of "WOOD and INGRAM."

TO NURSERYMEN AND FLORISTS.

SHEPHERD'S "PRIORY QUEEN," a SEEDLING GERANIUM raised from Luceum roseum: colour much brighter, with compact circular truss of flowers, very dwarf habit small foliage, and a very free bloomer.

See an abstract from Beck's "Florist," for September:—"*W S, Kew.* Seedlings from Luceum roseum. Of your two varieties the one with compact circular truss is a very pretty thing, and if a free bloomer will be valuable for bedding purposes." Any Nurseryman or Florist wishing to possess the Stock can see the same in bloom, and will be liberally treated with, by applying to WM. SHEPHERD, Gardener, Priory, Kew, Surrey.

SEED TRADE.—Seeds of every description, and of the best quality, can be had at J. G. WAITE'S SEED ESTABLISHMENT, 181, High Holborn, London, at 20 per cent. lower than any other House in the Kingdom.

POTATO ONIONS, fine sound Bulbs, 14*s.* per cwt.—Oct. 12.

NEW EARLY FORCING BEAN.

J. G. WAITE begs to inform Market Gardeners, and the Public generally, that he can supply any quantity of the TRUE SION HOUSE DWARF FRENCH BEAN at 24*s* per bushel. It is well known as the earliest and most prolific in cultivation.—181, High Holborn, Oct. 12.

LONDON PARTICULAR LONG SCARLET RADISH has now been proved to be the earliest and best in cultivation, 500 bushels having been sent out last season, and given the greatest satisfaction. Any quantity, warranted to grow 95 per 100 seeds, can be had at 25*s.* per bushel, on application to J. G. WAITE, 181, High Holborn, London.—Oct. 12.

RHUBARB ROOTS.
MITCHELL'S ROYAL ALBERT, 70*s.* per 100.
MYATT'S LINNEUS, 70*s.* per 100.
MYATT'S VICTORIA, 48*s.* per 100.
J. G. WAITE, 181, High Holborn, London.—Oct. 12.

DUTCH BULBS.

CLARKE AND Co., SEEDSMEN and FLORISTS, 86, High-street, Borough of Southwark, London, beg to inform the Public that they have received a second Importation of genuine DUTCH BULBS this week, ex Earl of Auckland, from Rotterdam, which will enable them to supply a Choice Assortment of all kinds of Roots.

CLARKE and Co. will be happy to forward their Descriptive Catalogue, free, upon application.—The Trade supplied.

TO BE SOLD, TWO ALDERNEY COWS and Forty SOUTHDOWN EWES, in Lamb, Forty STOCK LAMBS, and One Hundred WELCH WETHERS.—To be seen at Mr. M'LAREN'S, 10, Grove Vale, near Peckham-rye, Surrey.

MESSRS. J. AND H. BROWN inform the nobility and gentry they supply large or small quantities of fine Evergreens, Ornamental Shrubs, Superior Fruit Trees, &c., to furnish New Walls, Gardens, and Pleasure Grounds. Also Choice Plants for New Conservatories, &c. Packages forwarded to any part of the United Kingdom or the Continent.

12 Orchidaceous Plants, choice species, and good plants	30	0
12 Newest Chrysanthemums, distinct varieties ...	8	0
12 New Dwarf Liliputian Chrysanthemums, ditto ...	10	0
Fine New Yellow Picotees and Carnations of best show sorts, with names, per pair	2	6
Pinks, very best show sorts, by name, per dozen pair	12	0
Violets: Arborea, Russian, and Neapolitan, per doz.	4	0
Cinerarias, new choice varieties, per dozen, 6s. and	9	0
Fancy and other Geraniums, best sorts, per dozen ...	9	0
Passifloras, Jasminums, and Clematis, of sorts, each	1	6
Cryptomeria japonica and 6 choice Pinus, for ...	10	0
Hyacinths, Crocus, Tulips, Lilies, and all kinds of Dutch roots for forcing, &c.		

Albion Nursery, Stoke Newington, London, Oct. 12.

CUTHILL'S BLACK PRINCE STRAWBERRY, Now sending out, price 10s. per 100.

Also, PRACTICAL INSTRUCTIONS FOR THE CULTIVATION OF THE POTATO, containing the Competition Essay for the Prize of 100 francs, offered by the Belgian Government.

Also, Instructions on the Management of Asparagus, Seakale, Rhubarb, Vegetable Marrow, Scarlet Runner, Strawberry, Melon, Cucumber, Chicory and Lamb Lettuce as Salads; the Lisianthus Russellianus, the Tree Mignonette, the Destruction of Woodlice and Green fly; and Peat Charcoal as Manure.

By JAMES CUTHILL, Horticulturist, Camberwell.

London: Printed for the Author, and sold by him, price 2s., or by post 2s. 6d. Sold also at Hamiltons and Co., 33, Paternoster-row.

A Lad about 17 years of age wanted.

KNIGHT AND PERRY, Exotic Nursery, King's-road, Chelsea, respectfully invite an inspection of their fine healthy stock of PEACH, NECTARINE, and other FRUIT TREES (free from insect, and of all the best kinds, both trained and untrained), which cannot fail to afford complete satisfaction wherever supplied, as they combine the advantage of the most elaborate attention to their culture, both in root and branch, with a particular method of labelling, ensuring the accuracy of each kind; their stock of VINES, raised from eyes obtained from the fruiting plants of the most eminent growers in the country, is larger than ordinary, and of first-rate excellence.—Exotic Nursery, King's-road, Chelsea.

TRUE DOUBLE ROMAN NARCISSUS, 3s. per dozen.
THE MOST FRAGANT AND EARLIEST FLOWERING OF ALL THE NARCISSUS.

ROBERT HALL begs to advise the arrival of his Annual Importation of the above-named BULBS, in fine healthy condition. Also, fine Dutch HYACINTHS 6s. per dozen, or 3 dozen for 15s. Crocus, Jonquils, Tulips, &c., at his Foreign Warehouse, 63, South Audley-street, Grosvenor-square, facing the Chapel.

Priced Catalogues may be had by post, and postage stamps taken in payment.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6s. per dozen; smaller ditto, 3s. per dozen; or 1l. per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2s 6d. each; or smaller ditto, 1s 6d. each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3s. per dozen.

True BATH COS LETTUCE SEED, 1s. per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1s per packet.

ANTIRRHINUM SEED from all the best varieties, 1s. per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2s. 6d. per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

ROSE CATALOGUE.

H. LANE AND SON, Great Berkhamstead, Herts, will send their New CATALOGUE to all their old customers free, and new applicants may have it by enclosing two penny stamps. Those who are about planting Pleasure Grounds, &c., should inspect H. L. and Son's Nurseries (about 50 acres), as they have a fine healthy stock of some thousands of Cedrus Deodara, 2 to 4 feet; Araucarias, 2 to 3 feet; Abies Douglasi, from seed, 4 to 5 feet; with all the leading Pinus. Rhododendrons, all the hardy varieties from white to crimson, growing in loam, from which they remove readily; also the hybrids of Sinensis, greenhouse varieties; Azaleas, best Ghent; with a general collection of Trees and Shrubs, both for the Pleasure Ground and Park; also of Fruits, Catalogues of which may be obtained by enclosing two penny stamps. The stock of Plants at these Nurseries is kept constantly removed, to ensure success, and not drawn up to be sold at a price to deceive the public. Double Camellias, and Greenhouse Azaleas, 1 to 4 feet—prices given on application.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WM. WOOD AND SON having with much care made a choice Selection of the best CINERARIAS from those sent out during the last two seasons, and having a fine stock of healthy plants, that will bloom well during the ensuing winter and spring, beg to offer them on the following terms, viz.:

12 very superb new varieties	18s.	0d.
24 ditto ditto	30	0
12 new Fuchsias of 1850	18	0
12 new Verbenas of 1850	15	0
24 ditto ditto	25	0
12 new Petunias of 1850	18	0
Superior mixed double Hollyhocks, per dozen ...	6	0
Superb named ditto, per dozen	18	0

NEW SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER has been Purchased by the following Nurserymen:—Messrs. Henderson and Co., Pine-apple-place; Messrs. E. G. Henderson and Co., St. John's Wood; Mr. Charles Turner, Royal Nursery, Slough; Messrs. Bass and Brown, Sudbury; Mr. Keynes, Salisbury; Mr. W. Cock, Chiswick; Mr. B. N. Cant, Colchester; Mr. W. Bragg, Slough; Mr. Wm. Ivery, Peckham, Surrey; and most of the other leading Nurserymen in the kingdom.

Strong Plants now sending out, 20s. each, one-third off to the trade, with one added to every three.

Apply to WILLIAM E. RENDLE & Co.,
NURSERYMEN, PLYMOUTH.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 12, 1850.

FOR some years past VINES have been seriously attacked by a kind of MILDEW, which in many instances has ruined the crop, and in others has almost destroyed the plants themselves. In our vol. of 1847, p. 779, the Rev. Mr. BERKELEY pointed out the true nature of this affection, showing that it was caused by the presence of a minute parasitic fungus which he described and figured under the name of *Oidium Tuckeri*. He also suggested the application of sulphur as a means of stopping the ravages of this mildew. Little attention, however, seems to have been paid to the hint; for in 1848 the mischief was greater than ever. But on the 22d July of that year Mr. KYLE, an intelligent gardener at Leyton, announced (p. 493), that he had stopped the evil by the application of sulphur and water.

From that time to the present no certain opinion seems to have been formed concerning the value of this application. We have always recommended it, asserting that if it is employed early enough to check the mildew, a cure would be effected. Those who have tried it do not agree as to the result. Some find it effectual; others derive no benefit from it. The French, who have been sufferers like ourselves, evidently know nothing of the remedy (see p. 613), and are even now hunting for a mode of cure. Others, on the contrary, report the total disappearance of the mildew under a persevering application of sulphur: and no doubt remains that with skill and attention this Grape disease has ceased to be formidable. What the causes of failure may have been, it rests with those who have failed to discover. We can only announce the fact that sulphur is an undoubted cure; for what succeeds in Hammersmith must succeed at Thoméry.

In confirmation of this statement we now lay before our readers the following letter from Messrs. LEE and Co., of the Nursery, Hammersmith, dated October 4, 1850.

"We beg your acceptance of a few Grapes of our growing, as an instance of the triumph of sulphur over mildew. When the Grapes were as large as Peas the house was struck from end to end with mildew, scarcely a bunch being without one or two berries affected, which no doubt would have spread to every berry, if not taken in time. We immediately commenced throwing powdered sulphur over every bunch, all over the leaves and wood, and continued this practice daily for several weeks. The sulphur was not washed off till the Grapes were half coloured and yet the bloom is uninjured. No fire was lighted in the house and no other means employed except once syringing the berries with sulphured water. This is the second instance that has come under our personal observation this summer in which mildew has been completely stopped by the application of sulphur without even the aid of a fire, and this in a cold damp season."

The Grapes here referred to were as well swelled, as well coloured, as well ripened, as handsomely covered with bloom as the best Grapes to be found where the mildew is unknown. In fact, in the absence of the statement made by Messrs. LEE, no one could have imagined that they had been mildewed at all.

And now arises the important enquiry whether sulphur will not destroy all other kinds of mildew. That of the Peach, of the Rose, of the Hop, Pea, and Onion, are all very closely related to each other; all possess the same habits, and are formed from tissue which is apparently the same in the one as in the other. We are informed that evidence exists of a cure for the Hop mildew having been undoubtedly found in flowers of sulphur driven repeatedly among the leaves; and we have now before us the registered design of an ingenious instrument contrived by Mr. EPPS, of Maidstone, for the express purpose of throwing clouds of sulphur among the leaves into the air of Hop fields.

The machine in question in some respects resembles FRY'S, mentioned at p. 501 of the present volume; but is really a powerful instrument, as well as being constructed upon a better principle. It consists of a fan-blower, worked by a wheel, and driving air rapidly through a passage in the casing of the fan. Above this passage is placed a hopper, containing the sulphur to be projected. Below the hopper, and between it and the air passage, is a box containing a sieve or perforated plate, and connected with the hopper by a flexible tube. This box receives the sulphur from the hopper, and conveys it to the air passage through which the fan-blower is to drive it. The oscillating horizontal motion requisite to ensure the constant action of the sieve is obtained by a lever and cam, which are set in action by the rotatory motion of the wheels that work the fan-blower. This last part of the contrivance is of great importance, because it ensures uniformity of delivery to the sulphur, preventing all choking up and sticking together of the particles.

Having seen this instrument in action, we can only add that it appears to us to be by far the best of the mechanical inventions for throwing into the air sulphur or other substances in a state of minute division.

A CORRESPONDENT has sent us an example of the Sweet William, in a peculiar state. It appears to have been in that condition during the whole summer, without producing flowers. Our correspondent suggests that it may be an instance of a moss growing on the top of the stem, where the flowers should be. As others may be equally puzzled by the peculiarity, it seems desirable to explain fully its real nature.

The following cut represents the appearance of three of the branches of the part where flowers should have grown; and the amputated portions indicate

where other branches of like nature once grew. They occupy exactly the place of flowers. Each consisted of a large number of small, pale-green, spreading, narrow, sharp-pointed leaves, placed over a slender twig; and the tuft, viewed as a whole, certainly bore a striking resemblance to a bunch of some kind of Hair-moss (*Polytrichum*). It is, however, manifest, that the appearance is produced by the conversion of the flowers into branches, and that the case is merely a striking one of "proliferousness."

A flower consists of certain parts called bracts, sepals, petals, stamens, carpels, placed one within the other, in the order in which they are here enumerated, and arranged round a common centre. In the beginning they are all alike, and in no respect distinguishable from leaves. As the formation of a flower advances, these tiny leaves, obedient to the vital force resident in that part of the plant, assume the condition of bracts, sepals, petals, stamens, and carpels, each having its peculiar form, and its allotted

office to perform in the economy of the plant. But if anything disturbs the operation of that vital force which is necessary for the formation of a flower, then, in that case, the tiny leaves, no longer subject to the floral influences, all extend into leaves; and, at the same time, the centre, which in the flower is a fixed point, acquires full power of extension, clothes itself with other leaves, and advances into the condition of a leafy twig.

Such cases as this can be explained in no other way; thus interpreted, their history becomes intelligible, and they prove to a demonstration that a flower is really nothing more than an ill-developed branch, clothed with leaves, in a peculiar condition. On such cases rests the doctrine of morphology, so important to the gardener, as the key to numerous phænomena, which essentially affect the success of his operations.

HOW TO MISMANAGE A GARDEN.

Chapter X.—If you have a greenhouse to keep, or a stove, or any such place, especially a greenhouse, great opportunities will occur of managing badly. Glass houses are sure to tell the observer, at the end of a winter, what amount of talent of that sort is at the command of the gardener, or of the amateur who has no gardener.

The principal points to attend to by him who wishes to spoil his plants, may be classed under the two heads of heating and airing; and, in the first place, of heating.

Never light your fire till the last minute in the day; put off and dawdle as long as you can; then, when the cold begins to be sharp, make up a rousing fire, and get the heat up as quickly as possible. By this means you may accomplish three things of importance in mismanagement; you are sure to waste half your fuel, you may crack the flue, and you must keep your plants growing at night, which is the wrong time. By these simple means you encourage the coal merchant, find a job for the bricklayer, and make a mess of your plants. If the flue is cracked and the bricklayer is not to be found, the smoke will make its way into the house; this will give you an opportunity of opening the sashes, to let the smoke out again, and of cooling down the house by bringing in cold air—a method particularly advantageous at Christmas time. These little inconveniences are obviated by lighting the fire early, and getting the heat up slowly; but that is only good management, of which you are not in search.

When you put fuel into the fire-place, pitch it in as far as you can get it to go; in that way you will be certain some day to have the satisfaction of blowing up your flue—an interesting philosophical experiment which will enable you to understand the effect of uniting gases, so as to produce an explosive mixture. If you bank up your fuel close to the door of the fire-place, this cannot happen; the fire will burn better, and there will be less waste; but that again is good management, which is to be avoided.

Never cause your flues to be cleaned from soot till the plants are brought into the house for the winter. You can then try whether the flues will draw; perhaps they will. and then you need not have them cleaned till they catch fire, and burn the house down; perhaps they will not, and then you can have the job done as well as at any other time. As to the dust and soot dirtying your plants, why, you can wash them again, and very likely they will look as well as ever.

Never consider with how little fire plants may be preserved; that would be good management. On the contrary, keep the heat up well, most of all at night; in that way you are sure to have tender, pale-green leaves and shoots, with pale flowers, and not many of them. It is surprising how delicate and interesting a collection of greenhouse plants may be made by such means. As to resting your plants, never think of the thing; what is the use of plants at rest? they might as well be dead. Keep them always growing, and fastest in the autumn. In that way you may depend upon bringing them into the worst possible state in the shortest possible time.

Never give air in winter; plants managed as is here suggested cannot bear it. Shut the houses up close, and keep your fire going. Why should plants have air? If that is what they want they might as well be out of doors, where they will have plenty of it. As for their breathing, and in that way spoiling the air about them, as animals do, who ever saw a plant breathe? If it did breathe we must see it. We do not see it; therefore it does not breathe.

When you water your greenhouse plants in winter, take it cold from the pump, or the tank outside, and dash it over them. As they cannot feel, the coldness cannot hurt them; and it saves the trouble of warming the water. An amateur has been known to spoil his whole crop of early Grapes and forced Strawberries in this manner; and it cannot be denied that that is as good an example of mismanagement as could be desired.

Instructions like these are too valuable to be mixed with others of a different nature, and therefore I pause, in order to give you a week's time to think them over, and see how they can be made to suit your case. Κῆπουρος.

GARDENING IN HOLLAND.—No. IV.

Leyden has a character and appearance more stayed and sedate than either Rotterdam or Amsterdam. It is not without business, but is not all bustle; one here feels that man has time for reflection, and that life has other attractions than mere money getting. I have an affection even for the descendants of those citizens who could perceive the difference between being remitted for a few years from civic taxation and being permitted to found an University within their walls—a difference between present gains and future greatness—the difference between self-aggrandisement and a noble looking forward for their city's and their country's elevation in the scale of nations. With the long line of eminent men, who, being nurtured here, have shed a halo over literature, art, and the sciences, we have nothing to do with here; but it is quite in keeping with my design to treat of the results, as shown in the museums and botanic gardens which they have left us. I strolled into the University, which seems adapted for its purposes without architectural embellishments. It is plain and utilitarian in its character; but the council-room, with its *veræ* effigies of upwards of a hundred of the professors who have aided in the advancement of knowledge for two centuries, could not be looked at without emotion. Here we see the men who have connected themselves with our own literature, as well as that of other nations, and Salmatius to an Englishman, who is proud of his Milton, will be gazed at with interest.

The learned Scaliger is there; and Boerhaave, who gave to medical science at once comprehensiveness and enlargement; these, with Brugmans and Van der Palem, arrest our attention and receive our homage. The Town Hall is well worthy a visit. The Herbarium, the Museum of Natural History, and that of Egyptian, Greek, and Roman Antiquities, as well as the Botanic Garden, are only a short distance from each other; and many a lover of all, like myself, must have been perplexed as to which object he should first pay his attention.

I went to the garden, and my only reget was the absence of the botanical Professor de Vriese from the town. I was, however, received by an intelligent gardener who had both the ability and will to assist me in my investigations. The gate open, I was in front of a noble group of Aloes and Agaves, one of the latter so large and so healthy that I wondered that it had not flowered years ago. My informant assured me that it would blow the next year, but I confess I saw no indications of the coming event. He told me however that two had flowered in that establishment during the time that he had worked there. The bust of the great Linnæus, and those of Dodonæus, of Clusius, and of Brugmans, adorned this part of the gardens, and seemed most appropriately and specially to belong to it. A group of recently introduced Conifers has been planted within the last three or four years, but their situation is not well chosen, for they must inevitably do injury to the houses, so soon as they acquire a tree-like character. The want of space also must account for so many good things being placed so closely together. This brought us to the range of houses, the largest of which contained a few of the trees of New Zealand, whose leaves were of singular forms, and their colour either dusky green or quite brown. I could but think that, with no other adjuncts, how difficult it would be to produce effective groups in park scenery. Here I was shown that physiological curiosity that has occasioned so many speculations and disquisitions — the three-tined fork that was discovered imbedded in the solid trunk of a tree. It has been so well sawn that the tool is still fixed at the cross-bar, and showing only part of the tines. I have seen a large stone wholly imbedded in the like manner. I suppose the imbedding to have taken place in each case in this manner. A tree having been cut down throws up numerous shoots, and when the period arrives for cutting down the underwood, two or three were left, which ultimately would form a single stem. Now, suppose a stone or a workman's tool to be left on the original stump, and the two or three secondary stems to grow on till they met, such implement, stone, or other object, would inevitably become imbedded, to be revealed only in an after time, when the timber was cut up. I minutely traced the annual augmentation of layers in the present case, and am convinced that the growth has proceeded from two centres only. The house devoted to Palms has some noble specimens, that are well cared for; and an occasional good plant of Fern assured me that they must have been selected from a larger collection. There I saw a plant in full blossom that is only now, a month later, colouring with me—the Vriesia splendens, whose scarlet bracts are most vivid, and whose foliage is regularly barred with deep brown marks. I think this plant will long assert its right to favour in our stoves.

Passing these, we arrived at a house occupied entirely with the smaller species of succulents; these were placed more thinly than we are accustomed to see them, and the pots were sunk in troughs containing earth. So placed, they were growing delightfully, and many o the sorts were producing leaves much larger than were to be obtained under ordinary culture. A frame heated with leaves and manure, contained the dwarf Cereus from Chili and Mexico; they also were plunged. Masses of grotesque looking carbonate of lime, some tufaceous, were employed to grow several sorts of succulents upon, and with very good effect. When these plants are put upon rockwork, as occasionally seen with us, they do not admit of removal (and consequently are not proper for a nursery); but in this manner I am convinced a good rockwork of succulents might be formed, and the masses might be removed for sale with little more trouble than if they had been grown in pots. I saw here but few sorts that I am not growing, and our set of these plants, thanks to his Grace of Bedford, is infinitely superior at Kew. If my memory serves me rightly, however, the larger specimens of Aloes and Agaves are finest here. They have a house well filled with Orchids; but somehow or other they do not appear in health, there is but little foliage and that not of a luxuriant character; they reminded me of those belonging to the King, at the Hague, for condition; but this collection was by far the most extensive. Returned to my own Orchids I see a vigour of growth that I nowhere saw in Holland; and I am convinced that we must look for the cause in their being too much coddled in that country. Some nice young Pitcher plants, and several forms of Anæctochilus, with their beautiful variation, had been recently added, as I understood, from England. *W. Masters, Exotic Nursery, Canterbury.*

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

On the Epidermal Appendages of the Genera Callitriche, Hippuris, Pinguicula, and Drosera, by Dr. Lankester, F.R.S.—Although it was frequently stated that aquatic plants had no epidermis, yet many of them were covered with a very perceptible distinct layer of cells, which Schleiden calls epiblema. In certain instances this external layer of cells seemed capable of developing appendicular organs, as was the case with plants growing in the air. The author had previously published a description of certain bodies, which occurred on the surface of the stem and leaves of Callitriche verna. These bodies were stellate in form, and consisted of several cells united to one which acted as the base, and attached the rest to the surface. Since that time he had observed the same bodies covering the surface of the stem of Hippuris vulgaris. They were composed of a larger number of cells in Hippuris, and the author had not detected them on the leaves. Finding them on Hippuris, and Callitriche, he had sought them on Myriophyllum, but had not succeeded in detecting them there. He had however detected similar bodies on the surface of the leaves of Pinguicula vulgaris. These had been previously described by Professor Dickie. In Pinguicula, the stellate bodies were found lying directly on the surface of the leaf, or elevated upon one, two, or more cells, so as to resemble clavate hairs. In Pinguicula they were quite distinct from the stomates, and this might be taken as an indication of the nature of these bodies, in Callitriche and Hippuris. The author had also observed bodies of a similar kind on the surface of the leaves, and on the so-called hairs of Drosera rotundifolia. It was an old observation alluded to by Meyen, and dwelt upon by Morren, that the hairs of Drosera contained spiral vessels. The author had traced these to the bundles of vessels which formed the veins of the leaf, and stated that we must regard the hairs of Drosera as segments of the leaf. He regarded as the true hairs of Drosera the stellate bodies above referred to.

A few Remarks on the Treatment and Flowering of a plant of Dracæna Draco, or Gum Dragon Tree, in the Botanic Garden of Trinity College, Dublin, by J. T. Mackay, LL.D., M.R.I.A., Director.—The Dracæna Draco, or Gum Dragon Tree, on a plant of which I beg to make a few observations, was raised by me in the College Botanic Garden, in 1810, along with several others, from seeds brought from Madeira. After it had been grown in a pot for 10 years, it was planted out in a bed of earth in a large stove or hothouse. About three years ago it became too tall for the house, and in order still to secure the plant for the collection, the following experiment, suggested by my intelligent chief assistant, Mr. Bain, was made by him. The stem, which was then about 15 inches in diameter, was, during six months, gradually cut across, 4 feet above the root, about an inch deep at a time, when a little hot lime was applied to the wound, to prevent bleeding. The root and lower portion of the stem were then removed as being useless, and the upper portion of the stem suspended immediately above the former station of the plant. In the course of eight months, during which time it was kept perfectly dry, it threw out several aerial roots from the edge of the stem where it had been cut. It was then lowered into its former position, and had the stem and roots sunk about 4 feet, in dry sandy mould. This was done a year and a half ago, and the plant, which is now in excellent health, has lately flowered; and is, I believe, the only one that has done so in Great Britain or Ireland. It is a Liliaceous plant, having numerous small flowers produced on racemes, composing the large panicle, which was 4 feet in length and 3 feet in diameter. A portion of the panicle, and two drawings of the plant, I now lay before the meeting. As the above experiment on

Dracæna Draco has succeeded so well, the author thought the same treatment would be well worth trying on Palms and other indigenous plants when they become too tall for the house. — Professor Balfour thought Dr. Mackay's experiment of importance, as it might lead to the saving of many valuable plants. He feared, however, that the plan would not be found to answer for all endogenous plants. He did not think we could save Palms in this way, or they should be very glad to save a fine Caryota, which, because it broke the windows of their Palm-house, they had condemned to a cruel death, by exposure to the open air.

On the species of Gossypium, and the effects of Climate in altering the character of Cotton, by Professor Royle, M.D.—The author entered into a detail of the conditions of soil and climate which produced a change in the character of the Cotton plant. He criticised the species which had been created by botanists, and proposed to reduce the number very considerably. —Professor Walker-Arnott quite agreed with Dr. Royle, on the propriety of reducing the number of species of the genus Gossypium. He believed also, that with care Cotton might be produced in India, as good as any which came from America.—Dr. Cleghorn said that his experience of the changes in plants produced by climates and soil, enabled him fully to confirm the observations of Dr. Royle.

ROSES.

I promised that during the present season I would notice those particular varieties which might fairly be called permanent ornaments to the British gardens; and, although I may not mention all that in many persons' estimation deserve that distinction, I shall flatter none; and, therefore, if I commit an error, it will be one of omission.

The exhibitions of Roses in the autumn are very likely to deceive many buyers, who see great beauty in the bunches put up at a show, because, however diversified and interesting they may appear when gathered and bunched, many of the most inviting are of bad habit, and do not look well on the tree; whereas my old favourite, Fellenburgh, would look poor beside the rich and double varieties we see in bunches. Those which I prize are of fine habit. I have found one of the very best in Madame Desprez, which is, I have no doubt, now in full bloom in every situation; a Rose exceedingly double, a free grower, with healthy bright foliage, and showing constantly a noble head well furnished with flowers of a delicate and rather pale colour. It is not, like some of the most beautiful, bare of bloom, showing here and there a splendid flower, on the end of a vigorous rambling shoot, and for a long period bare altogether; nor is it, like others, equally beautiful in a bunch, but hanging on weak footstalks, as if they were blighted when on the plant. Next to Madame Desprez, and forming a fine contrast for colour, I have Pourpre parfait, in some gardens called Pourpre farfait, which I take to be a mistake. This is a rich double Rose, an abundant bloomer, deep purple crimson, and, like the others I have mentioned, forming a fine head, well furnished with blooms; and next to them I have Noisette Jaune Desprez, with flowers at the end of every shoot; and though not so gay as many others, making a very good variety; and Amie Vibert, literally covered with its snow-white flowers.

Now, here I have white, pale rose, crimson, purple, and yellow white, all richly flowering the whole season, and at this time so striking that, although I have a hundred varieties, many of them highly esteemed, I could honestly wish them to be changed, that I might see these five repeated all through the garden. I have straggling flowers on Mrs. Bosanquet, Miss Elliot, Madame Laffay, and 20 others; but they form no feature, and do not assist the garden, however well they may have appeared at one period for a short time; therefore, with all these claims, and they have many, they do not, like the others, enliven the scene for months together. I wish, therefore, to call the attention of all those amateurs who delight in Roses to the state of these collections now, and to beg them to take a walk round their gardens for the purpose of contrasting those with little or no flower with such as are covered with bloom, and to ask themselves whether any amount of beauty for a month compensates for the barrenness the rest of the year. I shall follow up this subject, and by way of finishing my remarks on Roses and Rose gardens, will give a list of those which come nearest to my notions of continuous bloomers; for although I have been furnished by very competent persons with lists recommended to me, and purchased for that quality alone, I confess that I cannot rank one-fifth of them among my pets whose features are always the same. I admit that most of those supplied to me as perpetual bloomers are rarely out of bloom; but two or three flowers on a large straggling head do not supply that striking and desirable feature which I consider invaluable in a Rose tree. I intend to turn out from my Rose borders all that will not keep a constant and abundant bloom. I must find a place for many of them, for the individual Roses are splendid; but I want no more in my flower garden than will keep up the main features of a Rose the greater part of the summer and autumn. I will assign the best of the others a quarter of less importance to the general appearance. I have ranges of Rose trees 4 feet from the paths on both sides, and these I want to be always in general bloom. *Crito.*

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND;

OR, TWO BIRDS KILLED WITH ONE STONE.

[for cottagers.]

Culture of the Mind.

The preface, my friends, shall be short, and my introduction shorter; for my wishes will be fulfilled should I succeed in showing that the Vine is useful as well as ornamental, and the care bestowed on its culture equally beneficial to body and mind. Furthermore, I hope that after you have digested for yourselves my remarks, you will be able to discover the plan, object, and use of them.

The margin adds grace to the stream.

A wink to the wise is better than a nudge to the foolish.

First, then, let us consider where the Vine naturally grows in its greatest perfection, and what conduces to that perfection of growth; and I think the question will be sufficiently answered for our purposes by broadly stating that the Vine flourishes best in a hot climate, and originally came from the East; also that it loves a mountainous district.

The less said the soonest mended.

Art is a distillation of Nature, by which its spirit is concentrated above proof.

Manures.—To be mixed with the soil when made for the border, the best are whole bones, hoofs of cattle; also cuttings of leather, woollen rags, feathers, hair, &c.

Riches, like muck, are of no use unless spread.

Liquid.—If the goodwife does any washing, apply the soap-suds on a summer's evening in drills, and rake the soil over. If the goodman kills a pig, do the same with the blood. Soot-water also; one quart of soot to 12 of water; drainings of dung-heaps, &c.

Top-dressing.—All prunings, leaves, weeds, &c., should be put into a heap to rot, or, what is better, charred in a slow fire kept smothered by soil, by which means all seeds, insects, &c., are got rid of, and all the nutritive part remains except the water. Apply it as a top-dressing in November.

A wise man scorneth nothing be it never so small or homely.

Never waste any vegetable matter, for what has once been vegetable is ready to become so again, and a person might as well expect abundance of water in a spring which he is constantly exhausting, should no rain fall, as plants to flourish when the vegetable matter, of which so large a part is formed, has been extracted and never given back to the soil.

Every little makes a mickle; every mickle makes a muckle.

Conclusion.—Perhaps one will say, "This is all very well, but it is a great deal more trouble than it is worth; besides, I have not time. It is very pretty amusement for those who have nothing better to do. So there's an end of the matter." First, be pleased to recollect that what is here put down, though it may seem a good deal, is to be spread over a good many years of 365 days each; a good deal of time to do a good deal in. 2. When it is well done the greater part is done for life; more, it will be a living memorial of industry and worth, more useful and lasting than a tombstone. 3. Nothing good is given to man without labour. 4. Labour makes a man, idleness fattens a pig. 5. It will give a higher standard of general cultivation, a greater interest in all the works of Nature, increase observation, teach the wonderful laws by which God is working every day, and induce a habit of thankfulness for His gifts. 6. The labour is at home, it may be, with the assistance of wife and children. 7. It makes home look cheerful and comfortable. Lastly, Grapes are very pleasant things to eat, are very wholesome, can be made into wine or turned into money, all or either of which are worth some labour. If you now think it too much labour, then go and eat (but not Grapes), drink (but not wine), sleep (if you can without labour), and be miserable.

As self-evident an axiom as the nose is part of the face, or that knowledge is not practice.

Always taking out of the meal-tub, and never putting in, soon comes to the bottom—as poor Richard says.

The lazy man exerteth himself to find excuses.

Who are they, pray?

The compiler answereth in eight propositions.

To everything there is a season—and a time to every purpose under the sun.

Well begun, half done.

A type of a well spent life, the older the more and better fruit does it bear.

An old saw that is not too rusty but it will still cut.

The argument toucheth the lazy man more nearly he yieldeth; he taketh a spade and he planteth a Vine.

VILLA AND SUBURBAN GARDENING.

Villa gardeners have peculiar tastes; some delight in the culture of Cucumbers, other prefer growing Melons; why, then, should there not be individuals desirous of producing in their little gardens their own Cayenne Pepper? A vast number who have only limited glass coverings, might easily accomplish the operation, and when once they have partaken of the produce of their own gardens, manufactured with their own hands, they will for ever afterwards eschew the foreign article.

A small long kind grown by market gardeners for the India pickle manufacturers, will be most suitable for the purpose. The Cayenne produced from it is pungent in quality, and being an exceedingly profuse bearer, it will be found not only the most eligible kind, but also the most profitable, and best suited for hot pickles. Some of the other varieties are equally good for both purposes; but being indifferent bearers, they are not to be recommended.

Early spring (the end of February, or beginning of March), is the season for sowing it, in order that the plants may be sufficiently advanced to enable them to have the summer months to ripen in. A small portion of seed will suffice. It should only be slightly covered, if covered at all; and the pot in which it is sown should be put in a warm place, such as in a pit or frame; and if a temperature of 60° is maintained, it will vegetate in 10 days. As soon as the plants are 2 inches in height, they may be potted into 3-inch pots, placing one plant only in a pot, and a good watering with tepid water should be given them. When the water has in some measure passed off, either by evaporation, or through the soil, place them in a similar temperature as before, close to the glass, to prevent their becoming drawn. Keep them moderately moist, and in a few weeks the pots will be filled with roots; no time should then be lost in shifting into the pots in which they are intended to produce their fruit. Permit me, however, to direct attention to the kind of compost best suited for them.

Take good loam (if of a turfy nature, so much the better), and add to it the charred refuse I formerly described, in the proportion of one-fifth, and no other ingredient will be required. Intermix them well, then place one crock over the bottom hole of the pot, cast a little rough soil upon it, and no other drainage will be necessary. A moderate-sized pot should be employed; the great growers for the London markets use what they term large 32s. When this is completed, supply them with water, keep down insects by the usual means, and your Cayenne Pepper may be said to be grown. It may be ripened in some seasons under hand-glasses in the open borders, but the produce is comparatively scanty.

By following the course above detailed, I have enjoyed home-made Cayenne Pepper for seven years, and I esteem it a great luxury. *Pharo.*

Home Correspondence.

British Song Birds.—Within the last 8 years I have been an occasional contributor; and the anecdotes I have forwarded to you from time to time in connection with certain feathered "pets" of mine, have, it would seem, afforded much gratification to your readers—so much indeed, that I have had repeated private applications and requests to give, through your columns, the result of my experience (some 25 years) in rearing and choosing our most favourite songsters, domestic and migratory. I have, moreover, been particularly requested to enter upon the subject of an aviary, its proper proportions, mode of fitting up, method of warming, &c. Now, as my collection has amounted to 366, at one and the same time; and as I have myself, *in propriâ personâ*, attended to all their little wants and ailments, and ministered to all their little harmless pleasures, deriving therefrom feelings of delight known only to an enthusiastic admirer of Nature's handy-work, I will, if you please, record in your Paper, weekly, and as briefly as may be, the result of an experience which can hardly fail to please as well as profit. It has been said, that "Truth is strange, stranger than Fiction." So I shall make it appear; for the more literally I adhere to truth, the more extraordinary will be found the particulars I shall have to communicate. On your wishes being made known, I will hold myself at your disposal. *William Kidd, Oct. 7.* [We are all expectation.]

Victoria Regia.—Thinking that possibly information with respect to plants of this celebrated Water-lily, grown in different parts of the country, may prove interesting to some of your readers, I beg to forward the following particulars of the plant in the possession of my employer. This plant was sent to Mr. Spode from Chatsworth in June last, in a small box; the leaves measured then about 4 inches in diameter. It was kept in a large tub till the 30th of the following month, July, when it was planted out in a tank measuring 24 feet by 21 feet. The leaves then were about 6 or 7 inches in diameter. The plant has since progressed favourably, and appeared very healthy. The tank is now quite filled with leaves, two of the largest of which measure 4 feet 1 inch in diameter; and this morning I discovered the first flower-bud, exactly 10 weeks from the day on which the Victoria was planted in its tank. There are now 13 leaves on the plant fully developed, and two others partially expanded. For the last 10 days the leaves have not varied much in size, several of them having grown to 3 feet 11 inches to 4 feet in diameter. The temperature of the water has been kept at about 85°. *George Bolas, gardener to J. Spode, Esq., Armitage-park, Rugeley, Staffordshire.*

Chara vulgaris.—Will you inform me what is the best method of eradicating this plant in an open reservoir where the water is used for domestic purposes? Is the plant poisonous? and, if so, can the water be used with impunity? Will it poison the water? A reference to a work in which it is described will also oblige. *A Water Drinker.* [Chara has a bad reputation, and is *said* to be at the bottom of the malaria of the Campagna. It is described in all works on the wild plants of this country.]

Mr. Cuthill's Treatise on the Potato, Asparagus, &c.—Will you allow me to add my testimony to the excellency of the plans published by Mr. Cuthill in his pamphlet for the growing of vegetables, but particularly for the growing of Potatoes and Asparagus. I do not know that Mr. Cuthill's mode of growing early Potatoes is a novel one, or of his own invention; and I believe

it is not; but I care not who was the inventor, so that the plan be a good one, and that it is so I have no doubt whatever. For example, my parish clerk, who is also a jobbing gardener, informs me that he has pursued the same plan for years, and with complete success; but it is possible that he might have obtained it from Mr. Cuthill himself, who some years back resided within four miles of this place. The system is simple and easy to be worked, and by it Potatoes may be produced for the table or market much finer and earlier than by any other plan I know. But with respect to the growing of Asparagus, I can state from my own experience that Mr. Cuthill's plan is, I think, quite perfect. I myself have practised it for about 13 years, and with surprising success. For example, 13 years since I took possession of a bed then exactly 30 years old, as the aged owner of it informed me; he likewise advised me to dig it up, as he said it was quite worn out. But I like experiments upon everything nearly, so I determined o try my hand on the old Asparagus bed, and thus I at once put the bed under the diet and regimen prescribed by Mr. Cuthill in his pamphlet; and the result was, that my old bed very soon became much better than a new one; year after year it kept improving, until, although the bed was only 30 feet by 4 feet, I could "cut grass" a fortnight or more earlier than my neighbours, continue cutting also longer than they did, cut almost daily, and my grass, I think—indeed, I know it is—equal to any in this part of the country; and the bed is as good and prolific as ever, although it is upwards of 40, that is, 43 years old. The plan is so easy to be worked and so simple, that any common servant, or any gentleman who can use a tool—and every one ought to use one, if he would study his health and happiness—may, with the greatest ease, put it into practice, and thus, with little labour and less trouble, have as much fine, large, and delicious Asparagus as he pleases; that is, if he takes care that his cook does not spoil it in the boiling, as most cooks do, and all other vegetables they lay violent hands on. Nor let it be understood that I am writing this account in favour of Mr. Cuthill himself, for I know nothing whatever about him, except that I sometimes read some sensible articles of his in your Paper, and that I approve of his pamphlet; or except, let me add, that I have a little fellow feeling for him, because I see in his method of growing garden vegetables the same principle that I myself have adopted for the growing of corn, and of which I have taken some pains to explain to others through the medium of the *Agricultural Gazette*. That principle consists in properly cultivating the soil, considering the nature of each kind of vegetable to be grown in it, and, like the Chinese, to give each plant its proper food. By this means Mr. Cuthill's vegetables are so fine, and are first in the market. *G. Wilkins.*

The Thrips here having caused great trouble and some loss, I can understand the anxiety many of your readers evince to obtain information as to the best means of destroying it, and therefore I send you our experience on the subject. As it made its appearance on a large collection of Indian Azaleas, which it almost destroyed, we tried repeated smoking with tobacco without any success; but we afterwards found that dipping them over head in very strong tobacco-water, and then placing them in the sun, repeating the operation after a few days, killed every insect; but this can only be done when the plants are small. Having mentioned the subject to Mr. Henderson, of Brechin, and told him that I had seen a large and very valuable collection of Dahlias destroyed, he said that he could give me a receipt which would kill this or almost any other insect that attacked plants. It was as follows:—To 1½ gallon of soft water, add ½ lb. of black soft soap and ½ pint of turpentine; this he assured me was the remedy he employed, and that it was in no respect injurious to any plant to which he had applied it. *J. R. Pearson, Chilwell Nurseries.*

Ice Pits at Cawnpore in the East Indies.—I hope that I shall be able to induce you to break through your rule of not asking your correspondents to reply to communications made to them consequent on what they may have written in your journal; some little feeling of pity may be excited by my mentioning that we scarcely ever, with the appliances of thermantidotes and tatti's, know what it is to have our rooms at a lower temperature than 85°, whilst outside, in the sun, the mercury rises to 140°, and in the shade to 100° and 106°; but to my subject. At page 21 of your volume for 1849, a very excellent article appeared, by Mr. Beaton, gardener to Sir W. Middleton, regarding an ice stack; and my present object is to ask his advice and opinion upon our pits in use out here. I will premise the difference in our ice itself and the mode of collecting it at this station of Cawnpore, and then put down the construction and size of the pits in which it is stored. Ice is collected from the beginning of November to about the middle of February; the field is of about 20 acres, divided into numerous beds, about 12 feet by 6, and sunk a couple of feet below the general level; a layer of straw, 2 or 3 inches thick, is spread over the bottom, and on it, in the evening, are placed small unglazed pans, previously well greased, or else the ice adheres so strongly that the endeavour to get it off breaks the pan, and at all times we are obliged to wait until the sun is sufficiently powerful to melt the ice in contact with the pans; these are 6 inches broad, and about 1½ inch deep, sloping at the sides; they are about three quarters filled with water; and if ice has formed during the night a gong is beaten about 4 o'clock in the morning, to call the coolies from the neighbouring villages—about 1200 are required. As soon as there is sufficient heat they get out the ice with an iron hook, about 6 inches long, and collect it in large baskets, in which it is conveyed to what are called the receiving-pits, which are about 20 feet deep, and 30 by 20 long; here it is raked, and all the straw, &c., with which it is intermingled got out. As soon as about 1000 lbs. are collected in these, on the same day, if sufficient has been made, it is taken into the storing pits, where it is well rammed down, but no salt used, as I have seen recommended in your Paper. On nights when all the water in the pans becomes frozen about 3000 lbs. are made; sometimes as little as 100 lbs.; and this is the smallest quantity it is worth while to collect. After the season is completed, the ice is carefully covered over and the doors closed. If a large quantity has been made, say from 22,000 to 26,000 lbs, we commence issuing on 1st of April, otherwise not till 1st or 15th of May. Officers who take shares send their servants in the evening, and the pits are opened about 1 A.M., The issue occupies about two hours; the ice is cut out and measured in small tubs holding 2, 4, 6, 8, or 10 lbs., according as each share may be. You will suppose that the ice is generally very thin, seldom half an inch thick, and when rammed down appears more like snow than ice. Now for the size of the pits. They are 30 feet deep, the diameter at bottom 24 feet, and at the top 27½ feet; at the bottom, 1 foot from the sides, a brick wall 1 foot high is built, on the top of which a sort of wooden coping is fixed, into which are inserted poles about 1½ foot apart; to these again cross pieces are fixed, and then laced up to the top with a kind of basket work, and the space between these poles and the sides of the pit is filled up with sugar-cane leaves, &c.; a second row of poles, about 1 foot nearer the centre of the pit, is then fixed and interlaced in a similar manner, and the interstice filled also with sugar-cane leaves, &c.; on the inside of this huge kind of basket a cloth is fastened stuffed with Grass, &c. The bottom of the pit is formed by beams of wood stretching across, and filled in with brushwood. To effect a good drainage the melted ice is carrried off by a copper pipe to a well dug outside, by which it is drawn up; at the top of the pit a space of about 3 feet broad is left by which to get round; a mud wall, 6 feet high, is then built, on which a thatched roof is placed; a further space of 3 feet is then left, and a second mud wall, with another thatched roof, carried up, and the space between the two walls filled in with straw or some other material. The doorway is on the south-west side and opens by a kind of passage open to the east; a kind of ventilation has been attempted, but is seldom in use. It is at the top of the conical roof; but there are no openings at the side; the wastage amounts to from two-thirds to three-sixths of the whole collected, and in some situations even to five-sixths. I shall feel deeply grateful to Mr. Beaton if he can suggest any remedy for this lamentable state of things. The ice is too precious a commodity to try experiments with, or I should have made one of the ice-houses mentioned by Mr. Beaton. I must again apologise for intruding, and trust you will assist me (and by doing so you will be conferring a favour on all the residents in Upper India) by pointing out any way by which the enormous loss from melting may be lessened, and informing me whether in your opinion an experimental ice-stack might be ventured on in a climate like this. Any suggestions should be accompanied by details. *John Eliot, Light Bengal Artillery, and Secretary, Cawnpore, &c.*

Pots for Layering Roses &c.—The accompanying is a sketch of a pot I have had made for laying Roses, &c., in.

There are two openings opposite each other, with a notch on one side of each to hold the branch, on the right of one opening, and the left of the other. These pots may be raised on stakes, and fixed with wires to enable the amateur to propagate any favourite standard Rose, and cultivate it on its own roots, which insures against loss of the particular kind; few Roses on their own foundations being destroyed by our winters, although budded varieties frequently perish. I have not seen any similar pots, and believe the idea to be new, but it may not be so. Why should not common pots be the same size, or almost equal, at the top and bottom? It would give more space for the roots of plants, without requiring more standing room. *Falcon.* [Obviously for this reason, that you could not so readily turn the plants out without disturbing the ball.]

Rabbits.—I would advise your correspondent, who enquires about rabbits, to try galvanised wire netting, about 3½ feet high; this will prevent the incursions of which he complains. As to his traps being incapable of holding them, if he is anxious of obtaining good steel traps, he should apply to a first-rate maker of traps. *Constant Reader.*

Diseases of Plants.—At p. 579, mention is made of the disease called hypertrophy, having occurred at Kew, in some species of Pleroma. Two varieties, but particularly elegans, have been affected here. We had it among other plants from a provincial nursery; it was then in good health in an 8-inch pot. Immediately on receiving it I shifted it into a 12-inch pot, in soil composed of turfy loam and peat well incorporated with sand and clean broken crocks to keep it open. The plant was placed in a stove; all went on well for a time, it made good roots and flourished. While we had sunny days no plant could succeed better; ultimately we had gloomy weather and cold nights. The atmosphere of the house fell several degrees; one day it would range from 75° to 80° by sun heat, the next from 60° to 65°. The house became cold and damp, and the heating apparatus being out of order, I was unable to have a fire to raise the temperature; Nature could not withstand such irregular treatment. Looking at the Pleroma one day, I observed it had a strange appearance; the main shoots exhibited dirty white or fawn-coloured callosities, which extended themselves along the laterals and midribs of the leaves. I took a part off and examined it; it appeared full of water. I first imagined that the plant had been watered too much, but when I turned it out of the pot there was no indication of that; the fibres possessed the healthy appearance which the roots of all plants ought to possess; the coldness of the house and too much dampness caused me to give it a change of treatment; having a dung frame at work, I plunged it in the manure, whose temperature was about 65° or 70°; I kept the frame quite close, sprinkling with water about 10 o'clock in the morning when the sun was out, and shading from about 11 until 3 in the afternoon. In three days the callosity began to get less, changing to brown, and then becoming a white fungus or mildew, resembling that often to be seen on beer casks in cellars. The leaves which were attacked became yellow, and in about 10 days fell all off. The plant is now looking tolerably healthy, and is quite free from any callosity or mildew. The disease appears to be caused by mal-treatment. The plant was attacked in a cold damp house, but when it was removed to a more genial atmosphere, it soon recovered; too much water floating about the house, with too little heat, and that irregular, seems to lie at the root of the evil. The only sure remedy is a warm, sweet, healthy atmosphere, and effectual drainage; but I do not call placing a few broken crocks at the bottom of the pot, and the filling up with finely-sifted soil deprived of all its fibrous matter, effectual drainage; this is the bane of pot culture, from which more plants look and are unhealthy, and die in one year, than from any other cause. How many plants might have been alive now, and doing the cultivator credit, but for this cause! Under such circumstances, can we wonder when we hear of over-watering, crocks filled with soil, causing stagnation, &c.? The roots cannot perform their functions; they rot, the plant becomes sickly, and dies; but let a plant have one-third broken crocks and rough charcoal, then a layer of moss or turf, to keep the soil from the crocks; let the soil be broken with a spade or hand, some clean crocks, charcoal, and sand, well incorporated but not sifted, and a good drainage (allowing all surplus water to pass off) will be effected. No moss or fungus can grow on soil so arranged, and I never saw a plant in good health where these existed. *D. J. N.*

Societies.

Entomological, *Oct.* 7.—G. R. Waterhouse, Esq., President, in the chair. Amongst the donations was a small collection of insects from Hong Kong, sent by J. C. Bowring, Esq., including specimens illustrating the transformations of a most remarkable Lepidopterous insect, which is parasitic upon the Fulgora candelaria, and which, in the larva state, is densely clothed with a white waxy secretion, like some of the Coccidæ. The President announced that a new Part of the Transactions was ready. Mr. Stevens exhibited some very beautiful insects, just arrived from South America, collected by Mr. Bates on the banks of the river Amazon, 1500 miles from its mouth. Specimens of a new British moth, Ilithyia acuella, from Deal, were exhibited by Mr. Shepherd, and a hermaphrodite, Arctia Caja, by F. Bond, Esq. Mr. Gould exhibited specimens of the 7-spotted Lady-bird, and of the larva of Arctia menthastri, found impaled alive on the spines of Gorse bushes, in Inverness-shire; and as this locality is too far north for the strikes (by which it has generally been supposed that insects found in such positions have been impaled), it is evident that these insects must have been thus fixed by some other animal or bird with whose habits we are at present unacquainted. Captain Parry exhibited the cocoon or case of Goliathus Drurii, inclosing the perfect beetle, which had continued alive for some time after its arrival in this country. The cocoon is oval and very thin, being formed of fine agglutinated particles of sand. Mr. Westwood exhibited the larvæ of Aposte capucina and Lymexylon navale, communicated by Sir T. S. Pasley, from Pembroke dockyard; and Mr. Douglas, a specimen of Hypera Rumicis, a small species of weevil, which he had reared from a beautiful open net-work cocoon, which was subsequently devoured by the perfect insect. A note was read from Mr. E. Newman on the different modes adopted by different species of bees, in order to reach the honey in the flowers of the common Snapdragon. Megachile centuncularis creeps with its back downwards into the flower, by which means its ventral surface becomes coated with pollen, which the bee uses in the economy of its nest. One species of humble bee (Bombus) enters the flower with its back upwards, whilst another species of Bombus invariably bites a hole through the tubular base of the corolla. The fact that a bee never revisits a second time a flower which it has already deprived of its sweets, was also noticed. Other bees, however, visit such flowers; but immediately on discovering that they have been already rifled of their sweets, they fly off with an angry kind of hum.

Miscellaneous.

New Method of Grafting Fruit Trees.—M. Vard has made known a new method of grafting, purporting to be discovered by himself. The operation, which is performed in the spring, is as follows; a shoot of the previous year, having one or two eyes, is taken and shaved into a longish cylindrical form, immediately below the lower eye; a hole, 2 or 3 inches deep, and as large as the graft, is then bored in the stock; the graft is placed in this hole, and is driven in until it fits it exactly, leaving no space between itself and the stock. If this is done, the libers will be in closer contact, and the joining of the graft more sure. The place from which the graft was cut is covered with grafting mixture, and the operation is finished. The commission which have enquired into this matter, have come to the conclusion, that M. Vard cannot claim to be the inventor of this method. They find it mentioned in a treatise on grafting, by André Thouin, published in 1822, under the name of the plug-graft, which, according to the author, was used by the Romans in grafting their Olives and Vines, and is mentioned by Terence, the agricultural writer of those days. The commission have endeavoured to ascertain whether this plan of grafting is likely to be of any importance. M. Vard says it may be used with advantage; 1st, in filling up with branches spaces left in pyramids; 2d, in introducing on lateral branches fruit-spurs, if they, and where they, are absent. As to the first of these uses, the commission have remarked that the grafts of last spring resemble fruiting branches more than common branches. They think that this is owing to the almost horizontal position of the graft upon the stock, the ascent of the sap of which is consequently obstructed, and they decidedly prefer Richard's side grafting, heel-grafting, or spur-grafting, whenever this is possible, if the object aimed at is the filling up the spaces left in pyramids. With regard to the second advantage attributed to this method, the commission think that it is real, and important. The plug-graft is easy of application, requiring no ligature, is quickly inserted, and is by no means unsightly. These advantages the commission think will cause the present plan to be preferred to others now in use, when the object is to obtain fruit spurs from branches which have them not. *Revue Horticole.*

Summer Grafting.—M. Loiseau employs for cleft and crown grafting in April, May, and June, eyes which, at the base of the shoots, buds, or branches of the preceding year, have not been developed. After the end of June, when the young shoots have become a little hard, they may, after their leaves are cut off, be grafted just as the same branches would be grafted in the following spring. If the shoots are still too tender it is as well to varnish them with grafting wax. M. Loiseau made in this way, from the month of May to September, more than 150 plants both from seeds and from stones, and he did not lose more than one-fifth, although his experiments were made on a very dry soil, and no care was taken to protect the grafts from being destroyed by birds, or by the dryness produced by the great heat of the months of June and July. He even succeeded in cleft-grafting an Apricot in July. In May, 2 out of 15 grafts failed; in June, 3 out of 12; in July 3 out of 15; in August 0 out of 12. It may be as well to remark, that a tree cleft-grafted in May, June, and even early in July, very nearly overtakes that grafted in the spring, and there is very little difference between the two at the end of the year. Moreover the cleft graft, if made in summer, begins to grow after a week, whilst the bud does not begin to grow till the end of a fortnight. The cleft graft has also this advantage over the bud—that the former does not require the bark to be separated, indeed the less sap there is in this graft the better. *Comptes Rendus.*

Vegetable Tallow.—"A very light fat so called by foreigners, of which candles are made in China. This substance has the advantage over animal tallow, that the candles made from it neither melt nor smell. The tallow is obtained from a tree called Kau-Shu, which grows over nearly the whole of the low land of China, and the fruits of which (Kintze), resembling a white Bean after the shell has been removed, furnish on pressure two products, one liquid like oil, the other hard like tallow. I have never met with the oil in commerce; the tallow, on the contrary, is an important article of commerce in China, and varies in goodness; that produced in the neighbourhood of Canton is neither so hard nor so white as that from the province Chejang. Ningpo is the right place to buy at; the price, 8 to 9 dollars per picul (133⅓ English pounds)." Osbeck saw the Tallow-tree in 1750-52. According to him, the tree was called O-ka-o, is only 6 feet high, and grows in the neighbourhood of water. M. Liljewalch mentions, in a letter to Prof. Berlin, that it is not impossible, considering that the tallow produced in North China is harder, and also that the harvest takes place there in October, whilst in Southern China the fruit is already ripe in June and July, that two different kinds of the Tallow-tree are cultivated. Osbeck, who visited only the southern part of China, would, according to this, have seen a different Tallow-tree from that seen by Liljewalch. However, the difference of the tallow may be explained by the different position of the land, and also by the different modes of preparation. *J. B. Von Borck, in the Chemical Gazette.*

Willison's Rose Nursery, Whitby.—Early one morning in July (and the morning, as Mr. Paul says, is "the fittest time for these rambles") I paid a visit to Mr. Willison's Rose Nursery, which is situated about a mile to the eastward of Whitby, and known by the name of "New Gardens," in which we have another instance, among many, of the impropriety of designating any place by the term *new*. These gardens are now nearly 200 years old, as appears from the following inscription on a stone originally built in the wall: "I Sr Hvgh Cholmeley Kt and Barronet and Elizabeth my Deare Wife (Davghter to Sr Will: Twisden of Great Peckham in ye Covnty of Kent Kt and Barronet) bvilt this Wall and planted this Orchard Anno Domini 1652." Under these lines is a shield bearing the arms of both families empaled, with the word *Cholmeley* near the Chomeley arms on the dexter side, and the word *Twisden* near the Twisden arms on the sinister side. Beneath the shield are these two lines:

"Our handy worke like to ye frutefull tree
Bless thou, O Lord; let it not blasted bee."

The garden was cultivated almost exclusively for vegetables and horticultural produce until the year 1812, when a part of the ground was appropriated and converted into a Botanic Garden, Mr. Alexander Willison, the present lessee, being appointed the Curator. The collection of botanical plants was never considerable, but included several very rare specimens. About the year 1828, the botanical department was discontinued for lack of support. Shortly afterwards, Mr. William Willison, the son of the lessee, began to cultivate Roses, and paid considerable attention to the raising of seedlings. At this time it was the only Rose-nursery in the north; in fact, I believe this was the only nursery in England where Roses were cultivated for sale to any extent, unless it was Mr. Rivers, who began some time about the same period. The soil is of alluvial loam, tolerably stiff, and of considerable depth. There are about 700 varieties in cultivation at this nursery, comprising all the newest and best Roses grown, besides a great number of very fine seedlings. The Roses appear to thrive the best here cultivated as "pillar Roses," trained to tall pillars, and when in full bloom have a very fine effect. There are very few standard Roses in the nursery, except those cultivated for sale. A great number of the China, Noisette, and other fine Roses do not bloom well in this locality except under glass; the bloom-buds rarely expand. I will therefore enumerate a few good Roses that appeared to bloom here in perfection. *Ayrshire:* Ruga, flesh; Queen Victoria (Willison's), rosy lilac, blooming in graceful clusters. *Multiflora:* Model (Willison), purple, a beautiful Ranunculus-like flower. *Hybrid Sweet Briers:* A great number of double and semi-double varieties. *Moss Roses:* Celina, crimson; Curled Crested (Willison), fine red. *French:* Œillet parfait, striped; Queen (Willison), dark-shaded maroon; Prince of Wales (Burgess); George Glenny (Burgess). There were several other fine Roses of Burgess's, but the above were of superior character. Boula de Nanteuil, crimson purple, superb. *Hybrid China:* General Kleber, deep crimson; Comtesse de Lacepède, pale blush; Triomphe de la Guerre, lilac rose, fine, a splendid pillar Rose, and blooms profusely here. *Alba:* Madame Legras, fine white. *Hybrid Bourbons:* Mottled Great Western (Willison), very fine, and more double than Great Western; Mrs. Ellis, fine pink; Paul Perras, shaded rose; Coup de Hébé, bright rose; Belle de St. Cyr, bright rose. *Hybrid Perpetuals:* these were not so finely in bloom as I have seen them—the most striking were Baron Prevost, pale rose; Géant des Batailles, brilliant crimson—this is an excellent Rose for the north, it is a free bloomer, and opens well; Robin Hood, cherry red, and Comtesse Duchatel. *Bourbon:* Acidalie, the finest blush white; Paul Joseph, crimson purple, inconstant in this locality; Souvenir de la Malmaison, pale flesh, and superb, but this Rose pushes rather too early in spring for this locality, and consequently often gets much cut with the cold north-east winds to which we are subject; Souchet, crimson; Madame Angelina, rich cream, fawn centre. *China:* Mrs. Bosanquet, pale flesh; Marjolin du Luxembourg, deep crimson; Milk-maid (Willison), blush, fine wax-like bud. *Tea-scented:* Vicomtesse Decazes, deep yellow, ex.; Devoniensis, creamy white, fine; Elise Sauvage, yellow buff centre, appeared to bloom very freely against the wall in these gardens; Niphetos, pure white. *Noisette:* Hardy, fine; Solfaterre, bright sulphur: very few Noisettes bloom well here; Cloth of Gold and Lamarque were tolerably fine against a wall with a south aspect; also several beautiful plants in fine bloom of Smith's Yellow, or rather, as I understood, a freak of that variety, which always blooms full in the centre, the original variety generally presenting a gawky centre in this locality. There were several seedlings of Mr. Willison's of considerable merit, which have not yet been let out; among which I particularly noticed, La Exquisite, d p., a nice full flower, of tolerable size; Ephraim Holding, a very compact flower, but I scarce know to which class it most properly belongs. Margaret Jane, h.c.: fine pinky Rose, a beautiful full and compact flower, the most perfect gem in these gardens; Victory, h.p., a nice full globular Rose, but we have many of the same style of flower; Globosa, h.b., crimson purple, very fragrant, and a profuse bloomer; Marchioness of Normanby, h.p., fine pink, and a very perfect flower. There is nothing very striking in the management of these gardens, having been designed more for the convenience of propagating and cultivating the Roses for sale than mere effect. Several of Mr. Willison's seedlings have been sent to the Worton Cottage Meetings; but were so much injured in the transit as to render the blooms unfit to report upon. *Beck's Florist and Garden Miscellany for October.*

The Kamtchatka Rhododendron; (Rhododendron Kamtchaticus.)—For this great rarity and exquisitely beautiful shrub we are indebted to Mr. Loddiges, whose predecessors raised it from seed about 20 years ago. It appears to be of slow growth, as the plant is now only about 10 inches high, forming a compact bush. Mr. Loddiges finds it perfectly hardy, but it is best kept under a north wall. It is admirably adapted for rock work in a shady situation. According to Pallas this charming plant grows abundantly near the sea of Ochotsk, in the peninsula of Kamtchatka, and in Bhering's Island in muddy mountainous places. There it begins to blossom from the end of July, grows vigorously to the end of August, and ripens its seeds about the end of September. The root, he says, is woody, dry, as thick as a quill, and forms creeping runners. From this arise a great many leafy stems, which every here and there break into flower. The leaves are close together, alternate, sessile, somewhat ovate, tapering downwards, somewhat 5-nerved, rather sharp-pointed, perfectly entire, and fringed with very perceptible hairs. The peduncles are 2 or 3 inches long, closely surrounded by small leaves, besides which there are generally about two ovate sessile leaves; they are 2-flowered, or occasionally 1-3-flowered, and very hairy. The flowers are nodding, and deep purple. The sepals leafy, 3-nerved, two being nearer to each other than to the others. The corolla is irregular, rotate, with a very short funnel-shaped tube, and a deeply 5-lobed limb; the segments lanceolate, downy at the throat, unequal, the three uppermost rather the smallest, and less deeply divided, spotted with crimson at the base, standing up like a hood, the two lower very much spreading and spotless. The stamens, which arise from the bottom of the flower, are 10, curved downwards, the upper shortest, the lower twice as long as the others, not so long as the corolla, with ovate, double, deep purple anthers. (Fl. Rossica, vol. i., p. 40.) To the locality given by Gmelin and Pallas, Ledebour adds the following: Mount Marekan according to Turczaninoff, the country of the Tschuktskes in the Bay of St. Lawrence, Kamtchatka and Unalashka. Sir W. Hooker gives Banks's Island and Port Edgcombe, on the north-west coast of North America. It is, therefore, clear that it belongs to climates far more rigorous than our own, and with much worse summers. And this is the key to its cultivation. Like the R. Chamæcistus, it is unable to endure the drier air and brighter summer sky of England; but shrinks from our heats, and withers beneath such evaporation as leaves undergo in this climate. Hence the wisdom of the treatment which consists in keeping such plants in a cold pit closed up all day, and uncovered all night. Mr. Loddiges' cultivators made nothing of it till they put it under a north wall where Liverworts and such soft flabby plants delight to dwell. We do not believe that any botanist would have thought of calling this a Rhododendron had not Linnæus set the example by including the Chamæcistus in that genus. Its great leafy calyx, flat corolla divided almost to the base, and nearly equally spreading although very unequal stamens, are quite at variance with Rhododendron. Neither has it the scurfs or stellate hairs observable, we believe, in all the genuine species in which hairs are ever found. On the contrary, the hairs are always simple, in which respect it agrees with the Chinese Azaleas, to which it is more nearly related than to Rhododendrons, but from which its corolla, almost divided into separate petals, sufficiently divides it. To this may be added, the singular gland at the end of the leaves, a nearer approach to which is to be found in the scaly Azalea (A. squamata) than in any Rhododendron we have examined.—*Paxton's Flower Garden.*

Plant Sales.—The entire stock of the Kamtchatka Rhodotham, in all 61 lots, of from one to four plants each, was brought to the hammer yesterday by Mr. Stevens. They fetched from 1*l.* to 1*l.* 10*s.* per lot. Also 60 lots of Orchids, which realised the following prices: Cattleya marginata, 1*l.* 6*s.* to 5*l.* 5*s.*; other Cattleyas from 1*l.* 4*s.* to 4*l.* 8*s.*; Miltonia cuneata, from 1*l.* 10*s.* to 3*l.* 12*s.* 6*d.*; other Miltonias, from 1*l.* to 1*l.* 5*s.*; an orange-flowered Lælia, from 1*l.* 4*s.* to 2*l.* 10*s.*; a Huntleya, from 15*s.* to 18*s.*; and an Odontoglossum 1*l.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory.—Use fire heat as little as possible, and only in conjunction with a free circulation of air. Thin out and regulate the pendent shoots of climbers, so as to admit the light to the plants below. As many of these beautiful plants are now ceasing to flower, their shoots may be freely thinned; but it is not necessary to make the wires bare and naked all at once, as a few may be retained to give a more cheerful appearance to the house during winter, without depriving the plants of light; and in spring, just before they begin to break, they may be pruned more closely. The shoots which are to be left during winter should be thoroughly cleared of insects. Flower House.—The house in which the principal display of flowering plants is made, should be kept sufficiently warm, to prevent any injury to those plants which have been brought forward in heat, avoiding draughts of cold air; but allowing sufficient ventilation to prevent damp condensing about the flowers. The necessary amount of air should be given by partially opening every side ventilator, and every moveable sash, also, unless in rainy weather. This is much better than admitting sweeping volumes of cold

air by opening only a few of the ventilators to a greater extent. Pits and Frames.—Forcing of plants into flower will now occupy a portion of these ranges, where a considerable display is required during the two last months of the year. In all cases let the excitement be very gradual at first, and by means of bottom heat keep the roots a little in advance of the tops. If the Hyacinths were potted at the time and in the manner recommended, they will now have filled the pots with roots, and a portion of them may be taken up and plunged where there is a slight bottom heat; but unless wanted very early, let it be very moderate, and accompanied by a free admission of top air. Encourage Mignonette with manure water, and remove any flowers which can be spared, to give greater strength to the plants.

FORCING DEPARTMENT.

Pineries.—Where the plants are now swelling their fruit, let the temperature be well kept up. Where the succession plants are grown, a gradual hardening process should be adopted, not suddenly to check or prevent their growth, but to reduce its rate by gradually lowering the night temperature, and admitting as much air during the day as the strength of sunlight will allow. The heat, however, during this month should not be allowed to fall below 60° in the morning. Plants swelling their fruit may still, with advantage, be supplied with liquid manure. Vineries.—In applying fire heat to drive damp out of those houses where ripe Grapes are hanging, let it always be accompanied by air, or it will defeat the end aimed at; and even then it must be very moderate, or the Grapes will soon begin to shrivel: it is a nice point to steer between the two extremes, but if it be desired to preserve the fruit in good condition till January or February, no care or trouble must be considered too much. If any Vines have been prepared in pots or boxes for early forcing, a portion of them should now be pruned and well washed; at the same time any exhausted soil from the surface should be scraped off, and replaced by a top-dressing of rich loam and dung. The plants should then be introduced into a forcing-house or pit, with a temperature of about 50°. This must be gradually increased at the rate of 3° or 4° in a week. If the pots can be plunged in a bed about 15° hotter than the temperature of the house, it will be a decided advantage, as the roots will be thereby kept in advance of the tops. Let the plants be syringed once or twice every fine day; and if a quantity of fermenting material can be introduced, the exhalation arising therefrom will considerably assist the development of the buds. Peach-houses.—The later forced houses will now be ready for cleaning and retraining, in the manner formerly described. This work should be done as soon as possible, that it may not interfere with the out-of-doors training, which should be commenced next month. Forcing Pits.—Rhubarb, Seakale, and Asparagus should now be in progress. The two former may be managed very well in any place possessing the characteristics of a Mushroom-house, namely, moderate warmth and exclusion of light. For Asparagus, a pit or bed should be prepared, furnished with bottom heat by dung or hot-water pipes. Light and air are necessary to this crop to render it fit for use. Nothing can be more absurd than blanching it, by which its flavour as well as its appearance is destroyed.

FLOWER GARDEN AND SHRUBBERIES.

Very little can be added to former Calendars, in reference to this department, except that the general taking up of choice half-hardy plants should be proceeded with. There are thousands of plants, which, if taken up and potted in autumn, would, if they survived, prove invaluable in the following season, from their producing a greater amount of bloom than young plants; but few have much room for keeping them during winter, in suitable places. Geraniums are amongst the most useful of the flower-garden plants which deserve this care, and are, perhaps, the most easily managed. Unless very large specimens are wanted for next year, let the sides of the plants be pruned in, so that the pots may stand close together. All flowers should be removed; but, with the exception of side pruning, every healthy leaf should be preserved, until the plants are established in the new soil, after which they may be cut down to any convenient height. If the soil is moist at the time of potting, Geraniums, Crassulas, Mesembryanthemums, and other succulents, should have no water till they have commenced to root; it is by the abuse of this agent that hundreds of plants are killed. After potting, set them on the north side of a wall, where they will have some shelter from cold winds, as well as that afforded them from the sun by the wall. To ward off sudden frost during night, place some clean poles sloping against the wall, to support a sheet of canvas. In such a situation they will soon recover; and when they appear to be making a new effort to grow, let them be placed in cool Vineries, Peach-houses, or frames, from which the frost is just excluded.

FLORISTS' FLOWERS.

Dahlias.—The late severe gales have made sad havoc with these noble autumnal flowers. The plants should be gone over, and the broken branches pruned away, gathering any pods of seed which it is desirable to save. Should the weather prove open, they will contribute still to the gaiety of the flower garden. Precautionary measures however should be taken to prevent the frost (should it come suddenly on), injuring the crowns of the roots, by drawing the soil carefully round. Look after the weak and late blooming seedlings; they are often the best. Auriculas may now be placed in their frames, allowing abundance of air, either by placing bricks under the corners, if of wood; or by keeping the slides open in the sides of the frames, if of brick. The lights should be kept over the plants when heavy drenching rain is falling. Should any of the plants show a flower stem, which they will sometimes do, it will be requisite to destroy the pips. This should be done by removing them as well as the foot-stalks, but by no means should the stalk be broken over, as it will sometimes rot, and by so doing carry disease into the heart of the plant. Carnations and Picotees.—Continue potting off, as the layers are ready. Beware of too much moisture. Nothing is so bad as damp for these very hardy plants, at this season of the year. Hollyhocks.—Do not delay making the necessary plantation, either plant singly on soil well enriched; if in rows, they should stand at least 6 feet asunder. Very fine varieties have been exhibited in Regent-street during the season; and for a first-rate selection, our readers may consult the report thereon.

KITCHEN GARDEN.

Let the autumn-sown Onions, Cabbages, Cauliflowers, and Lettuces, be protected from the ravages of snails, by dusting them with lime and soot. The smallest of the Cauliflowers not planted in hand-lights should be planted in a cold frame, where they can be protected from frost. Cold frames and covers for them should be immediately prepared and filled with Endive and Lettuce for winter and early spring. Let the ground beneath the frames be well drained, and a layer of coal-ashes placed below the soil, which will help to keep it dry, and prevent the upward progress of slugs, &c. A soil consisting of charred loam and leaf-mould, which should be moderately dry and free from insects, is best for this purpose. The plants should be lifted from the borders with good balls, and transferred to the frame, taking care not to break or injure the leaves. The latest crop of Cabbage Lettuce, intended to stand during winter, and come in for early spring use, should be planted in the driest, warmest, and most sheltered border, as it is an object of no small importance to secure a supply of this favourite salad. In very severe weather they may be protected by Fir boughs. For the protection of winter salads, as Endives, Lettuces, and late Radishes, and for preserving Cauliflower plants during winter, light wooden shutters will exclude frost better than glass sashes and wet mats; and as they are much less expensive, are in every way preferable. Light can be admitted by tilting the shutters at the back during rainy weather, and by removing them entirely when it is dry without being frosty.

State of the Weather near London, for the week ending Oct. 10, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 14th 1834—therm. 71 deg.; and the lowest on the 19th, 1843—therm 22 deg.

Notices to Correspondents.

Back Numbers of the Gardeners' Chronicle: The publisher begs to say that the following may be had. Any subscriber who will forward postage stamps equivalent to as many numbers as are required, will have them sent free by post. The volume for 1847, price 30*s.*, and volume for 1848, price 30*s.* 6*d.*, can still be had. The volume for 1849 is now ready, price 30*s.* The volumes of former years are out of print.

1841—1, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 45, 46, 47, 48, 51.

1842—1, 4, 6, 8, 10, 11, 16, 18, 20, 31, 32, 42, 45, 50, 51, 52.

1843—13, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 37, 40, 41, 42, 48, 49, 50, 52.

1844—All except 33, 36, 37, 46, 50.

1845—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 13, 14, 15, 17, 18, 19, 20, 21, 23, 24, 25, 27, 28, 31, 39, 40, 41, 42, 43, 44, 45, 50, 51, 52.

1846—4, 5, 6, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 42, 43, 46, 48, 49.

1847—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 16, 19, 20, 21, 22, 27, 28, 29, 32, 33, 36, 37, 41, 42, 43, 44, 45, 46, 47, 48, 51, 52.

1848—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 30, 33, 34, 36, 37, 39, 40, 41, 44, 45, 47, 48, 51, 52, 53.

1849—All except 46, 47, 49, 52.

Bees: *Anna.* You had better apply to Mr. Milton, 10, Great Marylebone-street, London. *Y.*

British Association: *Henry.* The reports are published annually, and we presume may be purchased through the booksellers.

Broccoli Fungus; *Lyston.* The Broccoli leaf is infested with Cystopus candidus, Lév., of which you will find a full account in the Journal of the Horticultural Society of London.

Creepers; *D and N.* Aristolochia Sipho will, we imagine, answer your purpose.‡

Dahlias: *C Q.* They come from Mexico. Their roots are perennial. Read Phillips' "Flora Historica."

Dibleton: *J M.* Much obliged, but the matter is merely of local interest. The remark about the chimney-pieces reminds us of the man who maintained that a child could not be 10 years old, because to his certain knowledge its frock was only six months old.

Diseased Pear Leaves: *W.* We have always found a little Acarus in the spots on the Pear leaves, which are very common, and believe that they are due to the presence of the insect. As the Acarus burrows into the leaf it is very difficult to suggest anything for its removal. Early syringing might possibly be of use, for the removal of this and other little pests.

Fences: *W K.* Privet, Holly, Yew, if not too high; for a dwarfer kind, Tree Box; for one dwarfer still, Cotoneaster microphylla. A low fence might be made of Savin, by clipping it regularly.

Fruit Trees: *Thomas.* For your south wall, the Royal George, Grosse Mig onne, Noblesse, Bellegarde, and Late Admirable Peaches; the Elruge, Violette Hâtive, and Impératrice Nectarines; and the Large Early Apricot. For the east aspect, Royal and Moorpark Apricots, Greengage Plum; May Duke and Elton Cherries; Glout Morceau and Passe Colmar Pears. North aspect, three Morello Cherries, two Kentish do., Orleans Plum, Jargonelle Pear.‖—*E T C.* You may substitute the Stanwick Nectarine for the Noblesse, if you can at present obtain it. Of the others, you would best procure one-year-old trained trees. The Vines you propose will do, the Cannon-hall being planted at the warmest end of the house. For south wall, the Large Early and Royal Apricots; Noblesse, Royal George, and Bellegarde Peaches; and the Violette Hâtive Nectarine.‖—*M J B.* Four dessert and eight kitchen Apples for espaliers: Dessert—Golden Reinette, Ribston Pippin, Court of Wick, and Scarlet Nonpareil. Kitchen Apples—Hawthornden, Keswick Codlin, Blenheim Pippin, Bedfordshire Foundling, Beauty of Kent, Dumelow's Seedling, Rymer, and Mère de Ménage.‖

Greenhouse: *Country Parson.* We find nothing of importance in your plan which requires criticism; quite the contrary. Employ two 4-inch pipes, the upper for the flow, the lower for the return. For so small a house you will have heat enough without passing the dining-room door; at that point we should return the pipe. As Yorkshire stone seems to be plentiful with you, we should use it for the shelf, and support it on 4-inch brickwork. Plant your Vines outside the front wall. Get a Chasselas Musqué, in order to vary the sameness of so many White Muscadines. The hollow space under c may be made useful either for forcing Rhubarb, Seakale, &c., if kept damp; or for preserving such roots as Dahlias, if kept dry. We prefer the slope in pencil to that in ink.

Heating: *W K.* There is a full account of Polmaise heating in the Journal of the Horticultural Society, vol. ii., part 1; and very numerous sketches and plans in our volumes for 1846, 1847, and 1848. The cheapest apparatus is the common brick flue, which, *well built, well managed,* and *kept clean,* is as good as any other. Polmaise answers perfectly well, when properly constructed, and when a sufficient heating surface is provided.

Insects: *Tim.* If you *will* allow your trees to be infested with the mussel scale, you *must* expect the fruit to be covered with the same vermin. There is no means of cleaning it except by scrubbing it two or three times with *hot* water.—*T C.* 1, Pimpla manifestator; 2, Dioctria œlandica; 3, Alomyia Victor; 4, Pompilus exaltatus; 5, Ichneumon raptorius; 6, Alomyia semiflava; 7, Allantus solitarius; 8, Allantus ater; 9, Helophilus pendulus; 10, Helophilus bortorum. We must request our correspondents to confine their queries to the objects of the *Gardeners' Chronicle,* as most of the insects now, and on several previous occasions, sent by "T. C.," have no connection therewith. *W.*

Manures: *H B.* Bed-chamber slops, urine, &c., if allowed to stand for a few weeks, are good liquid manure for Chrysanthemums, Camellias, and pot plants in general, when manure is wanted. But it is far better to soak in them leaves, cinder dust, charcoal powder, and similar materials, and to use the mixture.

Morphology: *Morningside.* A very complete example of a common occurrence. Usually but one sepal assumes the leafy state.

Names of Fruits: *Micklewell.* 1, Beurré Rance; 2, Beurré Diel; 3, Passe Colmar; 4, if you compare the wood and leaves you will doubtless find the former yellow and the latter oval agreeing with those of the Passe Colmar; 5, Old Colmar.‖—*A C.* 1, 3, Passe Colmar; 2, appears to be Flemish Beauty; 5, something worthless; 6, decayed, so that it cannot be determined whether it is the Kilwinning or common Calebasse.‖—*J C.* 1, Lechfriande? 2, Glout Morceau; 3, Beurré Diel; 5, appears to be Knight's Monarch; 6, White Doyenné; 7, perhaps Passe Colmar, imperfect from a late blossom; 9, Winter Nelis; 10, Comte de Lamy; 11, Easter Beurré; 12, Henri Quatre. Apple No. 1, Court-pendu Plat.‖

Names of Plants: *J D.* Blitum virgatum.—*Curious.* We have seen the plant before, and remarked its distinctness from C. crenatus. We believe it is not yet named. It does not appear in the recent enumeration by Prince Joseph of Salm Dyck of the plants of the order.—*W S.* Ceanothus azureus; it is a greenhouse plant, or at least is scarcely hardy. Take up the Tigridias now; dry the roots thoroughly, and keep them through the winter dry, and where frost cannot reach them. —*G M.* Diplotaxis tenuifolia, Valantia cruciata, and some Campanula, not to be determined by such a specimen, which has no radical leaves.—*Diss.* Alva, or rather Ulva marina, is the common Zostera. *M. J. B.*—*Vitis.* 1, 3, and 5, Lastrea spinulosa; 2, Polystichum aculeatum; 4, Asplenium Filix-fœmina; 6, Osmunda regalis; 7, Asplenium lanceolatum. The latter and A. Adiantum nigrum are continued as two distinct species in the new edition of "British Flora." *S.*—*W W F.* Hymenophyllum Wilsonii. *S.*—*Oulton.* The Dari seed is Durroo, the corn of a kind of Grass called Andropogon Sorghum aliàs Holcus Sorghum. There are many varieties of it. You cannot cultivate it profitably in England. —*Todd.* 1, Epidendrum cochleatum; 2, Liparis longipes.—*Micklewell.* Next week.

Rats: *W P P.* Oil of Rhodium will attract rats. Is that what you want to know?

Seeds: *B.* Send your friend in Bombay all sorts of the newer flower and vegetable seeds except such as come to us from India itself. All sorts of Californian, Mexican, and New Holland plants are acceptable there.

Shrubs: *A J B.* Tree Box will possibly suit your purpose.‡

Sewage: *W S.* R. Phillips, Esq., Museum of Œconomic Geology, Jermyn-street.

Tolls and Tan: *A B.* Tan is not manure, and, we suspect, liable to toll. You should consult your solicitor.

Victoria: *W T.* We decline acquiescing in the change of *V. regia* into *V. reginæ,* or *V. amazonica,* for reasons which will be given in Paxton's "Flower Garden," when Sir W. Hooker's illustrations of the plant shall have appeared.

Walnut Grafting: *A Constant R.* This can only be performed in the spring. In ample time for next year we will tell you what is known about the operation.

Vines: *Vitis.* We see no objection to your planting in the border inside the pit by the back wall, and training down the sashes. The roots will not be too far from the glass; we imagine you will have heat enough from a well-constructed flue to carry out early forcing.‡

SEEDLING FLOWERS.

Dahlias: *N G.* Your "Fancy," No. 13, is a full flower, of good average form, large and showy—an essential quality in this class of Dahlias. The colours are similar to those of Master G. Clayton; but in other respects it is much superior to that variety. No. 17 (carmine) is neither novel nor good.*

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES FOR WHEAT SOWING.—On Sale, Guano (finest Peruvian), Superphosphate of Lime, made from Bone, Bone-dust and half-inch, Dried and Prepared Night-soil, Urate, Gypsum, &c. Also Foreign and English Linseed Cake of the best quality.—Apply to MARK FOTHERGILL, 204 A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Clover Manure, per ton	£11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

WARMING.

HOT-WATER APPARATUS, with improved Boilers, requiring no brickwork, and arranged to continue in action from 12 to 16 hours without attention, adapted for Churches, Chapels, Conservatories, and every description of Building, supplied and erected on the most reasonable terms.

Also the THERMANTERION, an apparatus which warms without injuring the air, and recommends itself on account of its simplicity, durability, efficiency, and economy, especially adapted for Churches, Chapels, Halls, or Buildings, only used occasionally. — Apply to SPILLER and TAYLER, Engineers, Battersea.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of

THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

DROITWICH UNION.

SCHOOLMASTER AND SCHOOLMISTRESS WANTED.—NOTICE is hereby Given, that the Guardians of Droitwich Union will, on WEDNESDAY, the 16th day of October next, at their Board Meeting, proceed to the Election of a SCHOOLMASTER and SCHOOLMISTRESS, for the Droitwich Union Workhouse School. Candidates must not be less than 25 years of age, and will be expected to be not only competent to instruct the children in the elements of those branches of learning which are taught in the school, but also to be thoroughly versed in the principles of industrial training, as approved and recommended by the Committee of Council on Education, and practically acquainted with the mode of inculcating the same. The parties appointed must be able to pass the examination of her Majesty's Inspector of Schools, and the Election will be subject to the approval of the Poor-law Board.

Salaries proportioned to the competency of the teachers elected, which will be tested by examination, will be given of not less than 35*l.* per annum, together with such rations as the house affords, and washing, for the Schoolmaster; and of not less than 25*l.* per annum, together with such rations as the house affords, and washing, for the Schoolmistress, if respectively duly qualified.

Candidates are requested to send in, free of expense, their applications in their own handwriting, with Testimonials addressed to "The Clerk to the Guardians of the Droitwich Union, Droitwich," and superscribed "Application for the Office of Schoolmaster," or "Schoolmistress" (as the case may be) on or before Tuesday, the 15th day of October next.

No applicant need attend before the Board unless officially written to for that purpose.

By order of the Board. HENRY BEARCROFT.

Board Room, September 25.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY.

"Do you bruise the Oats you give your horses?" "No."

"Then you lose one bushel out of every three, and your cattle do not half so well."

MARY WEDLAKE AND CO.'S OAT-BRUISING MILLS. Superior Chaff Engines, simple in construction, doing from 50 to 500 bushels daily, and more. Almost all brewers and coachmasters in London use these implements.

118, Fenchurch-street, London. A pamphlet on the above, by sending 12 postage stamps. Chaff-cutters, Linseed, Bean, and Malt Mills.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 12, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS

THURSDAY, Oct. 17—Agricultural Imp. Society of Ireland.
THURSDAY, — 24—Agricultural Imp. Society of Ireland.

THAT farmers are seldom travellers, and that travellers, properly so-called, are as seldom well-informed in agricultural matters, must surely be the reason why we know so little of the farming capabilities of the various countries of Europe. This ignorance is to be regretted, as we are persuaded that if possessed of more correct information respecting foreign agriculture, there would be less alarm in the minds of farmers respecting their prospects, than at present unhappily prevails. To make good this assertion we will briefly give the description of Russian agriculture as we received it from an intelligent Russian gentleman, himself a farmer, near Riga, and who has lately visited England for the purpose of inspecting our farming operations.

In the immediate neighbourhood of Riga, Clover is generally grown between a crop of Rye and Oats, but further into the country Clover and rotations are alike unknown. White crops are taken one after another until the land is tired; and we were informed that this wretched system may be regarded as a not overdrawn picture of Russian farming. In the duchy of Courland, adjoining Riga, there is a great extent of land so poor that it is not enough to lay the land down to Grass to bring it round—it is actually left for 15 or 20 years, or until it is covered with brushwood, which is stubbed up and burnt. The land will then yield two or three crops of corn, and is again abandoned to brushwood.

Turnip crops are grown but sparingly, and the great objection to Potatoes is, that as they are not ready to be removed until the end of September, the season for sowing Rye is lost. No kind of out-door work can be done in the winter, as the snow will often lie 5 or 6 feet deep for weeks. The consequence of this is, that all animals, sheep not excepted, must be kept in the house the whole winter. And as for housing the corn it is only in early situations that a small portion of the crop can be got into the barns. The rest is set up 12 sheaves together, and allowed to remain in the fields. Threshing is kept going as vigorously as possible, and as soon as the small portion secured at harvest is threshed out another lot is dug from beneath the snow, dried by artificial heat, and threshed immediately. Another portion is then got in from the fields, dried in the same way, and threshed. In this way the month of January is often spent before the whole is secured. It will be easily imagined in what sort of a condition the grain will be, after such treatment, and what nice fodder the straw will make.

Labour is cheaper than with us, farm labourers receiving about 12*l.* per annum; but as our informant said that he was obliged to employ 15 men on a two-hundred acre farm, which five English labourers might have managed after *their* fashion, the English farmer may be almost said to have the advantage even here.

It is unnecessary for us to point out the superior social position an Englishman occupies, but we think it ought to still some of the murmurs in which our labourers sometimes indulge to be told that all the interior of Russia is cultivated by serfs or slaves, over whom their master has almost unlimited power. These serfs cultivate the estates of their owners, and in general receive no wages, but are allowed to work two days in the week for themselves. A male serf is worth 120*l.*, a woman rather less. Very little Wheat is grown except in southern Russia, and the only market at which it can be sold to any extent is Odessa, on the Black Sea. To this place the corn is carried in bullock carts over a country nearly destitute of roads, for upwards of 200 miles. Just fancy the farmers of Northumberland or Devonshire being obliged to carry the produce of their farms to London for sale. The carts which the Russian employs for bringing his corn to Odessa are home made, and put together without any iron in wheels, axles, or any part about them. When the seaport is reached, corn, bullocks, and cart are all sold, and the farmer walks home again; his journey of 200 miles to the market town occupying 8 or 10 weeks.

It is not our intention to undervalue the difficulties, either past or prospective, under which the English farmer may suffer, but it may be well to tell him that his brethren in other parts of the world have, in some respects, still greater difficulties to contend with.

It is very much to be desired that more correct information could be obtained respecting the agriculture of Europe than we at present possess. Such information would be both valuable and interesting. The late French Government published one or two works on the subject—properly qualified individuals having been employed to report on the agriculture of Germany and the adjoining countries. Our Government is a source to which we are so little accustomed to look for assistance in such matters that we can only recommend it to the serious consideration of our agricultural societies. There could be no reason why a prize offered for such a subject should not be open to foreigners as well as Englishmen.

As this is the season when farmers purchase ARTIFICIAL MANURES for top-dressing autumn-sown corn, it may be well to reiterate the caution we have often urged respecting what they buy in the name of guano. It appears, from a newspaper paragraph, that at least *double* the quantity of the guano imported has been *sold*. This is a very serious picture of the extent to which adulteration must be carried, and supplies a very intelligible reason for the bad crops of Turnips occasionally seen. For the loss caused by adulteration is not to be estimated by the difference between the money paid and the actual value of the article bought; we must take into account the far more serious loss of crop which has arisen from its use.

We have remarked, on previous occasions, that farmers have themselves most to blame in the matter; they prefer the so-called guano at 7*l.* to the genuine at 10*l.* If they would consider for a moment they might easily ascertain the almost certainty that the low priced article is much the more costly of the two. The Peruvian guano, from the hands of the agents of the Peruvian Government, is the only article that can be depended on, and as the price this season has been 10*l.*, the *stuff* sold at 7*l.* may be almost anything the consciences of the parties selling it will allow them to make it. Having once begun to adulterate with sand, chalk, and such like, it is difficult to judge of the compost to which genuine guano will be converted in its passage from the higher to the lower price. But the evil would not be so serious as it is at present, were the whole of the low priced guano derived from the Peruvian. Patagonia supplies considerable quantities of a very inferior guano, which can easily be purchased at

prices varying from 5*l.* and upwards; and it holds out other inducements besides its price to the manufacturer of cheap guano, namely, it is very wet, and is of a dark brown colour. A large quantity of dry rubbish can be added before it is of such a consistency as to be capable of application to the land, and its dark brown colour disguises such an amount of chalk as it would be impossible to add to the light-coloured Peruvian. It is from this Patagonian guano, then, that much of the trash sold under this name is derived.

Now, farmers may easily protect themselves, as we have often already told them. Let them deal with men of established character, and ask for the best article. Let them keep a sample of the article, attested by the dealer, and in the event of the crop exciting suspicion, a very simple and cheap chemical examination will afford an unerring guide to its real value; and will satisfactorily guide a jury in an action for damage, as has already been proved in many instances. As an example of the benefit to be derived from chemical analysis, Professor Anderson states, that out of 30 guanos which have passed under his eye, there were only nine whose purchase he would have recommended, the remaining 21 being "either very inferior or positively adulterated. This is bad enough; but it is easy to see that it does not give an accurate idea of the proportion of good and bad guano to be met with in commerce, as the possessor of an adulterated guano takes very good care to keep as clear of the chemist as he possibly can."

As far as has been ascertained, the top-dressing of autumn-sown corn ought always to contain as large a quantity of soluble phosphoric acid as possible, and some such substance as Rape-cake or *shoddy* (the refuse of woollen manufactures), both of which are capable of yielding ammonia by their decomposition. It would be advisable to apply this top-dressing at two different periods, say at the time of sowing, and again early in February, in order, as far as possible, to avoid the risk of loss from rain-water.

The yearly decrease of the supply of guano has led to the establishment of several very extensive manufactures for supplying a substitute, and we expect that at no very distant date the English farmer will derive from this source top-dressings and artificial manures suitable to the various crops. The use of bones prepared the way for guano, this prepared the farmer for using artificial manures, and if he can only obtain an honest article, it is impossible to estimate the extent to which they will be used.

TABLE OF COMPARATIVE VALUE OF MANURES.

		Water per cent.	Azote in 100 of matter.		Quality according to state.		Equivalent according to state.		Remarks.
			Dry.	Wet.	Dry.	Wet.	Dry.	Wet.	
1	Farm-yarm dung	79.3	1 95	0.41	100	100	100	100	Average of Bechelbron.
2	Dung from an inn yard (horse dung)	60.6	2.08	0.79	107	107	94	51	From south of France.
3	Dung-water	99.6	1.54	0.06	78	2	127	68	Washed out by rain.
4	Wheat straw	19.3	0.30	0.24	15	60	650	167	Fresh from Alsace.
5	Wheat stubble	5.3	0.43	0.41	22	102.5	453	98	
6	Oat straw	21.0	0.36	0.28	18	70	542	143	
7	Barley straw	11 0	0.26	0 23	13	57.5	750	174	} Of Alsace.
8	Pea straw	8 5	1.95	1.79	100	447.5	100	22	
9	Wheat chaff	7.6	0.94	0.85	48	212 5	207	47	
10	Withered leaves of Mangold Wurzel	88 9	4.50	0 50	230	125	43	80	
11	" " Carrots	70.9	2 90	0.85	150	202 5	66	47	
12	" " Potatoes	76.0	2 30	0.55	117	137.5	85	73	
13	Clover roots	9.7	1.77	1.61	90	402.5	110	25	Dried in the air.
14	Solid dung of the cow	85 9	2.3	0.32	117	80	84	125	
15	Urine of the cow	88.3	3 8	0.44	194	110	51	91	
16	Solid dung of the horse	75 3	2 21	0 55	113	137.5	88	73	
17	Urine of the horse	79.1	12 5	2.61	641	652.5	15.5	15 5	
18	Pigs' dung	81 4	3.37	0.63	173	157 3	58	63	
19	Sheep's dung	63 0	2.99	1.11	153	277.5	65	36	
20	Pigeons' dung	9.6	9.02	8.30	462	2075	21.5	5	
21	Urine of public vaults	96.0	17 56	16.83	900	4213	11	2¾	
22	Guano imported into England	19.6	6.2	5 0	323	1247	31.5	8.0	
23	Oilcake of Linseed	13.4	6.0	5 20	307	1300	33	8	
24	" Cole or Rape	10 5	5.5	4 92	282	1230	35	8	
25	Fresh bones	30 0	...	5.31	...	1326	...	7.5	
26	Woollen rags	11.3	20.26	17.98	1039	4495	9.5	2.5	
27	Coal soot	15.6	1.69	1 35	81	375.5	122	30	
28	Wood soot	5 5	1.31	1.15	67	287.5	149	35	

We may also judge of the value of manure by its tendency to ferment or decompose; and this tendency is in the following order, provided the animals have been receiving the same kind of azotised food (grains, roots, Linseed, or oilcake): first, the hog; second, the horse; third, the sheep; and fourth, the ox.

No chemical action, tending to the destruction of the material of which a living plant is composed, takes place during the life of the plant; external agents have no destructive effect upon them during this period; but as soon as the principle of life is gone, chemical action instantly takes place, producing decomposition, fermentation, putrefaction—a complete destruction of the form, and, at last, a "total disappearance, not a vestige being left to testify their former existence."

In this decomposition the woody part (carbon) loses its solid form; by uniting with the oxygen of the air becomes gaseous, forming, with the oxygen, carbonic acid gas, and is discharged into the atmosphere. As vegetable and animal matters, when they are decomposed, are converted either into a liquid or a gas, we should endeavour to prevent its escape out of, or beyond our power of applying it; we should, therefore, endeavour to direct the liquid so formed into a tank, bottling it up as it were for our use, and pour it over a heap of earthy compost or manure to make the mass ferment before it is used. The gas, as it escapes, should also have a something to detain it, or it will be lost to us. The ammoniacal salts, gaseous and liquid, of which these exhalations and filtrations consist have, however, great affinity for clayey earth, so that we can easily form a receiver of earth to hold it till we want to use it; this receiver is easiest made by bedding the dunghill and covering it over with earth before it ferments; the gas having a greater affinity for the earth, &c., than for the atmosphere, will thus take up its resting-place amongst it, so that we may have it in our power of raising it amongst the soil we cultivate.

The extractive matter in manure of any kind is the only part of it which is available to the growth of plants, hence the loss which the farmer sustains by letting the drainings of the court yard and feeding houses run to waste. All the urine from the feeding houses as well as from the stable, and the drainings from the yard, should be conducted to a cistern from whence it may be pumped upon the dunghill compost, midden, or on earth, which should be made near the cistern for this purpose.

The result of unrestrained chemical action in the dunghill is most evident. In the fermentation of the dunghill, when allowed to go on to the greatest extent, more than one-fourth of it is destroyed, being formed into carbonic acid gas, the residue being a carbonaceous matter in a very minute state of division, which may form a soluble compound with the oxygen of the air or with water; the blackness of the dung is owing to the carbon; the change, therefore, which takes place in the dungheap forms soluble substances—carbonic acid gas, carburetted hydrogen, and ammonia; part of these go off into the air and part into the stagnant pool, or runs to the brook.

Professor Kovite, from his experiments on manure at the Royal Academy at Morglin, in Prussia, found that fresh dung lost 26.7 per cent. in 81 days, 35.6 in 254 days, 37.5 in 384 days, 52.8 in 493 days; the loss is in a much greater proportion during the first stages of its decomposition than in the latter part of it. The dunghill may be termed the farmer's laboratory, in which he prepares the materials for the growth of his future crop, and his success as a farmer will mainly depend on the result produced in this laboratory; if he in this department of his business produces the articles which his crops require, and if they are properly applied, he may confidently anticipate an abundant return.

PHILOSOPHY OF THE DUNGHILL.—No. II.

(*Continued from page 635.*)

The most valuable matter is the animal excrements, and, as we have before stated, the relative value of animal excrements depends on the food which the animal consumes; that from straw-fed stock is very inferior in azote, while that from fattening stock (fed on roots, grain, Linseed, and oilcake) is rich in azote, and makes the most powerful manure. The straw of all the leguminous plants (Beans, Peas, and Vetches) are all highly azotised, and are most valuable articles either as food or as litter. Knowing the quantity of azote in the food and in the litter we use, we can approach near to the quantity of azote in the manure produced; see Table below. And taking this as our datum, we can get at the value of our manure.

All substances which contain azote have a great tendency to ferment. The vegetable substance which undergoes the most rapid decomposition has most azote in its composition; thus the leaves and residue of Cabbage, Mangold Wurzel, Swedes, Turnips, Carrots, and Potatoes, have azote in a high degree, and these undergo a rapid decomposition, giving out carbonic acid and hydrogen gas, and forming ammonia; moist straw decomposes very slowly, unless some substance containing azote be mixed with it, such as urine or liquid manure.

The following Table is an extract from Boussingault's "Rural Economy," p. 391:

We may also judge of the value of manure by its tendency to ferment or decompose; and this tendency is in the following order, provided the animals have been receiving the same kind of azotised food (grains, roots, Linseed, or oilcake): first, the hog; second, the horse; third, the sheep; and fourth, the ox.

No chemical action, tending to the destruction of the material of which a living plant is composed, takes place during the life of the plant; external agents have no destructive effect upon them during this period; but as soon as the principle of life is gone, chemical action instantly takes place, producing decomposition, fermentation, putrefaction—a complete destruction of the form, and, at last, a "total disappearance, not a vestige being left to testify their former existence."

In this decomposition the woody part (carbon) loses its solid form; by uniting with the oxygen of the air becomes gaseous, forming, with the oxygen, carbonic acid gas, and is discharged into the atmosphere. As vegetable and animal matters, when they are decomposed, are converted either into a liquid or a gas, we should endeavour to prevent its escape out of, or beyond our power of applying it; we should, therefore, endeavour to direct the liquid so formed into a tank, bottling it up as it were for our use, and pour it over a heap of earthy compost or manure to make the mass ferment before it is used. The gas, as it escapes, should also have a something to detain it, or it will be lost to us. The ammoniacal salts, gaseous and liquid, of which these exhalations and filtrations consist have, however, great affinity for clayey earth, so that we can easily form a receiver of earth to hold it till we want to use it; this receiver is easiest made by bedding the dunghill and covering it over with earth before it ferments; the gas having a greater affinity for the earth, &c., than for the atmosphere, will thus take up its resting-place amongst it, so that we may have it in our power of raising it amongst the soil we cultivate.

The extractive matter in manure of any kind is the only part of it which is available to the growth of plants, hence the loss which the farmer sustains by letting the drainings of the court yard and feeding houses run to waste. All the urine from the feeding houses as well as from the stable, and the drainings from the yard, should be conducted to a cistern from whence it may be pumped upon the dunghill compost, midden, or on earth, which should be made near the cistern for this purpose.

The result of unrestrained chemical action in the dunghill is most evident. In the fermentation of the dunghill, when allowed to go on to the greatest extent, more than one-fourth of it is destroyed, being formed into carbonic acid gas, the residue being a carbonaceous matter in a very minute state of division, which may form a soluble compound with the oxygen of the air or with water; the blackness of the dung is owing to the carbon; the change, therefore, which takes place in the dungheap forms soluble substances—carbonic acid gas, carburetted hydrogen, and ammonia; part of these go off into the air and part into the stagnant pool, or runs to the brook.

Professor Kovite, from his experiments on manure at the Royal Academy at Morglin, in Prussia, found that fresh dung lost 26.7 per cent. in 81 days, 35.6 in 254 days, 37.5 in 384 days, 52.8 in 493 days; the loss is in a much greater proportion during the first stages of its decomposition than in the latter part of it. The dunghill may be termed the farmer's laboratory, in which he prepares the materials for the growth of his future crop, and his success as a farmer will mainly depend on the result produced in this laboratory; if he in this department of his business produces the articles which his crops require, and if they are properly applied, he may confidently anticipate an abundant return.

Animal excrement undergoing an entire decomposition loses 1½ per cent. of its azote, and 9-10ths of its weight; therefore the sensible fermentation must be stopped before it gets to such a degree as to discharge its azote and reduce its weight. As the dung of the hog, the horse, and the sheep rapidly ferments, the best means to prevent loss from them is to bed the compost dunghill and cover it over with some earthy matter, and by carting over the compost hill to firm it, and thus prevent its rapid fermentation.

The ground on which the dunghill or compost midden is prepared should be level, and the materials of which it is to be composed should be regularly carted over it, so as to spread that which tends rapidly to ferment under a covering of earth or other matter, which does not rapidly ferment. The bottom of this permanent place for preparing the manure must be impervious, to prevent the liquid from sinking into the ground; it must therefore run into an open receiver on the two sides of the heap, so that it can at all times be scooped out and thrown upon the heap at very little expense. Earthy matter can be thrown down about these two receivers and mixed with the liquid, and then spread over the surface of the dungheap; every different kind of dung or other matter should be spread regularly and equally over the whole surface, and the carting over the surface will consolidate the mass and prevent violent fermentation; this and the repeated application of the liquid will keep it moist, and the carting over it will keep it firm, and the air being excluded from it fermentation will, to a great degree, be prevented.

About a month before we require to use the manure it should be carefully turned over, shaking out the dung and mixing the earthy matter well, and making the whole as loose and light as if we were to make a Cucumber bed of it; this will generate a sensible fermentation, which can, however, be regulated by the application of liquid from the reservoir, or by the application of earth or salt, which will imbibe the volatile matter that may be formed during this process. We must bear in mind that the outside of the heap ferments more readily than the middle of it, as it has a more ready access to the air.

The dunghill may be any thickness when we are merely storing it, accumulating the mass, and wishing to prevent fermentation; indeed the thicker it is the less will it ferment; but when we turn it over with a view of getting it to ferment to such a degree as we wish, then it must be only of a certain thickness—not more than 3 feet, as the air cannot pass through more than this depth to give it oxygen to set it fermenting.

The dung or exerements of animals should, if possible, be protected from the rain or weather; there should be a covered shed over the dunghill or compost midden, so as to enable us to regulate the state of its fermentation, and preserve the decoction of it from running to waste. *J. M.*

(*To be continued.*)

Home Correspondence.

Dung-heap Covers.—In compliance with the request of your correspondent "T. W. T." (and many others who have written to me), that I should, through the medium of your columns, publish some practical particulars respecting my mode of roofing middens, their size, &c. &c., for the information of the farming community, I beg to say I shall have much pleasure in so doing, desirous as I am, that every agriculturist, whether tenant or landlord, should benefit by plans from which I have myself received such practical beneficial advantage; whilst, at the same time, I would not advise any person partially to adopt them, unless he is prepared fully to carry them out in their entirety. I have at present two roofed midden steads (others in preparation), one is at the lower extremity of a parallelogram yard; on one side of this yard are cow-houses, on the other a straw house, threshing machine, and cart sheds; the midden, as said, is at the bottom of the yard, and at right angles with it; it is 56 feet long, and 22 feet wide, and is inclosed by a water-tight wall, 13 feet high at the lower side and both ends. The gable of the cow-house incloses part of the upper side, or that next the yard, the rest of this side is open to the yard, for the admission and abstraction of the manure. It has four raised roofs thus ΛΛΛΛ resting on the wall, and against the gable of the cow-house; having a zinc gutter in each valley, to carry off the rain water. The roofs are composed of the necessary wooden rafters, which are sheathed with three-quarter inch boards, and over this M'Neill's felt, which, when nailed on with half-inch tacks, receives two good coats of boiled coal tar, mixed with a sufficient quantity of red ochre, to give it a brown colour. The bottom of the midden stead is dished, and water tight, with an inclination to the liquid manure tank, at the lower end of the midden. The other roofed midden stead stands in the centre of an adjoining parallelogram yard. At the upper end of this yard stands the outer shed of the threshing machine. The two sides and lower end are slated sheds, for fat cattle and young stock, opening into the yard. This midden stead, as said, stands in the centre of the yard, with a cart road round it; it is 48 feet long, and 20 wide. It is walled 4 feet high from the surface of the yard on both sides, and one end; the other end is open for taking away the manure. On the cross of this wall are cast-iron pillars 6 feet high, sup-

porting a double oblong roof of the same materials as the other, with a zinc gutter in the valley, and all round the eaves, to carry off the rain water. All the buildings surrounding the yards are also guttered at the eaves for the same purpose. The bottom of this midden stead is also dished, and water tight, inclining likewise to the same tank as the other. In the tank is a hand pump, the nozzle of which is at a sufficient elevation to deliver the liquid on the surface of the manure in each midden, which is done every Saturday, or oftener, by means of leaden pipes, fixed into a trough at the nozzle of the pump. The litter from the stables and milch cow houses is daily deposited in the midden steads, and the urine is conveyed to the tank, by means of tiled drains, and also the urine, soap-suds &c., from the farm servant's cottages. In addition to this, the Grass mowings of the lawn, which the cattle will not eat, the clippings and scourings of the hedges and ditches, ashes, sawdust, and in short every kind of rubbish, is layered on the heaps, which are never disturbed until the manure is required for use. Our fat cattle are never tied up in the sheds, and which are not pitted; the manure in them only removed when it becomes inconveniently high. Our grazing cattle have the advantage of sheltering sheds in the fields, to protect them in winter from the inclemency of the weather, and in summer from a burning sun and tormenting flies; and from them, which are regularly littered, we procure good manure. The stack-yard has a permanent roof of the same materials as the middens, supported by cast-iron pillars, the corn recumbent on a timber frame work, placed on capped stone pillars, to prevent the access of vermin. My manure tanks are capacious, and were sunk 15 years since, when little, if anything, was said of the efficacy of tanks. I only wish they were at a lower elevation, in order to admit of the midden steads and cattle sheds being also sunk lower. Although I consider the processes I have endeavoured to detail are in advance of anything I have either seen or heard of, I am still very far from thinking they are not capable of amelioration—so much are agricultural improvements yet in the rear of other operations, which do not so vitally concern the public weal. *James Robertson Walker, Gilgarran, Whitehaven, October* 1.

Chloride of Lime a Prevention for Smut in Wheat.—I beg to send you, for the information of the numerous class of readers of the *Gazette*, an account of an experiment lately instituted at the Botanic Gardens of the Royal Dublin Society, for the purpose of ascertaining the value of chloride of lime, first proposed by me as a prevention of smut in Wheat. From some microscopic examination of the two kinds of smut with which our grain crops are liable to be attacked, and from the bleaching properties of chloride of lime, coupled with its alkalinity and deodorising power, I was induced to believe that this substance would be peculiarly efficacious as a dressing for Wheat, and other corn seed, previous to its being sown—an expectation which, I am happy to say, experiment has fully justified. In last spring I procured 4 lbs. of very fine white Wheat seed, 1 lb. of which I laid aside, not having subjected it to any preparatory process. The remaining 3 lbs. I then mixed intimately with a large quantity of smut or bunt—the sporidia of the Uredo caries—in sufficient quantity to colour the entire a light brown. This I divided into three equal parts, which, with the preceding parcel of clean seed, made four parcels of 1 lb. each. One pound of the infected seed I then steeped for two hours in a saturated solution of chloride of lime, and, after pouring off the solution, sifted some fine sand over it to dry it, and thus render it easily sown. The mixed portion of the infected seed I treated in the manner so strongly recommended by the French commissioners, viz., steeping the seed for two hours in a saturated solution of sulphate of soda, and drying with quicklime sifted over it. The third parcel of infected seed was not subjected to any further treatment. The four parcels of seed were then, on the 8th of March last, sown in four similar plots of ground; they all appeared above ground on the 1st of April, and, the crop being fully ripe, it was cut on the 5th September. The result of the experiment, which was apparent even while the crop was standing, I beg leave now to lay before you:—Plot No. 1, sown with 1 lb. of clean, undressed Wheat seed; No. 2, 1 lb. of infected seed steeped in solution of chloride of lime; No. 3, 1 lb. of infected seed steeped in solution of sulphate of soda, and dried with quicklime; and No. 4, 1 lb. of infected seed, undressed. One pound of the ears of the produce of each plot, cut close off, was counted, and the number of the sound and smutted ears recorded. In the same manner the number of straws in 1 lb., deprived of the ears, was ascertained. The following are the numbers of each:

Plot.	Total No. of Ears in 1 lb.	No. of Sound Ears in 1 lb.	No. of Smutted Ears in 1 lb.	No. of Straws in 1 lb.
No. 1.	336	336	—	234
No. 2.	364	362	2	268
No. 3.	632	352	220	278
No. 4.	702	362	340	380

Among the numerous deductions which the foregoing estimation warrants, one is quite obvious — that the chloride of lime dressing is far more efficacious, as a preventive of smut or bunt in Wheat, than the dressing so highly recommended by the French commissioners, insuring not only the grain from the attacks of the fungus, but preventing the deterioration of the straw which this Uredo appears also to occasion. I purpose next year to repeat this experiment, with a view to determine not only the efficacy of the chloride of lime compared with the dressings in common use, but to test its power in destroying that other pest of our cereal crops—the Uredo segetum. *W. Edward Steele, M.D., 15, Hatch-street, Dublin.*

Ought Farm-yard Manure to be decomposed before led to the Field?—"We may be allowed to express our surprise that such a question should have been raised in the present day, and still more that the affirmative answer should have been disputed by agriculturists of distinguished merit." (Boussingault.) The great diversity of opinion that still exists on this important subject may now, for the most part, be traced to the want of experience, or to the injudicious application of the dung at a time when its beneficial effects are impeded by known causes. I find my statement, in a late number of the *Gazette*, has been assailed, and, indeed, ridiculed by Mr. W. E. Gill, and powerfully upheld by "J. D." in the following page. I beg to inform your former correspondent that my remarks are fully corroborated by extended observation and experience on thoroughdrained land. I will admit that by a proper preservation of our farm-yard manure, and by fermentation—by permitting it to decompose under cover, and by adding to it from time to time those substances that fix the ammonia, we get the richest manure ever at the farmer's command. "But recent manure loses weight by lying in the farm-yard. The moisture evaporates, and volatile matters escape by fermentation. By the time that the straw is half rotten, this loss amounts to one-fourth of the whole weight, while the bulk is diminished one-half. If allowed to lie still longer the loss increases, till at length it may approach to one-half of the whole, leaving a weight of dung little greater than that of the food and straw which have been consumed. The weight of common mixed farm-yard dung, therefore, obtained from 10 cwt. of dry food and straw, at different periods, may be thus stated approximately: 10 cwt. of dry food and straw yield of recent dung, 23 to 25 cwt.; at the end of six weeks, 21 cwt.; after eight weeks, 20 cwt.; when half rotten, 15 to 17 cwt.; when fully rotten, 10 to 13 cwt. These quantities are supposed to be obtained in the common open farm-yards, with the ordinary slow process of fermentation." (Johnston's Lectures.) This loss is one great drawback to the present method of decomposing our dung in the open yards. We may easily check the volatility of the ammonia, but a great waste of the soluble parts of our dung cannot without difficulty be prevented. The food of the plant must become soluble before it can enter the spongeolets of the roots. To attain this end fermentation is necessary, therefore it must be sufficiently accelerated to supply the requirements of the crop. The tenacious supersaturated clay, on which your correspondent delights to dwell, would, in all probability, impede the decomposition of the dung, and so counteract its beneficial effects. Experience has fully proved that the decomposition of good unfermented farm-yard dung will progress enough speedily, in well-drained clay soils, to support the demand of the plants; and by the aid of its mechanical action will supersede dung in any other state. Here we are following Nature's laws, the infallibility of which we dare not doubt. It is so ordered that the constituents of which our plants are composed shall be slowly liberated, to support the growing demand of the plants, that nothing may be lost. With fresh as with other dung it will be most efficacious to the crop for which it is applied when led on at a proper season. No definite rules can easily be laid down as an unerring guide in this difficult part of farming practice. But this I may safely say—for those plants that have a speedy growth and early maturity, it is necessary that the decomposition of the dung in the soil should have progressed sufficiently to yield a ready supply of food to the growing plant. I wish it to be understood that the manure which I am here advocating is not that strawy material your correspondent would have us believe, but contains an abundance of phosphates, and a large supply of nitrogen in the shape of urea, uric acid, mucus, &c., which by their speedy decomposition will yield ammonia to the plants. "Care must be taken to bury it well in the furrow, when the dung will of itself ferment and communicate its heat to the soil, whilst the straw will render it light and penetrable to the gases engendered. By means of the ammonia which it produces, it acts strongly upon the insoluble mould which these soils often contain, and produces several effects, of which one of the principal is to bring into action the nutritious portions of the soil which it before contained, and which decomposed manure produces in but a very imperfect degree. On the other hand, little benefit and sometimes even inconvenience is derived from undecomposed manure on light poor lands, which contain but little moisture, and consequently require all that could be communicated to them by the manure." (Von Thaer.) Theory and experience alike demonstrates that the most economical, expedient, and profitable way of applying dung to thorough drained viscous clay land, is in an unfermented state. *George Summers, Stoke Wake, Dorset.*

Flax.—In what publications can I get the best account of the culture and after management and preparation of Flax, where both seed and fibre are objects to be attended to? The Flax Improvement Society of Ireland have introduced many improvements, have they not? Do their publications give a full account of the best process; and where are they to be had, and who is the Secretary of the the Society? In Loudon's Agriculture, he says, "Of late an invention has been made by Lee, of Middlesex, by which, with the aid of soft soap and machinery, the fibre is more completely separated than by steeping, and uninjured by that process. When Flax is to be separated by this new process, the cultivator has only to pull it in handfuls, dry it, bind it into sheaves or faggots, and put it up in stacks like corn till wanted by the manufacturer;" and in the next page, "Lee's method of breaking Flax and hemp without dew retting was invented in 1810, and was the first step towards a great improvement br ought nearer perfection by the new patent machines of Messrs. Hill and Bundy," and he gives a figure of the machine (1825 edition). Is, then, steeping dispensed with in the most approved management of Flax, and are these machines in use? *J. F.* [Schenk's method of steeping Flax, in which warm water is used, and the process effected in 50 to 60 hours is, the likeliest improvement upon the old plan. All requisite information will be had on application to the secretary, directing to J. M'Adam, jun., Esq., at Belfast. A visit to Belfast would be the likeliest method of gaining information.]

Clay Lands.—The fallowing of lands was very extensively followed by the ancients, in order to refresh and recruit the land by a year's rest, after it had carried crops for a certain time. It has been practised in our island from time immemorial, and at this day it forms the foundation of all profitable agriculture. On the description of lands not fitted for green crops, there are not wanting many theoretical, and some very eminent practical men, who contend that fallows may be abolished altogether; but they only show their ignorance, and evince their total unacquaintance with the stubborn soils that require that operation. No mode of cultivation yet discovered can supersede the necessity of the pulverisation and cleaning effected by fallowing, or reduce the soils at the proper time to a fit state for any plant known to us, except by a summer's working. It may be deferred or omitted, in one course of cropping, by the substitution of leguminous or half cleansing, or smothering crops. But it must again recur, and often with little benefit obtained by omission, especially in the case of the poorer and more stubborn clays. Frequent draining has been mentioned as likely to effect a radical change in clay soils, and to fit them for green crops; but the total subtraction of water may destroy the viscous tenacity necessary for crops, especially to Wheat and Beans. And any case of alteration yet effected may have arisen from a new constitutional alliance of the soil, or from the clay approximating to loam. The conversion of Wheat clay lands, properly so called, into green crop soils, even of the most difficult kind, is yet a problem in which are given all the modes and means known to us to produce a green crop, or any other crop, with equal general advantages to the land and to the cultivator. Much, or most of the aversion entertained against the summer fallowing of land, by prejudiced and hasty observers, arises from the unskilful and slovenly manner in which it is often performed. There is a most painful difference, certainly, between a well cleaned and thriving green crop, and a summer fallow of clods and weeds. But the same degree of skill that produced the former is able, with the same attention, to remove the latter; and there is not, in the whole course of modern cultivation, a more pleasing sight than a well-formed summer fallow in the end of the season, the impossibility of producing a crop upon it being always understood. But no farmer who knows his business will incur the loss or reproach of bad fallowing of land, and thus throw the blame on the system instead of the performance. A very considerable part of the clay land in England is lying in ridges of a crooked serpentine form, of unequal breadths at the ends, and often terminate in a point in the middle of the field. The working of the land in consequence becomes very awkward, and many attempts have been made to straighten the ridges—and in some cases successfully, from the ridges not being very crooked or very high; but in very many cases, with great damage, from the contrary circumstances of height and shape. By reason of long continued gathering of the ridges in the olden mode of cultivation, the subsoil is convex as well as the upper soil, and when the newly-made ridges took a crossing or slanting direction over these convexities, the water lodged in the hollows, and reduced the full half of the land to a state of mortar. Much loss was in many cases sustained, and the failures had the usual effect of deterring other attempts where the same obstacles did not exist. It has been recommended to make a complete alteration at once, by a levelling with the spade, removing the too high subsoil to the lower places, and then replacing the top soil. But this expense would in many cases exceed the value of the land, and has been little used. Where the ridges are not very high and very crooked the performance is easily effected by the plough and the harrow filling up the hollow places; and, in extreme cases, a very safe method consists in making with the plough a narrow ridge of 4 or 5 feet in breadth in the old deep furrows, and increasing it in width every following course of fallowing, till it rises and fills the hollows, and levels the high ridges, when new ridges may be drawn as nearly as possible in the direction of the old ones, and then the water will obtain a gradual flow. This method may be reckoned slow, but it is the safest and the most economical yet practised, being wholly done by the common plough. *D.*

New Wheat Drill: gluten a specific mark of Wheat, &c.—I thank you for giving publicity to the account I sent you of my drill, as it will in part answer several inquiries made to me concerning it, although I did not write sufficiently explicit to satisfy the whole. The drill

is 84 inches wide from wheel to wheel, and it requires on stiff land two horses, but on light land one horse will do very well, or in other words it is worked like the common drills in use. My invention is machinery which drops the grains of seed one by one in the rows as the drill moves on, or it will drop more than one as required; but unlike my thin-seeding friend, Mr. Mechi, who drops, 10, 15, and even 20 grains in one place, my drill, when worked for me, drops but one seed at a time, and nothing shall induce me to put in more, and by which means on an average I drill almost a peck an acre of Wheat and Barley, or if I aimed at great accuracy, so as to obtain an extraordinary crop of Wheat, I should put in about six quarts of seed. I know you prefer six pecks, that is, 48 quarts an acre; and a speaker at Mechi's gathering said he required at least 96 quarts. I hope free-trade will annihilate this waste, and I think education joined to free trade will accomplish this desirable object in a few years. Around *me* the delusion is vanishing away fast: I have reduced the seed with many, full a bushel an acre. The more I read and reflect upon your last the more it puzzles me. For more than 30 years have I applied my mind to the subject that it treats of, during which time I have conversed with many persons. I have read many authorities, I have made as many experiments as my humble means and abilities would enable me, and seen as many; and I have at farmers' clubs and Literary and Mechanics' institutions delivered lectures, and all have proved to my mind that the quantity of gluten in Wheat is a specific mark of Wheat; and that it is so I stake my reputation against Sir G. Mackenzie's and Mr. Lawes's "facts" to the contrary. I have in our union workhouse and in my parish for the last 10 or 12 years made observations and experiments on the food for infants, and the *facts* I have obtained are so convincing to me that I have had serious thoughts of drawing the attention of the poor-law board and the Government to them. They are completely against your authorities. I will give you two recent cases in our own parish, or within the last year; two women had infants, and one of them had no milk, and one was ordered by the parish surgeon not to suckle her infant she being in a bad state of health, through poverty. I saw the infants, neither of which was astrong child. I asked the mothers to feed them as I directed, and one of them, whose child was very weak and sickly, consented, but the other refused, saying that she gave it beautifully white bread, and if it were the will of the Lord that the child should die I could not save it. The last funeral I had was that poor infant's. The other child is now as fat and healthy as any child in my parish. Life and death here therefore, I am satisfied, depended chiefly on the difference of the bread the two infants were fed with: and I could give you many other examples; in fact, you have my permission to publish what I now state, namely, that in poor houses thousands of children perish annually, not from bad nursing so much as from not having given to them a sufficiency of gluten in their food. The same rule, also, refers to labourers; give them bread full of gluten and they will be strong and healthy, but not otherwise: modern bread is worthless. Nor are Sir. G. Mackenzie and Mr. Lawes more correct in reference to the *kinds* of Wheat. I stake my reputation that different kinds of Wheat grown in the same field side by side will possess different quantities of gluten in them. You have my permission to publish this also. I am sure all *scientific* men will likewise agree with me here. I have proved it over and over again, and can prove it now with three kinds of Wheat grown side by side this last year. *G. Wilkins.* [We did not deny that Wheat was distinguished among other grain by containing a large proportion of gluten—but we did deny that Egyptian Wheat or any other "species" of Wheat could be distinguished from among the others by comparing its proportion of gluten with that of the others. The proportion of gluten is not a "specific" mark of Wheats. They differ in this particular not according to species so much as according to circumstances of growth.]

Productiveness of the Peruvian Barley.—I dibbled this year one peck in an acre of ground; the produce has been 22 bushels, the weight per bushel is 64lbs.—the bread made from it is superior to that of common Barley bread, and not darker than some of the red Wheats would yield, after the bran has been removed. In flavour and appearance it might be mistaken for dark Wheaten bread. Do you think that if the Peruvian Barley had been sown thicker, or broadcast, it would have produced a larger crop? Twenty-two bushels an *acre* is a small produce, although it may appear a tolerable yield, from the small quantity of seed sown. The seed was dibbled about six inches apart, two or three grains in a hole. The land in which it was sown was tolerably strong land, immediately adjoining the Peruvian Barley; in the same field I sowed less than a bushel of black Barley; it produced at the rate of 60 bushels per acre, but the bread made from it is very dark. *X. Y.*

The Pasture near my house is completely overrun with, I have no doubt, the cockchafer—or Melolontha vulgaris. These insects appear to be in their second or third year, as far as I can understand from a book describing and delineating the several stages of their existence. There are spots in the field where, what with the grubs and the birds who banquet upon them, the Grass is entirely killed; and on moving the withered blades, considerable numbers of these animalculæ present themselves; and turn up the sward where you will, in apparently the healthiest parts, they appear to be almost as numerous. Three of my most intelligent farmers know not what advice to give me, besides claying and cropping. A writer, whose work I accidentally possess, informs me that the most effectual means discovered of destroying my enemies, some 20 years ago, were attacking them in muck heaps, &c., and catching them on the wing. I am, as you may suppose, anxious to know if some more practicable preventive of their depredations may not have been devised by later naturalists suitable to my case. *K.*

Railways.—I perceive in this month's "Civil Engineer's Journal," an extract from the *Agricultural Gazette* on Farm Buildings, wherein an allusion is made to the application of railways and machinery. That you may know agriculturists are looking in the right direction, I beg to inform you I am just completing an entire new steading at Lymm, Cheshire, for Thomas Ridgway, Esq., where all you have stated respecting railways for agricultural purposes is carried out. In this instance, a railway is formed at the back of the barns and a range of buildings, the stacks standing on frames, as usual, over a double line of rails. There is a frame on wheels placed on the outside of the barn, which holds corn in the straw; this is threshed out, first being thrown direct into the feeding board of the threshing machine. When the frame is relieved of its load, it is run under the other frames, which are wedged up—the wedges are knocked away and the fixed frame with its load rests upon the one on wheels; to this is attached a rope from the steam engine, and the stack is bodily moved to the feeding board. The stacks are placed under skeleton sheds, thus securing the grain from wet, when being harvested—saving the expense of thatching—the loss of grain by removal—the expense of carting from the stacks to the barn, and there unloading into the bay of the barn; also the expense of removal from the bay to the machine. It is calculated that on the outlay for the sheds and rails a per centage of 10 per cent. is obtained, after making the proper allowances for wear and tear. The security from weather during harvest is moreover obtained, which is a most important consideration in such a wet county as Cheshire. Railways are laid through the bullock sheds, and the food supplied direct from trucks, one man feeding 70 or 80 bullocks in about an hour. The principle of the threshing machine is original; it is small, compact, and effective. The steam engine is applied for a multiplicity of purposes, and pumping the water into a tank above forming the roof of the engine shed. A sufficient fall is obtained to supply the whole of the premises, house, &c. In the dairy it produces a fountain in summer—in winter, warm water is supplied in pipes to the dairy, and to a whole range of poultry houses—in the latter for inducing early incubation; it is also carried by similar means round a shed used for sprouting Potatoes, by which means the Potatoes are taken to market three weeks earlier than they would be by the common process. This is a long established fact in Cheshire, even by the process of sprouting by a primitive process common in the county. The grinding of Beans, bruising of Oats, cutting of chaff, &c., is carried on in a room over the barn and adjoining the granary, and when the food is required for the cattle it is mixed in this room and let fall through a trap into a truck and conveyed direct to the cattle sheds. *G. A. Dean, Agricultural Architect and Engineer.*

Societies.

North Lancashire, *Sept.* 11: *The Economy of Preparing and Applying Farm-yard Manures, especially in a liquid form.*

Mr. W. J. Garnett said: The reason why the Council of the Society selected this subject was that they considered it a very important one—very important to practical men, and very important to scientific men, to take into their consideration, and also to enable them by their experiments and examination of the matter, to lay it before practical men, for them to make the most of it, to perfect it, and to carry it out on their own farms. Now, in the consideration of this subject the Council had thought it a very important one, inasmuch as it was not only important in its results to agriculturists, but there was a great diversity of opinion prevailing, among all classes of farmers, as to the best modes of preserving and keeping farm-yard manure, and the best modes of using it and laying it on the ground. Some maintained that the solid part was better laid under cover, while others maintained that it was better in the open air. Some maintained with regard to the liquid that it should be used early, while others maintained that it should be kept some time in tanks before being used. There was also a diversity of opinion as to the most economical mode of laying it upon the ground, and all these questions raised so many questions for practical men to consider, that the Council thought they could not bring before the notice of the Society generally any better subject for discussion than this—relating to the manures of the farm both in a liquid and in a solid state. He was in hopes, for one, that the discussion which would take place that day would not be confined entirely to the economy of farm-yard manure, but that it would be extended to the several modes of preparing and making use of liquid manure and the manure of towns. He had a notion himself that there was an immense fund of fertilising properties in these manures now allowed to run to waste in the sewage of towns, and which they and the cleverest men in the land were at their wit's end to know what to do with. He could not help thinking that there was some mode of converting these manures, which are now nothing but a nuisance through the length and breadth of the land, to the benefit of the farmer.—Professor Way said he would first of all come to the question, What is farm-yard manure? Now supposing they had a native forest of trees—in the west of America, for instance—they had them growing year after year, shedding their leaves annually, and the soil growing over them; and it did not require much logic to find out that these trees, which had first begun with saplings, must have increased enormously till they formed the immense amount of timber which was to be found in these forests. That a great amount of the subsistence of these trees came from the air was quite manifest, for without its aid the soil could not furnish the immense amount of timber found in these forests. In ordinary agriculture they planted seeds, the seeds came into plants, and by and by they had a crop, which crop they took off the land to the farmstead. Supposing the crop to be a Turnip crop, then that crop was consumed in the farm-yard, and at the same time a certain amount of manure and a certain amount of beef and mutton was produced. The beef and mutton were taken off the farm and sold at the market, and they could not doubt that the quantity of manure by which the beef and mutton were produced was maintained; so that a large proportion of the substance which produced plants was never carried away to the market, but went out in the shape of manure. Obviously, in practical agriculture, the object was to return all that to the soil which had not been used in the production of beef and mutton. They ought to divide their crops—supposing, for instance, a Turnip crop—into two, namely, that which produced the beef and mutton and that which produced a second crop. The economy of manure was to add everything to the soil which had not been used in the production of meat. Now in the use of the different substances which came off the field where the Turnips were grown, and which were not for the production of meat, they were not able always to return the manure immediately to the soil; and the question was, how it could be preserved with the least charge. There were two or three forms of feeding which were now questions of dispute. There was the old system of farm-yard feeding, where the manure was exposed to the rain, and where every shower which came down from the heavens washed through the farm-yard, carrying off the black liquid to a neighbouring pond. Then, there were the covered yards, in which the cattle were penned, but not tied up; and there was the box-feeding system, where the cattle were fed on certain pieces of ground in which their manure was deposited, and which, with layers of straw, was made into compact, solid manure. This practice—namely, the practice of box-feeding—was not much prevalent in this county, but was an exceedingly good practice, and turned out to good advantage in some counties in England, especially in Norfolk, where, as they would know, the farming was very good. He should like, before the proceedings terminated, to hear some gentlemen express their opinions as to whether manures should be fermented or not fermented, as that comprised the whole of the question of box feeding. The question was, whether the manure should be exposed to the rain or not, and whether the liquid manure should be applied as such, or incorporated with solid manure so as to carry it more easily to the field. He should be very happy, as he had said before, to answer any questions which might be put to him, and he believed that that was the best mode of eliciting information. He would not detain them further on this point, than by saying that every exposure of the manure to the air—every fermentation of manure, caused loss. The nuisance which they smelled from the dung-heap, or the sewers in towns, was just as much an indication of loss to the farmer, as it was of loss of health to the residents of the town or farm-yard. There could be no such thing as smell without a loss of matter, and that matter was the most valuable manure that could be lost by the farmers. Our noses were proper criterions for the loss of manure, as, in proportion as we had strong smells, so in proportion was the farmer losing his manure. They would see, then, that the fermentation of manures was always attended with a loss of valuable fertilising matter, and the only question therefore was, whether the advantage of highly fertilised manures, in the rapid production of root crops—particularly of Turnips, which came rapidly into play—the only question was, whether that did not more than counterbalance the loss. The question was, the laying down of 10 loads of fermented manure, with a speedy crop, against 10 loads of unfermented manure and a later crop; and not 10 loads of fermented manure against 10 loads of unfermented manure. Till the mechanical means of applying liquid manure to the soil was better understood and brought into greater perfection, they could not expect that the use of the liquid would be much extended. It was very well known that upon heavy lands the manure, by being carried in carts, if of any weight, did some injury to the land by the wheels of the carts and the horses' feet trampling down the soil. He would now beg to be allowed to call attention to an experiment which he had brought with him, which involved a great deal; but he was afraid that at present they would not be able quite to understand it. The tube which was fixed beneath him was a glass tube, simply with a pipe at the bottom. Into this tube a quantity of soil was placed—what the soil was he did not know, because he himself had not produced it; but it was an exceedingly fine soil, because it took some time for the liquid which was placed at the top to penetrate it. The object of this experiment was to show that when strong liquid manure from the stable or the cow-yard passed through soil, and was allowed to filter from it, that liquid would no longer be manure, but would be principally water. Those things which gave the smell and the colour to the manure would be retained in the soil—showing the adaptation of the soil to unite with the component parts of the manure, and the liquid will pass out perfectly clear. It was certainly a fact that they might filter the nasty looking liquid through the soil, and the soil would be endued through its retaining qualities with the whole of the noxious ingredients of the manure. What he would point out in this was, that in the use of liquid manures there was no reason why they should be limited to particular seasons of the year. It had been generally considered that to apply liquid manure with any chance of success we must apply it to a crop of Italian Rye-grass, Clover, or something of that kind; but his belief was, that if they threw the liquid manure on the soil the rains or drains would not carry away the matter (which really was the producing quality), but virtually that would be left upon the soil, so that they might lay by a store for any plant in the soil at any time of the year, and there would be no kind of loss. (Applause.) Thus they might throw a liquid manure upon the soil any time that might suit their own convenience. He thought that this fact would make a change in the use of liquid manure, and would lead to its more extensive application. In feeding in the winter, the quantity of this kind of manure produced was very great, and unless the tank was very large it would be impossible for them to deal with it. If, however, his axiom were correct, that the soil had the power of making use of the solid materials of the liquid manure, no matter what time of the year they put it upon the land—but of course using the judgment necessary in the putting of it on, so that it would not be done at a time when it would absolutely injure the land in its mechanical texture—if his axiom were correct, they might put it on at any time, and the soil would receive the benefit. He had published a paper lately in the Journal of the Royal Agricultural Society of England, showing that no matter what time the manure was applied to the soil, the results would be the same, and the animal matter necessary to the production of the crop—the salts of ammonia, the salts of potash and magnesia, and all that which they considered valuable as manure, were retained by the soil, and the water was filtered away. If they put in this manure a quantity of the salts of ammonia or guano, they would find that the liquid would run away entirely free from these compounds. He should like any of the gentlemen present to give their experience as to the use of liquid manure, and particularly to direct their attention to any cases where liquid manure had been applied to the soil instead of being applied to the crop.—Mr. E. G. Melling, of Preston, read the following paper: The following remarks are intended to apply to the general character of the farms in the district comprehended by this Society, which are mostly small holdings as compared with other counties in England, and the occupants of which would scarcely be justified in incurring the expense of force [pumps, hose, and other costly materials which modern science has introduced. The arrangement of most of the old farm steadings is very inconvenient for the retention of liquid manure, and, in consequence, a great expense is involved in putting down tanks and the requisite drains. In erecting new buildings, care should be taken to avoid this. If the site of the steading is on undulating ground, much advantage may be

taken of the circumstance by placing the tank in such a situation that no pump will be required. A pipe or drain, with a tap, should run from the bottom of the tank and come out at some lower level, where a cart could stand for the purpose of being filled; or canvas hose might be attached to irrigate the field in which the drain may terminate. By this means a large proportion of time and labour would be saved; the expense of keeping pumps in repair avoided; and the more solid deposits at the bottom of the tank would be carried away at the same time. As to the best method of constructing the tank, very few specific recommendations can be given—the nature of the substratum, situation, and other circumstances, preventing the adoption of anything like a uniform plan. In my experience I have always found that the best crop was grown with the strongest liquid, and in no instance has it been necessary to dilute it with water; therefore care should be taken to make the tanks perfectly water-tight, for on this the success of the whole system depends. If clay be at hand, the bottom, top, and sides, should all be puddled; but if clay cannot be got, the whole of the inside should be cemented. The drain pipes should also be cemented or puddled; in short, every endeavour should be made to exclude water both from the tank and its connections. The mouth of the drain receiving the liquid from the shippon or stable should be guarded with a grating, to prevent the ingress of straws; and immediately underneath should be a chamber in which the liquid might temporarily lodge, and deposit any solid matter that might be washed in with it, before passing on to the tank. This chamber should be regularly cleaned out when full, which can easily be done by raising the grate. A little attention to this will prevent the large tank from being filled with matter that cannot be pumped out. The size of the tank must be regulated by the number of stock kept upon the farm. I consider it useless to apply liquid manure during the frosty months of November, December, January, and February; and for this reason the tank should be made sufficiently large to contain four months' produce at once. According to a calculation I have made, and which I believe will be found near enough for practical purposes, one cow during that time will make 300 gallons; therefore the size of tank required will be—

	Gallons.	Cubic measure. Ft.	In.	Cost. £	s.	d.
For 1 Cow	300	3	7⅕.....	1	19	0
5 „	1500	6	3	5	16	10
10 „	3000	7	10	8	9	1
15 „	4500	9	0	11	11	8
20 „	6000	9	10½.....	13	3	8

We now come to consider the best time for the application of liquid manure, and the different crops upon which it is most advantageously used. On Grass land at no time of the year has it so great an effect upon vegetation as in the months of March and April, when Nature is making her first efforts to throw off her winter garb. Every means should be used to store up as much as possible for this important time. For young Grass seeds liquid manure stands unrivalled, when judiciously applied, bringing them into early maturity at a time of the year when other food is becoming scarce. It enabled me this year to commence cutting the first crop of Italian Rye-grass and Clover on the 25th of April, although the spring was very late, the land heavy clay, and only partially drained; the second on the 5th of July; and the third on the 27th of August. The total length of the Grass cut was 7 feet. Part of the field I tried with night-soil; but it was not near so good a crop as that to which liquid had been applied. The latter was carried on twice, before and after the first crop was taken off, at the rate of 14 tons per acre each time. This may appear a large quantity, but the land was very poor, and my intention was to improve it. If the land had been thoroughly drained, and in a position to do full justice to the manure, I have no doubt half the quantity would have been sufficient. If the manure is of full strength when applied, a little more care is necessary. A dull, damp day should be chosen, and the land should not be trampled on after being dressed. On old meadow land and pasture it also answers well. The former will be ready for cutting a fortnight or three weeks sooner than if manured with the best farm-yard manure. And the latter the cattle eat with avidity, showing a great partiality for the Grass grown with this manure. On the Turnip crop it may be used in various ways. If the weather is very dry (like the last spring) at the time of sowing, after the manure is spread in the drills, run the drag over it, cover up immediately, then sow, and the plants will come up healthy and strong, bidding defiance to insects, let the weather be ever so dry. On the management of farm-yard manure much has been said, and I am not aware that I can advance anything new. To save the best and richest portion, the manure should be protected by being covered in. The different kinds should be evenly spread over the surface of the midden, so that the heating nature of the horse-dung may be counteracted by that of the cow. When turned, it will then become thoroughly incorporated. A covered middenstead in the hands of a sloven will be a greater evil than the present system. The manure will be spoiled from over-heating, and will become fire-fanged, if not actually in a blaze. By the addition of a layer of sand or earth this may be avoided, and the valuable ammonia retained. Notwithstanding the pretensions of the various artificial manures recently introduced, we must always look to the farm-yard for the only grand specific for restoring to a poor field that health of which the unskilful hand of man may have robbed it. In this way the enterprising tenant will be partly enabled to meet low prices, by having at home the means of growing the greatest amount of produce at the least possible expense.

(*To be continued.*)

Farm Memoranda.

Small Farm.—A letter from Miss Martineau to the Master of the Guiltcross Workhouse has been published, describing the result of a plan of cultivation and cow-keeping originally suggested to her by him, by means of which she has been enabled to maintain two cows on about an acre and a quarter of land. Miss Martineau sets out an account of the difficulty and expense of procuring butter, cream, eggs, ham, bacon, fowls, &c., at her residence at Ambleside, and of the ridicule created by her attempt to raise articles of this sort on her little bit of ground, by the aid of a labourer and his wife despatched from Norfolk. She then proceeds as follows: "In planning the turning up of my ground for spade cultivation, I went on the supposition of keeping only one cow; and for seven months we kept only one. But I considered the inconvenience of the cow being dry for three months out of the 12; and that there was room in the stable for a second, and little more trouble in keeping two than one; and a pretty certain market among my neighbours for whatever butter and milk I might have to sell. So I bought a 'spring calver,' and we find that we very nearly maintain them both on little more than three-quarters of an acre of Grass, and less than half an acre of garden. The second cow pays her way by her manure and milk. Our first consideration was the manure. It is as true with relation to our smaller concerns as to a greater, that 'the more manure, the more green crops—the more green crops the more stock, the more stock the more manure.' There are two tanks, well flagged and cemented, well closed, so that not a drop can ooze out. One is connected with the house, and the other with the cottage and cow-house, receiving all their drainage of every kind. A barrel on wheels stands at the back door to receive all the slops, soap-suds, cabbage-water, &c., and this liquid manure is wheeled away, and applied where it is wanted. There is a compost pit at the back of the kitchen garden; and a compost heap behind some young trees at the bottom of the field. What with the clippings, and weedings, and sweepings, and nothing being wasted, the pit being kept clean, and the cow-house swept twice a day, we have abundance of manure (without buying any whatever), which accounts for the abundance of our crops thus far. One instance of my servant's passion for economy amused me so much that it seems worth telling you. Early one morning, returning from my walk, I looked in upon the pig, just when his breakfast was approaching in another direction. I said to Robert, 'I think piggy looks very well, only that he wants a washing.' 'Yes, ma'am,' said Robert, 'that will be to-morrow. To morrow is washing day, and the suds will wash the pig first, and then be as good, and better, for manure; and then the soap serves three times over.' Our available ground is of pasture, 3 roods 28 perches; and of tilled ground, 1 rood 15 perches. There are, besides, about 26 perches of Grass in the little plantation, orchard, and slope, which yield some fresh Grass when mowed in summer. I shall turn up a little more ground this spring, in order to provide completely for the maintenance of two cows, though I cannot encroach much more upon the Grass, on account of the views from the windows. But for this we should give our cows no Grass or hay, which are the most expensive kinds of food. Our soil is good; neither very rich nor very light; lying at varying depths upon limestone. Much of our newly-dug portion was full of stones. Our neighbours advise us to cover them up again, but we judged differently. I thought we might as well make drains of the new pathways we must have; so, by deep digging, we obtained drains, and the large stones were thus disposed of. Some more were carted out to mend the roads, and when my servant was in despair at there being yet more, it occurred to him to dig out good earth from corners of the plantation and supply its place with stones. He actually dug pits breast deep for the purpose. His digging for crops was not less than two spits deep, dug straight down, and the whole was richly manured. The ground being ready, our method is this:—In August we sow Cabbage seed, and by the end of September we begin to set out the young plants, about 400 per week, for six weeks, to secure a succession. We set them in rows, the plants being 11 inches apart, and the rows a yard apart. In March and April we sow Swedes and Beets in alternate rows, between the rows of Cabbages. By the time we begin to cut the Cabbages, the Turnips and Beets are past the danger of the fly, and may be thinned—the removal of the Cabbages letting in air and sunshine. We also keep a portion of ground for Belgian Carrots, which afford excellent cow food. We succeeded less with these this year than with our other crops, from their not being sufficiently thinned. But we had 25 stone of them, and four or five carrots per day were very acceptable to the cows. By the end of March the cows can get a bite in the pasture, and the mowings of Grass in the orchard, &c., are brought to them fresh. While the pasture is shut up for hay the Cabbages begin to ripen. They weigh from 4 lbs. to 12 lbs., and each cow eats about 18 per day. This is their food from June to November, with such grazing as they get after our hay-making, and a handful or two per day of Indian meal, scalded and given with their Grass. The pasture having been well manured in the winter and wonderfully retrieved by good care, yielded more than a ton and a half of the finest hay. This year, I think, I shall try for a second crop, as we have abundance of manure. But last year I had half the pasture hurdled off, and the cows let out for some time every fine day to graze, the one half for one fortnight, and the other the next. By the time Grass and Cabbages were done, we had laid in less than we hope to produce this year, but a fair amount of crops—for the cows 1½ ton of hay, 25 stone of Belgian Carrots, and at least 10 cwt. of Swedes and Beet. We laid out too much of our ground for household vegetables, having had a surplus after the following supply:—Fine green Peas—from the 12th of June till the middle of September; Peas, Lettuces, Radishes, Spinach, Turnips and Carrots, and Onions, enough for the whole winter; 5 or 6 stone of early Potatoes, Vegetable Marrow, a few Cucumbers, abundance of Cauliflowers, Broccoli and Cabbages, and plenty of Rhubarb and Gooseberries. A Strawberry bed is laid out, too, and we are to have plenty of Apples and Pears and Cherries and Damsons hereafter. We used enough green vegetables for a family of five persons for the whole summer and autumn. The average yield of the cows is about 10 quarts per day each, *i.e.*, about 4 lbs. of butter per week. The skimmed milk is eagerly bought, being as good as I used to buy for new milk. The butter-milk improves our bread and cakes very much, and the pig has what we do not use. The cows give 16 quarts per day for some time after calving, and are dry about three months before. One cow calved in October, and we sold the calf (a cow calf) for a guinea at the end of a fortnight. The same cow is to calve again in September, and the other in May, and thus a continued supply of milk is provided for. We kill two pigs in a year, and selling half each time, get our hams and as much bacon as we want for little or nothing. What we have to buy is three barrels of Indian meal in a year (at an average of 16*s.* each), some of which we use ourselves for puddings and cakes, and which goes far towards feeding the fowls; a few trusses of Wheat-straw after harvest (when it is cheapest), to chop and mix with the cows' boiled Turnip food in winter, a few pennyworths of grains per week, and two or three loads of Turnips after Midsummer, and perhaps a little (but very little) hay. As I consider that the cows maintain the man, this expenditure is all that I have to make in return for our large supply of vegetables, pork, bacon and hams, eggs, and a few fowls, our gardening and the keeping of the whole ground in high order, and, moreover, through the good nature of my excellent servant, our window cleaning and coal-shifting. The cow-house is, as I said, swept out (into the entrance of the tank) twice a day; and it is whitewashed twice a year. The cows are rubbed down daily, and kept almost as sleek as horses. Both are now in much finer condition than when they came. They were rather restless for a few weeks, after first coming from the fell; but they seem now perfectly happy, and when out in the field they return to the stable of their own accord to avoid rains, heat, or flies. Their food in winter is each a stone of Turnips three times a day; the Turnips being shred, and boiled with chopped Wheat-straw, a little hay, a handful of salt, and a double handful of Indian meal, or somewhat more of bran. They may have, beside, to amuse themselves with, a few raw Turnips, and two or three handfuls of hay per day."

Miscellaneous.

Grand Cattle Show at Modbury.—There will be a fine show of cattle at Modbury, on the 15th day of November next, when upwards of 80*l.* will be awarded as prizes; and, in addition, we understand that Mr. William E. Rendle, the Seed Merchant of Plymouth, heads the list with a silver cup, value 5*l.* It will be altogether a noble show, and we anticipate a great gathering of the yeomen of the West.

Notices to Correspondents.

Asphalte: *W B M F.* Take 5 or 6 bushels of broken flints, about ½ inch size. If 5 bushels, add 1 bushel of gravel stones, all the dirt carefully sifted out; spread on a wooden board with side ledges, pour gas tar on little by little, turning over the stones with a shovel until every stone is wet with tar, but leaving no surplus tar. It cannot be too often turned. Add 1 bushel sharp sand, or enough to make the mixture of the consistence of thick pudding, turning it over as before. Lime may be mixed with the sand if thoroughly slaked and powdered, but not otherwise. The ground on which the mixture it to be laid should be carefully levelled; then lay on the mixture from 3 to 6 inches thick; spread a little sand over it, to prevent it sticking to the roller, and roll it down with a heavy iron roller. Where tar may ooze up to the surface, spread a little sand to absorb it. If too much sand is used, or any not wetted by tar, a hole is the consequence. It should not be used for a month, and should be rolled every day until hard. It is impenetrable, and costs at most 1*s.* per yard square, tar being 6*s.* or 7*s.* per barrel of 15 gallons, and broken flints 1½*d.* or 2*d.* per bushel. *J. P. B.*

Beans, &c.: *Rector.* The winter Bean may be drilled or dibbled now. Your 34 acres of good Grass land might keep a dairy of 12 cows, besides rearing three or four young beasts and a few pigs. One man should do all the work.

Boarding, &c.: *J H S. For Bullocks*: The boards must be 4 inches wide, 2½ inches thick, 2 inch openings. *For Sheep and Pigs:* 3 inches wide, 1½ inch thick, 1½ inch openings. Cross pieces to which the planks are nailed about 2 feet apart. The planks may be rather thinner and narrower, but my experience tells me they are better as above; because there is a great strain with heavy bullocks. I have at present, on boards, 60 calves (1½ inch openings), 30 bullocks, 150 pigs, 100 sheep. There is no mistake about the success of the operation; of course, as in all modes, there are some drawbacks. Oak or hard wood is preferable to Fir. I find immense advantage from cooking the fine cut straw, with a little hay and meal, giving it hot to the animals—more of this anon. The time will come when straw will be appreciated as food. *J. Mechi.*

Bog Drains: *K V R.* You had better be satisfied to do the thing slowly. Let the deep main drains be frequent, and let the land lie for a couple of years, and thereafter put in the cross drains, with collared pipe tiles, 4 or 5 feet deep, and you may fill up with broken stones to within 30 inches of the surface, more for the purpose of getting rid of the stones than for anything else. After draining plough it or dig it up in ridge, chopping it well; apply as much earthy compost over it as you can; and sow Rape broadcast over it.

Drains: *W M H* asks, "What is the smallest regular inclination at which a tile pipe drain has been laid and found to keep itself clear; either with or without a constant stream of water running through it?"

Egyptian Wheat: *Recent Subscriber.* Rev. G. Wilkins, Wix, near Manningtree, Essex.

Grasses: *D.* Too late for this week; meanwhile we may say all that is necessary is, that your *seedsman* should be able to recognise the sorts by the names we gave; and, no doubt he can.

Grass: *E D.* Guano is better than superphosphate for top dressing Grass land in spring. That is, containing a greater number of things, it is most likely to contain those which your land wants. It is to be had genuine by purchasing of the importers, or inquiring of them.—Black Barley is spoken highly of. We would prefer the Chevalier. Stubble Turnips after Barley or any other grain crop are rarely of much value. The heaviest and best green crop you can get after corn stubble is Rye, sown immediately, and cut in April and May following.

Kohl Rabi: *Sussex.* It is very hardy, and will stand the frost better than the Turnip.

Lime: *W M H.* We should prefer lime at 4*d.* to 5*d.* a bushel to chalk at 6*s.* a ton, both on the ground.

Marl *versus* Chalk: *W M H.* Your question does not admit of an answer, because it is not the carbonate of lime alone which is useful. Supposing the rest to be useless, or only so far useful as to balance the extra expense of the extra bulk of material. Thus it is easy to see that an equal value of marl must contain 25 per cent. of carbonate of lime to be equally efficient with pure chalk—supposing the former to be delivered on the ground at one-fourth of the price. Cherry marl is not always preferred to that which is whiter, and appears to contain a larger proportion of carbonate of lime.

Oilcake: *G E* wants to know how he may best use it in feeding pigs. It will not make good bacon. Break it down and

soak it. It will fall abroad in the water, and may be given as bran is, along with the wash.

Poultry: *Thorpe.* Your case is an unpromising one. The fowls are doubtless half blind, and must be crammed to keep them alive, and their heads washed with warm water, containing some astringent, say green tea. Rue, either in a decoction or the green leaves, may be administered internally. The disease is not a new or rare one. We *guess* there is something wrong about your fowl-house. See that it is wind and water tight, and have it *thoroughly* white-washed—floor, perches, nests, wall, ceiling, and everything. None of the poultry books are expensive. Buy two or three, and compare their merits.—*R.* Chickens between three weeks and a month old, must, in October, be expected to be liable to sneezing and gasping. If the autumn continues fine, you may rear them with attention, warm housing, and high feeding. We can recommend no better treatment. It would have been wiser to give the hen duck's eggs when you allowed her to sit so late in the season. *D.*

Seed Wheat. We are willing to vouch for any truth belonging to the practice of farming, whether published in our advertising columns or not, that comes within the scope of our personal knowledge; and we have no hesitation in recommending Mr. Beman's varieties of Wheat this day advertised. Mr. Beman occupies a large extent of well farmed land in North Gloucestershire, and has long paid particular attention to the subject of seed Wheat; and we so far know the varieties named, especially the white one, as to be confident in their excellence as seed.

Spade Labour: *Inquirer.* You may read O. O. Roberts on Agricultural Economy as the Antidote to Agricultural Distress, and Mr. Yule's pamphlet on Spade Husbandry, published in Dublin.

Steaming Apparatus: *S F.* One of the best steaming apparatus is that manufactured by Richmond, of Salford. It is of various prices. Apply to him. We see in the Exeter Implement Catalogue the names of H. Carson, Warminster; W. C. Cambridge, Langton Iron-works; Cathay, Bristol, and many others (you should get the Catalogue); any of whom could probably make a cheap and efficient steamer.

Weight of Sheep: *W A, Newport.* The carcass weight of a well-fed two-year-old wether sheep, that now weighs, fasting, 250 lbs., would be probably 32 to 34 lbs. a quarter.

Winter Beans: *Cox.* There is nothing in the *latitude* of Yorkshire to injure them, but the *altitude* of many a place in that county may unfit it. They are hardly so productive in general as spring Beans, but ripen earlier, and in that way are superior in many obvious respects. Sow now or any time this month 6 pecks per acre, in rows 2 feet apart.

Markets.

COVENT GARDEN, Oct. 12.

Vegetables are abundantly supplied, and Hothouse Grapes and Pine-apples are plentiful, especially the former. Peaches are less abundant. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent. Filberts are dearer. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are good and cheap. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce, as are also French Beans. Cut Flowers consist of Heaths, Pelargoniums, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosissima, Japan Lilies, and Roses.

FRUITS.

Pine-apples, per lb., 3s to 5s
Grapes, hothouse, p. lb., 1s to 3s

HOPS.—Friday, Oct. 11.

Messrs. Pattenden and Smith report that the demand continues good for all new Hops, at late prices. Duty 220,000*l.* to 225,000*l.*

SMITHFIELD, Monday, Oct. 7.

The supply of Beasts is large; notwithstanding there is a brisk trade for the best descriptions, and nearly 4s. is reached in a few instances. There are a few more Sheep; trade is active at about the rates of Monday last. The demand for Calves is small, and it is exceedingly difficult to maintain Friday's quotations. From Holland and Germany we have 678 Beasts, 4250 Sheep, 143 Calves, and 290 Pigs; from Scotland, 10 Beasts; and 3100 from the northern and midland counties.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c. ...	3	8 to 3	10

Calves	2	4 —	3	8
Pigs	3	0 —	4	4

Beasts, 4261; Sheep and Lambs, 27,340; Calves, 253; Pigs, 540.

Friday, Oct. 11.

The number of Sheep is large, but choice qualities are scarce, and consequently dearer. Second-rate sell slowly at about Monday's prices. The supply of Sheep is considerable for the time of year. Trade is dull and Monday's quotations are with difficulty maintained. A few choice Calves make 3s. 8d., but other kinds are sold very low. From Holland and Germany there are 411 Beasts, 1490 Sheep, 169 Calves, and 10 Pigs; 400 Beasts from the northern and midland counties; and 82 Milch Cows from the home counties.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c. ...	3	8 to 4	0

Beasts, 1089; Sheep and Lambs, 6900; Calves, 370; Pigs, 510

MARK LANE.

Monday, Oct. 7.—The supply of English Wheat at market this morning, by land carriage samples from the near counties, was smaller than of late, and the quality and condition decidedly inferior to that of the preceding week. Selected parcels realised the rates of Monday last, but quotations must be reduced 1s. to 2s. per qr. for secondary and inferior qualities. In foreign Wheat a limited amount of business was transacted, at rates barely 1s. lower than those current on this day se'nnight. Choice qualities of malting Barley being scarce, such readily command full prices; but in some instances other descriptions declined 1s. per qr. Old foreign Barley was taken off in retail for grinding purposes, at former prices. Although the receipts of Oats from abroad during the week have been upon a less liberal scale than of late, it was found impossible to establish any advance; really good old horse corn was saleable at the extreme quotations of Monday last; but although the light and inferior new Irish were offered on easier terms, they found no favour with the dealers. Beans and maple Peas fully supported previous rates. White English Peas did not bring so much money, most of the samples being unfit for the splitters' use.

Friday, Oct. 11.—The arrivals of Wheat since Monday have been small, and moderate of all other articles. This morning's market was fairly attended, and there appeared an increased disposition on the part of the millers to purchase foreign Wheat and Flour, but the firmness of holders rendered the transactions limited. English remains unaltered in value.—Spring corn of all descriptions is firm, with the exception of secondary English Barley, which is very unsaleable.—Business in floating cargoes is not active, and rather lower prices have been submitted to.—The Wheat trade has continued depressed during the past week throughout the kingdom, and a further decline, varying from 1s. to 2s. per qr. is pretty general. In a few of the inland markets held yesterday and on Wednesday increased firmness was observable, and previous prices were fully maintained. Flour has participated in the depression to the extent of 6d. to 1s. per sack upon foreign and country marks. Spring corn generally has supported its former value. Koningsburg, 5th: White Wheat has declined 1s. to 2s. per qr., red 6d. to 1s.; supplies of spring corn small; Peas, 26s., f.o.b. Dantzic, 5th: Factors being disinclined to submit to the reduction required by purchasers, little business has been done.

Arrivals this week.

Liverpool, Friday, Oct. 4.—During the last three days the receipts of Irish produce into this port have been very inconsiderable, and we have none coastwise for insertion to-day. Though we have few buyers at our Corn Exchange this morning, and only a moderate business passing in any description of Wheat, there is a decided return to greater firmness; we therefore repeat the full prices of Tuesday for all foreign Wheats, and in some instances a small advance is practicable upon the reduced currency recently accepted ex-ship; new Irish Wheats, on the contrary still tend a little downwards. There continues a good demand for Indian Corn to export to Ireland, up to 28s. for yellow American, of which few parcels remain on offer; prime white has become very scarce, is much inquired for, and would bring an advance.——Tuesday, Oct. 8, —At our Corn Exchange this morning English and foreign Wheat was held with unabated firmness at the currency of this day se'nnight, which have been very reluctantly complied with on the part of buyers. Although in Barley, Beans, and Peas little business was apparent, prices remained unvaried. Malt, upon a moderate demand, was steady in value. Oats merely sustained the rates of Tuesday last. The present prices are: Wheat, English red, per 70 lbs., 5s. 6d. to 6s. 0d.; white, 6s 0d. to 6s. 3d. Barley, Scotch and Irish, per 60 lbs., 2s. 10d, to 3s. 2d. Malt, English, per qr. pale, 49s. to 55s. Oats, English and Scotch, per 45 lbs., 2s. 9d. to 3s. 0d. Beans, English, per qr., 28s. to 32s. Peas, do. do., 31s. to 33s.

SHEET GLASS.

JAMES PHILLIPS and Co., 116, Bishopsgate-street-without, beg to inform Nurserymen and others, that they have on sale about 10,000 Feet of SHEET GLASS of various sizes, 16 ounces to the foot, at 12s. 6d. per box of 100 feet. Box charged, but full price allowed when returned.

GLASS FOR CONSERVATORIES, GREENHOUSES, FRAMES, &c.

JAMES PHILLIPS and Co. are supplying SHEET GLASS, 16 ounces to the foot, in boxes of 100 feet each, at the following prices for cash:

Sizes. Inches.					Inches.			Per foot.	Per 100 feet.	
					Under 6	by 4	at	1½d.	is £0	12 6
From 6	,,	4	,,		7	,, 5	,,	2d.	,, 0	16 6

MILK PANS 2s. to 6s. each, Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2d. each; Cucumber Tubes, 1d. per inch; Peach Glasses, 10d. each; Wasp Traps, 3s. per dozen; Pastry Slabs, Glass Plates, in wooden frames, for butter and pastry, &c.; Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7s. 6d.; 6 tubes, 10s. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

THOMAS MILLINGTON, GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT, LONDON.

HATTON NURSERY, NEAR HOUNSLOW, MIDDLESEX.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

20,000 Scarlet and other Rhododendrons, 20,000 Ghent and other Azaleas, 2000 Andromedas, 6000 Kalmias, 2000 Hardy Heaths, 1000 Daphne Cneorum, 3000 Cedar of Lebanon, 1 to 4 feet, in pots, 300 Pæonia arborea; also a large quantity of Seedlings of sorts.

MESSRS. PROTHEROE AND MORRIS are directed, by the Executors of the late Mr. John Ronalds, to offer to an unreserved sale by Auction, on the premises, Hatton Nursery, near Hounslow, Middlesex, about 1½ mile from the Feltham Station, on MONDAY, October 14, and following day, at 11 o'clock, the whole of the valuable NURSERY STOCK, consisting of a large and rich assortment of American Plants, Evergreens, and Deciduous Shrubs, comprising Laurels, Irish Yews, Pinus of sorts; Spruce, Scotch, and Larch Firs; Lime, Alder, Ash, Plane, a large quantity of Quick, three fine specimens of Cedrus Deodara, 8 to 10 feet, &c.—May be viewed prior to the sale. Catalogues had (6d each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

A LARGE AND IMPORTANT SALE OF EVERGREENS.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. J. Smith to submit to an unreserved Sale by Auction, on the premises, Dalston Nursery, Middlesex, on THURSDAY, October 17th, and following day, at 12 o'clock precisely, the whole of the valuable EVERGREENS, comprising fine-grown plants of variegated Hollies, Aucuba, Box, Laurestinus, Laurels, Phillyreas, Scarlet Aubutus, Bay, Rhododendrons, Andromeda floribunda, Azaleas, Lilac, Ivies, Brooms, and Clematis in pots, together with the remaining Greenhouse Plants. May be viewed, and Catalogues had, one week prior to the sale (6d each, returnable to purchasers) on the premises; of the principal seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

BRENTFORD, MIDDLESEX.
To Noblemen, Gentlemen, Nurserymen, Market Gardeners, and Public Companies engaged in Planting.

MESSRS PROTHEROE AND MORRIS are directed, by the Executors of the late Mr. J. Ronalds, to submit to public competition by Auction, on the premises, the Butts and Toolands Nurseries, on MONDAY, October 21, and eight following days, at 11 for 12 o'clock precisely each day, in consequence of the number of Lots, without the slightest reservation, the whole of the valuable NURSERY STOCK, riding over 30 acres, which is particularly worthy the attention of Noblemen and Gentlemen laying out their Grounds, as well as the Trade, for its excellence, and comprise several thousand Fruit Trees of the leading and approved varieties, a large quantity of Forest Trees, Ornamental and Deciduous Shrubs, together with a rich assortment of Evergreens.—May be viewed prior to the sale, and Catalogues had, on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT TO SEEDSMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS have received instructions from the Assignees of Mr. CHARLES BUNYARD (a bankrupt), to offer to public competition, by Auction, on the premises (Nash and Hicks's Warehouse, Horsleydown), on THURSDAY, October 31, at 11 o'clock, the whole of the valuable SEEDS and IMPLEMENTS IN TRADE, viz., Sacks, Bags, Weights, Scales, and Measures; a capital Winnowing Machine, Nests of Seed Drawers, &c.—May be viewed, and Catalogues had of Wm. Whitmore, Esq., Official Assignee, Basinghall-street; of Messrs. Marten Thomas and Holland, Solicitors, Mincing-lane, London; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

JAVA ORCHIDS.

MR. J. C. STEVENS begs to announce that he has just received notice of the arrival of a consignment of most rare and valuable ORCHIDS, in perfect health, including the following choice species: Saccolabium Blumei majus, Vanda tricolor, Vanda suavis, Spathoglottis plicata, Cœlogynes, &c. A more detailed advertisement will appear in the next Number of this Paper, and the day of Sale announced.
38, King-street, Covent-garden, Oct. 12.

RARE AND NEW ORCHIDS FROM THE INTERIOR OF NEW GRENADA.
AN IMPORTATION DESERVING ATTENTION.

MR. J. C. STEVENS has the honour to announce that he will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on MONDAY, the 21st October, at 12 for 1 o'clock, an importation of Rare and Valuable ORCHIDS, just arrived by the last West Indian steamer. Collected in the interior of New Grenada, by Mr. Schlim, traveller to Mr. Linden. Amongst the many varieties contained in this collection may be mentioned, Uropedium Lindenii, the most extraordinary Orchid known, the flowers measuring from 24 to 30 inches in diameter; Odontoglossum hastilabium, and several new and brilliant species; Sobralia dichotoma, and four new species; Eriopsis rutidobulbon, with gigantic bulbs, the stems growing 2 feet high, covered with from 40 to 60 beautiful flowers; Cycnoches barbatum; a new and beautiful Myanthus; two new and pretty Houlletias; a new genus, bearing large and splendid flowers; another very remarkable new genus; Burlingtonia Granadensis; a new Trichopilia; an Angulos, with beautiful orange-coloured flowers; and several new Oncidiums, Stanhopeas, Warreas, Brassavolas, Mormodes, Epidendrums, &c., to which will be added several fine specimens of Anguloa Cloweaii and Ruckerii, Odontoglossum citrosmum var. roseum, Oncidium papilio majus, Epidendrum bicornutum, Cattleya Mossiæ, and many other favourite species.—May be viewed on the morning of sale and Catalogues had.

FULHAM ROAD.
TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR D. A. RAMSAY has been favoured with instructions from Mr. J. Shearman, to submit to public competition, on TUESDAY, October 15 and two following days, at 12 o'clock (his lease having expired), on the premises, near Queen's Elm, Fulham-road, Brompton, a portion of the valuable NURSERY STOCK, comprising Standard and Dwarf-trained Peaches, Nectarines, &c., a large quantity of fine Evergreens, Deciduous Shrubs, Ornamental Trees, &c. A choice assortment of Standard and Dwarf Roses, &c. May be viewed prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen; and of the Auctioneer, Brompton Nursery, Fulham-road, London.

ABSOLUTE SALE OF AMERICAN PLANTS, EVERGREENS, AND OTHER NURSERY STOCK.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton (one mile from Hyde-park Corner), on TUESDAY, October 29, and following day, at 12 o'clock, 2000 Scarlet and other Rhododendrons, Azaleas, Andromeda, Ledum, &c.; 1000 Standard, Dwarf, and Pillar Roses, Standard and Dwarf-trained Fruit-trees; 1000 Victoria and other Rhubarb Roots, Fig-trees, Strong Grape Vines; about 5000 Evergreens, 3000 Ornamental Trees, Deciduous Shrubs, &c.—May be viewed prior to Sale, and Catalogues had at the principal Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, London.

TO GENTLEMEN PLANTING.

MR. WILDE is instructed to Sell by Auction, on TUESDAY and WEDNESDAY, October 15th and 16th, all the fine and healthy Stock of FOREST TREES (the property of Mr. Bell, who is declining business), on his Nursery Grounds, adjoining the New Church, Lakenham. The Stock consists of Larch, Spanish Chestnut, Hazel, Scotch, True Highland Pine, Spruce, Silver, Ash, Beech, Elm, Birch, Oak, Holly, Yews, Common and Portugal Laurels, several hundred thousand Whitethorn, with a general assortment of Forest and Ornamental Trees. Catalogues will be ready five days prior to the Sale.

MR. J. J. FOSTER, of the Edgware Nurseries, will offer to public competition, at the London Auction Mart, Bartholomew-lane, on TUESDAY next, October 15, a quantity of Fruit Trees, fine Evergreens, Ornamental Shrubs, and some beautiful Stand ard and Dwarf Roses.—Catalogues to be had of the Auctioneer, Edgware; at 24, Mark-lane; and the Mart.

MR. HASLAM begs to inform the Public, that in consequence of the late arrival of the Ghent steamer, this week, the large consignment of CAMELLIAS, LILIUMS, &c., will not be Sold till FRIDAY, Oct. 18th, at the Auction Mart; at which time, also, will be sold a large quantity of Roses, Dutch Bulbs, &c.—Catalogues at the Mart, and South Essex Nurseries, Epping.

"VICTORIA NURSERY," NEW HILLINGDON, NEAR UXBRIDGE.

MR. H. MORTEN will sell by Auction, on the Premises, as above, on TUESDAY, WEDNESDAY, and THURSDAY, the 15th, 16th, and 17th of October, 1850, at 10 for 11 o'clock each day, by order of the Trustees, under a Deed of Assigoment for the benefit of the Creditors of Mr. William Bright, the VALUABLE NURSERY STOCK, comprising about 500 Wall-trained Apricot, Peach, Nectarine, Plum, Cherry, and Pear Trees; 1500 Stake-trained Dwarf and Standard Fruit Trees, 600 Standard Cherries, 600 Standard Roses, 300 Hemlock Spruce, 3300 Hollies, 1500 Common Laurels, 100 Standard Rhododendrons, 1000 Variegated Box, 90 very fine Cedars of Lebanon; 2000 yards of Box Edging, 200 very fine Portugal Laurels, 400 small ditto, 80 Scarlet Thorns, 850 Striped Hollies, 300 fine common Laurels, 1500 Laurustinus, 50 American Arbor-vitæ, 1000 Dwarf Rhododendrons, 200 China Arbor-vitæ and others, 150 Red Cedars, 100 Azaleas, 75 Large Yews, 800 common Yews, and a quantity of other Stock. The Stock can with confidence be recommended, being in very fine condition, and must be sold without the least reserve.

The LEASE of the substantial and convenient DWELLING HOUSE, with the Greenhouse, Forcing Pits, and Nursery Ground, will be offered for sale on the first day, previous to the sale of the stock.

May be viewed any time previous to the Sale (Sundays excepted).

Catalogues may be had (seven days prior to the Sale) on the Premises; of Messrs. RICHES and WOODBRIDGE, Solicitors, Uxbridge; and at the offices of the Auctioneer, Uxbridge, Middlesex.

HACKNEY.—TO NURSEYMEN AND OTHERS.

MR. LEREW will Sell by Auction, on the premises of the late Mr. R. STREET, Wells-street, Hackney, on TUESDAY, October 15, at 11 for 12 o'clock, without reserve, the valuable Stock in Trade of that old-established Nursery, comprising fine Aucubas, Laurels, Rhododendrons, Azaleas, Hollies, Laurustinus, Evergreens, Ivies, Shrubs, Fruit Trees, 7000 Greenhouse Plants, 42 large standing Pear Trees, Lights, Frames, and Glasses; Waggon, Carts, Chaise, Horses, Pony, &c.—To be viewed two days prior to the Sale, and Catalogues had, on the premises; of Mr. Street, 111, Goswell-road; and of the Auctioneer, 2, Cardington-street, Hampstead-road, near the Euston-square station.

CHERTSEY, SURREY.
TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. WATERER will sell by Auction, on MONDAY, October 28, and following day, at 11 o'clock, by order of the Proprietor, at Brox, about two miles from the town of Chertsey, and one mile from the Addestone Station, a valuable NURSERY STOCK, comprising 75,000 Fruit, Forest, and other Trees, Evergreen and other Shrubs, including Spruce and Larch Firs, Birch, Horse Chestnut, Turkey Oak and Holly, Common, Wood, and Portugal Laurels, Arbutus, Laurestinus and Laburnums, Standard, Dwarf, and Climbing Roses, Honeysuckles, Irish Ivy, Daphnes, Clematis and Aucubas, Pears, Peaches, Apricots, and Nectarines, Plum, Pear, and other Stocks, Rhododendrons, Azaleas, Kalmias, and other American Plants, Ornamental and other Flowering Shrubs, 800,000 Bedded and Seedling Quick, and other Stock, the whole of which are in a safe moving condition.—May be viewed one week previous to the sale, by applying to Mr. GEORGE GRAY, Brox; and Catalogues had on the premises, and of Mr. WATERER, Auctioneer, Land and Timber Surveyor, Chertsey, Surrey.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

SUNNINGDALE AMERICAN NURSERY, near Sunninghill, Berks, two miles from Virginia Water, two miles from Sunninghill Wells, and half a mile from Shrub's Hill.

MR. WATERER will Sell by Auction, on MONDAY, November 4, 1850, and following days, at 11 for 12 o'clock precisely, part of the extensive and valuable NURSERY STOCK of Mr. James Walker; consisting of 25,000 blooming Rhododendrons; Kalmias and Azaleas for Forcing, and many large ornamental Plants; a large quantity of Choice Evergreens and Flowering Shrubs, Dwarf Roses, and Honeysuckles, Standard and Dwarf-trained Apples, Pears, Cherries, Plums, Peaches, Apricots, and Nectarines, of the most approved sorts, Common and Portugal Laurels of all sizes, Birch, Ash, and Oak, Purple and Common Beech, Spruce, Larch, Scotch and Balm of Gilead Firs, of all sizes, a large quantity of Quick, from 3 to 5 years old, and a great variety of other Nursery Stock, well worth the attention of Nurserymen and others, about planting, being in a safe moving condition. N B.—The above is the produce of Seven Acres, and will be sold without reserve, as the Lease expires at Midsummer, 1851.—May be viewed one week previous to the Sale, and Catalogues had on the premises; of Mr. CHARLWOOD, Seedsman, Covent-garden; and of Mr. WATERER, Auctioneer, Chertsey, Surrey, who will forward them on application, by post, enclosing six postage-stamps.

NURSERY STOCK TO BE SOLD.

TO BE SOLD, a great Bargain, the STOCK OF A NURSERY, situate within three miles of one of the first seaports in the Kingdom, comprising a general collection of Fruit and Ornamental Trees, Evergreens, American Plants, &c., there being hardly any Forest Trees. Also Five Hot and Greenhouses, and their contents of choice plants; the whole Nursery occupying about 12½ acres. The Rental, with Dwelling House, &c., very light. The proprietor would leave most of the money on approved security, and will give most satisfactory reasons for disposing of the Stock.—Address J. H. W., *Gardeners' Chronicle* Office, with real name and address.

TO BE LET, and entered on immediately, BECKLEY NURSERY, with Cottage, Yard, Barn, Sheds, and Garden, together with two small Tenements, and Gardens adjoining, and about Five Acres of Nursery and other Land, partly tithe-free. The Tenant will be required to take the Shrubs and Plants at a valuation.—For further particulars, apply to Mrs. OGG, at the Nursery, Beckley, Christchurch, Hants.

FARMS TO LET, WITH IMMEDIATE POSSESSION.

MR. HURLEY, FARM AGENT and VALUER, begs to urge Farmers and Others, requiring either Large or Small FARMS, to make known their wants immediately to him, as he has upwards of FIFTY FARMS, Arable and Meadow, of the first description, from 60 to 600 acres, adapted to every kind of Farming, and rents to meet the times, in Surrey, Cambs, Sussex, Essex, Berks, Bucks, Kent, and Middlesex.—All applications (accompanied by two stamps) addressed to the Auctioneer, 62, Nelson-square, Blackfriars-road, London, will meet with instant attention.—Proprietors having Farms to Let are solicited to insert the same in Mr. HURLEY'S Register.

The FOLLOWING DESIRABLE FARMS are submitted in addition to MR. HURLEY'S last Published List, to which he begs to refer attention, namely:

A VERY EXCELLENT FARM known as "Rookwood Hall," situate in Essex, comprising TWO HUNDRED and EIGHTY ACRES of sound Turnip, Wheat, and Barley Land, Forty Meadow, with capital Residence and Outbuildings.—Rent and tithes moderate.

Also, a SMALL MEADOW FARM of SIXTY ACRES, with very capital House and Buildings, Orchards, &c., situate near Bristol, and a Station on the Exeter Railway.

Likewise, a good FARM of TWO HUNDRED ACRES, 45 Meadow, good Premises, near the Hatfield Station, Herts.

Also, a CAPITAL FARM of FIVE HUNDRED and THIRTY ACRES, in Berks, 74 Meadow, 74 Down Pasture, remainder Arable, with excellent Premises.—Rent, tithe free, 315*l.* a-year. Near the Great Western Railway.

Another in the same County, nearly FIVE HUNDRED ACRES, considered the best Farm in Berks; near a Station on the Great Western Railway.

And lastly, another of FOUR HUNDRED ACRES, same County, and near to the Pangbourne Station on the Great Western Railway.

Rents of each to meet the times. Apply for terms and to treat (inclosing two stamps), to Mr. HURLEY'S offices, 62, Nelson-square, Blackfriars-road, London.

PARTNERSHIP WANTED, in the NURSERY and SEED TRADES.—The Advertiser, a young Man, of business habits, is desirous of taking a share in a business where his personal superintendence and a moderate capital can be made available, and make him a suitable return; or a moderate business would be taken wholly. Persons who are desirous of either personal or pecuniary assistance will find this an eligible opportunity. Full particulars, with real name, addressed to A. B., Mr. W. Hill's Horticultural Works, Greenwich, will have prompt and immediate attention.
This Advertisement will not be repeated.

REMOVAL OF SMITHFIELD MARKET.—Excellent LAIRAGE for CATTLE and SHEEP, at the subjoined low rates, is provided at the ISLINGTON CATTLE MARKET.

LAIRAGE.

Cattle, 3*d.* per head, for one or any number of nights.
Sheep, 6*d.* per score; if at Grass, 1*s.* per score.
Fodder of the best quality on the most moderate terms.
An ample supply of Water.

The accommodation is spacious and extensive, the Sheds covering many acres of ground.

Cattle from a distance may be consigned to the Lairs direct, and upon notice being given by letter, addressed to "the Superintendent of the Islington Cattle Market, Islington, London," will be met at the railway or wharfs, will be provided for at the Lairs, and safely handed over to the Salesman or other parties for whom they may be intended. Foreigners buying cattle in England, and requiring to place them where they may be carefully taken care of until they shall have completed their purchases, or are ready to embark, will find the accommodation offered most desirable and economical.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3 . per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.
See the *Gardeners' Chronicle* first Saturday in each month.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by JAMES PHILLIPS and Co. (the sole agents), 116, Bishopsgate-street Without, London.

THE BIRMINGHAM CATTLE SHOW, 1850.—The CERTIFICATES of ENTRY, for CATTLE, SHEEP, PIGS, and POULTRY, are now ready, and, with the PRIZE LISTS, may be had on application to the Honorary Secretary. Intending Exhibitors are particularly requested to mention the nature of the Stock for which they require Certificates. The entries close on SATURDAY, the 16th of November.

The Show will be held in the BINGLEY EXHIBITION HALL, BROAD-STREET. T. B. WRIGHT, Honorary Secretary.
Union-street, Birmingham, Oct. 12.

POULTRY.—PURE COCHIN CHINA, SUSSEX FOWLS, CROSS-BRED JUNGLE, AND GAME FOWLS, bred by the Zoological Society.—For prices apply to Mr. MILLER, Superintendent, at the Gardens, Regent's Park, London.

COCHIN CHINA FOWLS.—FOR SALE, a few choice full grown Chickens, bred from imported birds.—Apply to JAMES MANNISTER, Pit Place, Grays, Essex. The Gravesend steamers call at Graye pier.

RHEUMATISM.—A WONDERFUL CURE OF WHICH DISEASE HAS BEEN EFFECTED BY HOLLOWAY'S OINTMENT AND PILLS.—Mr. DONALD MCKELLAR, of Murrumbidgee, in New South Wales, states, that a man of about 50 years of age, employed by John Peter, Esq., Justice of the Peace in that Colony, suffered for 12 months from an attack of Rheumatism, brought on by exposure to Wet and Cold; he was so painfully afflicted, that his body was bent nearly double. In this deplorable condition, he commenced using HOLLOWAY'S Ointment and Pills, and so speedy was the cure effected by them, that it seemed to those who had witnessed his sufferings, little less than a miracle.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

Re-issue, Part I., on First October, to be continued Monthly.

In Parts, 2s. 6d. each, Super Royal 8vo.

A

CYCLOPEDIA OF AGRICULTURE,

PRACTICAL AND SCIENTIFIC;

IN WHICH

THE THEORY, THE ART, AND THE BUSINESS OF FARMING,

IN ALL THEIR DEPARTMENTS, ARE THOROUGHLY AND PRACTICALLY TREATED.

BY UPWARDS OF FIFTY OF THE MOST EMINENT FARMERS, LAND AGENTS, AND SCIENTIFIC MEN OF THE DAY.

EDITED BY JOHN C. MORTON,

EDITOR OF 'THE AGRICULTURAL GAZETTE.'

With above One Thousand Illustrations on Wood and Steel.

The object of this Work is to present to the Agricultural Reader the whole of the truth immediately connected with his profession, so far as it is known to the men most familiar with the sciences it involves, the methods it employs, and the risks it incurs. For this purpose, every topic requiring discussion has been placed in the hands of those with whom it has been a matter of personal experience and study.

Agriculture is so extensive a subject, that no one writer can speak from personal knowledge on all its departments; and it is a subject so variable with circumstances, and therefore so liable to misrepresentation, that no other kind of knowledge is worth communicating. Many previous attempts have been made to condense in one Work all existing information on Agricultural affairs; but the Authors, or Editors, however skilful in recording their own experience, and however successful there, have never had equal success in conveying the experience of others. The Agriculturist, in daily contact with Nature, requires the assistance of those who have had personal acquaintance with her laws and requirements; writers retailing an experience at second hand upon these points, can neither be accurate nor full enough for his purpose.

In offering, therefore, to the Agriculturists of Great Britain a Cyclopedia of Agriculture, Practical and Scientific, intended to be a Standard Book of reference on all the subjects of which it treats, we should greatly mistake the exigencies of the times did we present a mere compilation of bygone information, which, however interesting in itself, can be of little real use to the practical man.

The only way in which the knowledge of his art can be brought down to the present day; its various methods—detailed with accuracy for his information; and the explanations given of their success or failure which the now more perfect Theory of Agriculture has furnished; is to place every department of the wide subject in the hands of those who have made it their especial study.

To accomplish this desirable object has been the great aim of the Editor and Publishers of the Cyclopedia of Agriculture; and for this purpose the assistance of our most distinguished agricultural writers has been engaged. Each separate topic will be discussed by its own student, in order that the whole may be presented as perfectly as possible. The reader will therefore receive no mere compilation of other works—he will, in every section of the subject, be instructed by the man who has made it his especial study. Thus, even in the 'Calendar of Farm Operations,' which might, perhaps harmlessly, have been a mere abstract of previous publications on farm practice, the successive sentences have been penned by those who have themselves carried out the processes described, or the instructions suggested: and in that one appendage to the Work, the details of farm operations are given as actually practised in twenty different counties of Scotland and England, by more than twenty of our most successful farmers and cultivators.

As regards the body of the Work, the names of its writers—a list of which is appended—are sufficient guarantee for the practical value of the performance. A Work on the Theory and Art of Agriculture, of which the several departments are undertaken by such contributors, may well command confidence.

Illustrations on wood and steel, of Farm Buildings, Insects, Plants, cultivated and uncultivated, Agricultural Machines, Implements and Operations, &c., will be given wherever it is presumed they can be useful.

A LIST OF THE WRITERS.

THEORY OF AGRICULTURE.

Its BOTANY, fully Illustrated by Wood Engravings—John Lindley, Ph.D., F.R.S. Diseases of Plants—Rev. M. J. Berkeley, M.A., F.L.S., King's Cliffe, Wansford.

Its CHEMISTRY—Lyon Playfair, Ph.D., F.R.S.; John Thomas Way, Consulting Chemist to the Roy. Agricult. Soc. of England.

Its ENTOMOLOGY, including Descriptions and Illustrations of the Insects which injure or benefit Crops, and affect Carne—John Curtis, F.L.S., Author of 'The British Entomology,' &c.

Its GEOLOGY—John Morton, F.G.S., Whitfield, Gloucestershire; Joshua Trimmer, F.G.S., of the National Geol. Survey.

Its HISTORY and GENERAL PHILOSOPHY—C. Wren Hoskyns, B.A.

ART OF AGRICULTURE.

The EDUCATION of its Practitioners—C. Wren Hoskyns, B.A.

Its PECULIARITIES, in England, Scotland, Ireland, and Flanders—Ph. Pusey, M.P.; Rev. W. Hickey, M.A., Thatcham Newbury, Berkshire; John Haxton, Tenant of Drumnod, Cupar-Fife; T. G. J. van den Bosch, Holland.

Its MACHINES, fully Illustrated by Engravings on Wood and Steel—John C. Morton, Whitfield, Berkeley, Gloucestershire.

Its BUILDINGS and ROADS, fully Illustrated by Engravings—James Newlands, C.E., Borough Engineer, Liverpool.

The SOIL: Valuation, Surveying, Enclosures—John Bravender, Land Agent, Cirencester. Improvement of Bogs and Wastes—Rev. W. Hickey, M.A. Draining—John Girdwood, F.R.S.S.A., Agricultural Engineer. Manuring—J. Hannam, Tenant, Kirk Deighton, Wetherby, Yorkshire. Cultivation—John Haxton, Cupar-Fife.

DOMESTIC ANIMALS and their Management: Comparative Anatomy, Diseases, &c.; the Horse, its Breeds and Management—W. C. Spooner, Veterinary Surgeon, Southampton. The Ox, its Breeds and Management; the Sheep, its Breeds and Management—Messrs. James Caird, Wigtonshire; J. A. Clarke, Lincolnshire; Colonel Le Couteur, Jersey; H. Strafford, Editor of the *Short-Horn Herd-Book*; G. Turner, Devonshire; E. F. Welles, Worcestershire; John Wilson, Berwickshire; and A. T. Wilson, Lammermuir. The Hog, its Breeds and Management—John Hannam, Yorkshire. The Dog, Rabbit, Pigeon, Goat, Ass—H. D. Richardson, Dublin. The Alpaca—W. Walton. The Bee—J. Wighton, Costessy Hall, Norfolk. Poultry—Rev. E. S. Dixon, M.A., Intwood-with-Keswick, Norfolk.

The DAIRY—Messrs. Haxton, Fifeshire; Palin, Cheshire; Stallard, Leicestershire; Tucker, Dorsetshire.

CULTIVATED PLANTS, including Crops, Grasses, and Trees—Messrs. Robert Baker, Land Agent and Tenant, Essex; J. A. Clarke, Lincolnshire; Hewitt Davis, Land Agent, London; J. H. Dickson, Flax-dresser and Agent, London; William Gorrie, Farm Manager and Factor, Mid-Lothian; John and Jas. Grigor, of the Norwich and Forres Nurseries; John Haxton, Fife; J. C. Morton; J. M. Paine, Surrey; Hugh Raynbird, Land Agent, Hampshire; William Roach, Gloucestershire; James Smeed, Kent; Robert Thomson, of the Horticultural Society's Gardens, Chiswick; John Towers, Surrey; T. Tucker, Dorsetshire.

ROTATION of CROPS—J. Caird, Tenant of Baldoon, Wigtonshire.

PASTURE FARMING—Messrs. J. A. Clarke, Lincolnshire; J. W. Clark, Hampshire; J. Hannam, Yorkshire.

CALENDAR of OPERATIONS, in Arable, Meadow, Dairy, and Stock Farming—Messrs. Bravender, Caird, J. A. Clarke, J. W. Clark, Glendinning, Gorrie, Haxton, J. C. Morton; Paine, Palin, Raynbird, Richardson, Roach, Russell, Smeed, Spooner, Stallard, Thomson, Towers, Tucker, J. Wilson, A. T. Wilson, J. Wighton.

AGRICULTURAL SOCIETIES—J. C. Morton.

AGRICULTURAL STATISTICS—J. C. Morton.

EFFECT of CLIMATE on the ART, R. Russell, Tenant of Kilwhiss, Cupar-Fife.

DOMESTIC ECONOMY—Bread, Beer, Cider, Meat, &c.—J. Towers, Surrey; William Ewart, Newcastle-on-Tyne.

BUSINESS OF FARMING.

RELATION of LANDLORD and TENANT—C. Wren Hoskyns, B.A.; John Gray, Agent for the Greenwich Hospital Estates; J. Dean, Land Agent; John Morton, Land Agent; J. C. Morton.

RELATION of TENANT and LABOURER—J. Ilderton Burn, of the Labourer's Friend Society; Rev. W. Hickey, M.A.; A. Somerville, Manchester (late of Berwickshire); J. C. Morton.

INVESTMENT of CAPITAL—J. C. Morton.

FARM ACCOUNTS—Thomas C. Morton, Accountant, Manchester.

MARKETS, SALES, &c.—J. Haxton, Fifeshire

LAWS RELATING to AGRICULTURE—J. G. Ball, Solicitor, Stroud; J. Bright, M.P., Rochdale; C. Wren Hoskyns, B.A.

BLACKIE AND SON:

QUEEN STREET, GLASGOW; SOUTH COLLEGE STREET, EDINBURGH; AND WARWICK SQUARE, LONDON.

AND ALL BOOKSELLERS.

SMITHFIELD CATTLE SHOW.

NOTICE.—THE PRINTED FORMS OF CERTIFICATES to be filled up for STOCK and IMPLEMENTS intended to be exhibited at the forthcoming Show in December next can now be obtained of the Honorary Secretary. All such Certificates must be returned, properly filled up, on or before **Saturday, the 16th of November.**

In applying for the Forms for Stock, it is necessary to state the Number of the Class or Classes, as there is a separate Form for each Class.

Prize Sheets and all information can be obtained on application to B. T. Brandreth Gibbs, Hon. Sec., corner of Half-Moon-street, Piccadilly, London.

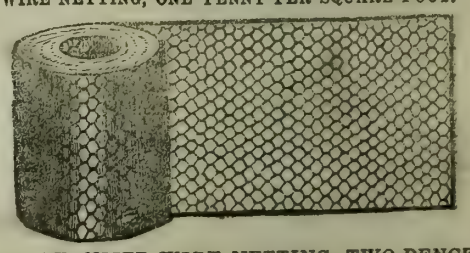
SEED WHEAT—TWO QUITE NEW VARIETIES.

MR. ROBERT BEMAN, of Moreton-in-the Marsh, Gloucestershire, who has been a Seed Wheat Grower for upwards of 30 years, upon a very large scale, has great pleasure in informing his numerous old customers, and agriculturists in general, that he has this season Two magnificent New Varieties of unprecedented productive and good malting qualities, which have been produced each from a single grain, planted five years since, selected from two parcels of Foreign Wheat, samples of which may be seen in the ear and grain on the stand of Mr. Charles Dadge, of Longdon Villa, near Tewkesbury, his agent, at either Worcester, Tewkesbury, or Cheltenham Markets; or Mr. Blyzard, Gloucester; or forwarded by the grower upon pre-paid application, enclosing six postage stamps.

No. 1, he calls PRIMA DONNA.—Straw white; Grain red. Price 4*l.* per quarter.

No. 2, DONNA MARIA.—Red grain and Straw. Price 4*l.* per quarter.

N B.—R. B. is clearly of opinion that those persons who plant the above will counteract the effect of free trade by the abundance of produce, and recommends, from the luxuriance of growth, their being thinly planted.



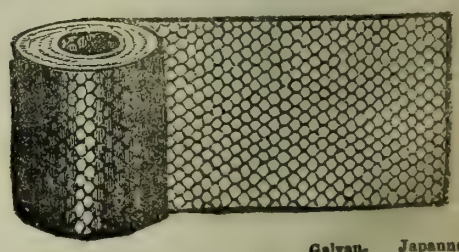
R. B. was also the grower of the following varieties this year, viz, Whitfield White, Red Straw White, White Cluster, Golden Cluster, Red American Spaldings, and Browick Red. Price of each, 52*s.* per quarter; delivered upon either the Great Western, North Western, or Midland Railways, free of carriage, in new sacks, 1*s.* 6*d.* each. Prepaid orders from unknown applicants, enclosing Post-office order or a satisfactory reference, will receive immediate attention.

This Advertisement will not be repeated.

A LARGE STOCK OF SILVERED PLATE GLASS for Mirrors, also Crown and Sheet Glass in Crates and Squares for Dwelling and Hothouse Glazing, at WILLIAM PERKS Junior, and Co.'s, Glass and Lead Warehouse, 52, Dale-end, Birmingham.

DEPOT FOR HARTLEY'S PATENT ROUGH PLATE GLASS.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.* per yard.		30 inches wide	7½*d.* per yard.	
18 ,, ,,	4½*d.* ,,		36 ,, ,,	9*d.* ,,	
14 ,, ,,	6*d.* ,,		48 ,, ,,	1*s.* ,,	

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of Thomas Henry Fox, 44, Skinner-street, Snow-hill, London.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
1½-inch ,, light ,,	...	8 ,,	6 ,,
1½-inch ,, strong ,,	...	10 ,,	8 ,,
1½-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

Printed by William Bradbury, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, October 12, 1850.

NOW SENDING OUT.

BECK'S PELARGONIUMS.—The TWO GUINEA COLLECTIONS of Twelve Plants have amongst them RUBY, SARAH, and DORCAS, seedlings not sent out before, but often exhibited in our winning collections. The set may be had in exchange for a post-office order on Brentford, in favour of JOHN DOBSON; package and carriage to London included. They are in 3-inch pots, and wanting an immediate shifting. Catalogues may be had on prepaid application, enclosing one postage stamp.—Worton Cottage, Isleworth.

JOHN B. SMITH begs most respectfully to inform the Nobility, Gentry, and the Trade that his stock of AZALEA INDICAS are very fine this season, and well set for bloom, and comprise several new and striking novelties. The new yellow varieties of Rhododendrons are very strong and fine, as also Rhododendrons in general, Camellias, Roses, Liliums, &c., all offered at the very lowest ebb of price; Catalogues of which may be had by inclosing a postage stamp.
Norbiton Nursery, Kingston, Oct. 19.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s.* per 100.
Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s.* 6*d.* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 20*s.* per 100.—Manor Farm, Deptford.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.
Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Oct. 19.

NEW SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER has been Purchased by the following Nurserymen:—Messrs. Henderson and Co., Pine-apple-place; Messrs. E. G. Henderson and Co., St. John's Wood; Mr. Charles Turner, Royal Nursery, Slough; Messrs. Bass and Brown, Sudbury; Mr. Keynes, Salisbury; Mr. W. Cock, Chiswick; Mr. B. N. Cant, Colchester; Mr. W. Bragg, Slough; Mr. Wm. Ivery, Peckham, Surrey; and most of the other leading Nurserymen in the kingdom.
Strong Plants now sending out, 20s. each, one-third off to the trade, with one added to every three.
Apply to WILLIAM E. RENDLE & Co.,
NURSERYMEN, PLYMOUTH.

KITLEY'S "GOLIAH" STRAWBERRY.

ROBERT WHIBLEY is supplying fine plants at a very reduced price for cash, viz., 2*s.* per dozen or 10*s.* per 100. Also select CHRYSANTHEMUMS in great variety, blooming plants, in 5-inch pots, from 6*s.* per dozen. Lists can be had.
Chester Nursery, Kennington, near London.

HOYLE'S NEW GERANIUMS AND MAYLE'S NEW FUCHSIAS.

MESSRS. MAYLE AND CO. have a few extra strong cut down plants of Mr. Hoyle's new GERANIUMS, sent out by them last autumn and spring of 1850, at 10*l.*; present price for the set of eight, 3*l.*, smaller plants 2*l.* Mayle's seven new FUCHSIAS (warranted the best ever raised), including Champion and Hebe, sent out in June last, for 5*l.*; present price 2*l.* Circulars can be had.
12 extra fine GERANIUMS, 30*s.*
12 best new CINERARIAS, 21*s.*
STANDARD ROSES, extra sorts, 21*s.* per dozen.
CHRYSANTHEMUMS, 50 varieties, 8*s.* per dozen.
Monument-lane Nursery, Edgbaston, Birmingham.

TO BE SOLD, A GREENHOUSE, Quite New Length 12 feet by 7, by 9 feet high. To be seen at 7, City-terrace, City-road, Londnn.

TRUE DOUBLE ROMAN NARCISSUS, 3*s.* per dozen. The most fragrant and earliest flowering of all the Narcissus. ROBERT HALL begs to advise the arrival of his Annual Importation of the above-named BULBS, in fine healthy condition. Also, fine Dutch HYACINTHS 6*s.* per dozen, or 3 dozen for 15*s.* Crocus, Jonquils, Tulips, &c., at his Foreign Warehouse, 63, South Audley-street, Grosvenor-square, facing the Chapel. Priced Catalogues may be had by post, and postage stamps taken in payment.

TESTIMONIAL TO MR. MUNRO, late Gardener to the Horticultural Society of London.—At a Preliminary Meeting, held at the Roebuck Inn, Turnham Green, September 30th, 1850; Mr. Glendinning, Mr. Thompson, Mr. Cock, Mr. Edmonds, Mr. Gordon, Mr. Caie, Mr. Ayres, and Mr. Ivison being present, Mr. GLENDINNING was called to preside. Mr. Caie was then elected Secretary, and Mr. Edmonds Treasurer.
It was then Resolved, That a subscription not exceeding Half-a-crown for each person should be entered into for the purpose of presenting Mr. MUNRO with a suitable Testimonial of esteem, on his retiring from the superintendence of the Horticultural Society's Garden, which appointment he held for upwards of Thirty years.
Persons desirous of contributing are requested to forward their subscriptions to the Treasurer, Mr. Charles Edmonds, Chiswick House, Chiswick, Middlesex.
It was also Resolved, That the Subscription List be closed on Saturday, November 16th, 1850.
*** Post office orders payable at Turnham Green.

SUPERB NEW SEEDLING PICOTEE AND CARNATION.

JOHN SCHOFIELD AND SON beg to inform their friends, and florists generally, that they are now sending out the following fine Picotee and Carnation, viz., "LADY HARWOOD," H. Purple Picotee, and "KNOWSTHORPE PET," S. Biz. Carnation. Price per pair, 10*s.* 6*d.*, or Four Pairs for 30*s.* The above have been submitted to the meeting, at Worton Cottage, and spoken of in the highest terms. See report, vide *Gardeners' Chronicle*, August 24th, and Florist for September. Also, Mr. Wood's opinion in the Midland Florist for this month. They are confidently recommended as First-class flowers, and a decided acquisition in their class.
J. S. and Son can also supply the following in strong plants.
12 pairs Picotees or Carnations, First-class Flowers, 20*s.* to 30*s.*
12 ditto ditto Carnations, Second-class 6*s.* to 12*s.*
12 Pairs of First-class Pinks, 6*s.* to 12*s.*
12 Finest Show Pansies, 6*s.*, 10*s.*, and 15*s.*
A Catalogue of the above may be had on application.
Pansy Seed from Show Flowers, 2*s.* 6*d.* per packet.
Very select Calceolaria Seed, 2*s.* 6*d.* „
Knowsthorpe, near Leeds, Yorkshire.

TO SEEDSMEN, &c.

ABRAHAM HARDY AND SON, SEED-GROWERS, Maldon, Essex, beg to offer to the trade their Wholesale Priced Catalogue of Vegetable and Flower Seeds. Also Early Seed Potatoes of 1850, grown under their own especial care.
Post-free on application.—Oct. 19.

PELARGONIUM, FOQUETT'S MAGNIFICENT.

CHARLES DIMMICK has now ready strong plants of the above well-established in pots, and requiring an immediate shift, for 7*s.* 6*d.* each; or 30*s.* for six to the trade.
Terms, cash.—Ryde, Isle of Wight, Oct. 19.

CUTHILL'S BLACK PRINCE STRAWBERRY.
Now sending out, price 10*s.* per 100.
Also, PRACTICAL INSTRUCTIONS FOR THE CULTIVATION OF THE POTATO, containing the Competition Essay for the Prize of 1000 francs, offered by the Belgian Government.
Also, Instructions on the Management of Asparagus, Seakale, Rhubarb, Vegetable Marrow, Scarlet Runner, Strawberry, Melon, Cucumber, Chicory and Lamb Lettuce as Salads; the Lisianthus Russellianus, the Tree Mignonette, the Destruction of Woodlice and Green fly; and Peat Charcoal as Manure.
By JAMES CUTHILL, Horticulturist, Camberwell.
London: Printed for the Author, and sold by him, price 2*s.*, or by post 2*s.* 4*d.* Sold also at Hamiltons and Co., 33, Paternoster-row.

PLANTS FOR BLOOMING IN THE CONSERVATORY IN WINTER OR EARLY SPRING.

MESSRS. J. AND J. FRASER, NURSERYMEN, Lea Bridge-road, Essex, beg to offer the following, finely set with bloom-buds, at the undermentioned moderate prices:

AZALEA INDICA, in fine sorts	18*s.* to 30*s.*	per doz.
EPACRIS and ERICAS, ditto	18*s.* to 24*s.*	„
RHODODENDRONS, ditto	9*s.* to 18*s.*	„
KALMIA LATIFOLIA	12*s.* to 18*s.*	„
HARDY AZALEAS, including fine Belgian varieties	9*s.* to 18*s.*	„
MOSS AND PROVENCE ROSES	12*s.*	„
LILACS, GUELDRE ROSES, DEUTZIAS, WEIGELA ROSEA, &c.	12*s.*	„

The above are all beautifully grown, and well established in pots, and are fit for immediate forcing. Remittances respectfully requested from unknown correspondents.

HUNTINGDON NURSERIES.

MRS. WOOD, in returning her sincere thanks for the kind patronage she has received in the Nursery, Seed, and Flower Trades, begs to announce that she has retired from the same, in favour of her Nephew, Mr. JOHN INGRAM, by whom for some years past the Business has been superintended, and for whom she earnestly solicits a continuance of that support which for upwards of a century has been accorded to her late husband's family. All debts owing to and from Mrs. WOOD will be received and paid at the Nurseries, Huntingdon; and it is respectfully requested that all post-office orders be made payable to SUSAN WOOD.
JOHN INGRAM, in succeeding to the above business, most respectfully informs the planting and horticultural public, that nothing shall be wanting on his part to merit a continuance of the favours for so many years liberally bestowed on his predecessors. The stock comprises an immense quantity of Fruit, Forest, and Ornamental Trees, Evergreens, Roses, &c., as well as a large collection of Stove, Greenhouse, and Bedding Plants, with every description of Florists' Flowers, of all of which Catalogues may be had on application. Seeds for the supply of the Kitchen and Flower Gardens are grown on the premises, the detached character of these Nurseries affording excellent facilities for keeping the varieties pure and distinct.
A few stocks, containing fine dormant buds, of the STANWICK NECTARINE to be sold at 21*s.* each. Very fine well-rooted SPRUCE FIRS, 2 to 3 feet, 30*s.*; 3 to 4 feet, 35*s.* per 1000.
Huntingdon is situated on the main trunk of the Great Northern Railway, which will afford a cheap and rapid transit both north and south.
N.B. The business will in future be carried on under the firm of "WOOD and INGRAM."

NEW SEEDLING PANSIES—"COMMANDER IN-CHIEF" AND "PRINCE ARTHUR."

YOUELL AND CO. beg to announce they are now prepared to execute orders for the above first-rate PANSIES, which they guarantee will give the highest satisfaction.
"COMMANDER-IN-CHIEF" was exhibited at the Worton Cottage Meeting of May 29th, under the initials of "T. T.," and the following opinion is given in "Beck's Florist" of July last: "No. 2, Yellow ground, bronzy purple top petals, lower ones margined with the same colour, bold eye, showing to great advantage: *a fine flower for Exhibition.*"
The following opinion of this fine flower is also given in the *Gardeners' Chronicle*, of June 20th, under the initials of "Y. Y." "No 2, Rich yellow ground, top petals dark maroon, lower petals margined with the same colour—eye good; a full-sized and fine flower."
"PRINCE ARTHUR," white ground, top petals rich dark purple, lower ones margined with the same colour, eye good—flowers large and of great substance.
This was exhibited with "Commander-in-Chief" at the Worton Cottage Meeting, and obtained the following opinion: "No 38, Style of Optimus, and a considerable improvement upon it, having more ground colour."
Strong plants of the above 5*s.* each per post free if required; and one over to the Trade when three are ordered.
Royal Nursery, Great Yarmouth, Oct. 19.

J. AND J. FAIRBAIRN having an immense Stock of remarkably fine FRUIT TREES, trained and untrained, consisting of Peaches, Nectarines, Apricots, Pears, Plums and Cherries, in a large assortment of the most approved kinds; also a very large stock of ornamental Forest Trees, Flowering Shrubs, and Evergreens, on land they are anxious to clear, are induced respectfully to solicit the attention of Gentlemen planting to an inspection of the same, which they intend to offer at such prices for cash as they hope will insure their liberal orders.
J. and J. F. also beg leave to solicit the attention of Gentlemen wishing to furnish Greenhouses, Conservatories, &c., to their stock of Cape Heaths, Epacrises, Chinese Azaleas, Boronias, &c., which is unusually large and fine this season, to which they will affix the most moderate prices, to induce the favour of extensive orders.
Nurseries, Clapham, near London, Oct. 19.

THE PRICE CURRENTS (Nos. 40 and 41) of LOUIS VAN HOUTTE, NURSERYMAN, Ghent, Belgium, are to be had of Mr. GEORGE RAHN, 52, Mark-lane, London.
LOUIS VAN HOUTTE begs especial attention to the following: Achimenes, Alstrœmeria brasiliensis, chilensis, Errembaultii, odorata rosea; Seedling Gloxinias (and among them Gl. Marie Van Houtte, the best in the trade, which obtained, last summer, first medals at the Brussels and Antwerp shows); splendid seedlings of Sparaxis, Tropæolum azureum, fine roots; Camassia esculenta, very fine varieties of Gladioluses, and the well-known Gl. Gandavensis, in quantity; the true Lilium japonicum (not L. Brownii), Lilium lancifolium roseum corymbiflorum, L. Szowitsianum, testaceum; fine Anemones and Ranunculus of the celebrated collection of Madame Quetel, &c. Æchmea miniata, Æschynanthus Teysmanii, Conoclinium Ianthinum, Hoya Sieboldii, Pharus scab. vittatus, the splendid Rogiera cordata, Drymis Winterii, Petunia Meleagris (very fine), Siphocampylus amœnus (quite new), seedling Antirrhinums, very fine collection of new Daisies, Dianthus Delaby, Epimedium violaceum atroviolaceum, new Lobelias, Cercis japonica, and Morus Kæmpferi, in fine plants, both from Dr. Siebold's recent introduction; Pyrus japonica rosea and atrosanguinea, also from Dr. Von Siebold; Azalea indica, and the new collection of Ghent Azaleas (hardy), of which L. VAN HOUTTE bought the entire stock; the well-known VAN HOUTTE'S Calceolarias (Seeds), all the new Chrysanthemums, Coniferous Plants, fine Salisburias from seed, Ferns of every description, the new Fuchsias from M. Linden (distinct species), the very curious and beautiful Stanhopea ecornuta, large collection of Palms, an extremely fine collection of the best varieties of Ghent Herbaceous Pæonies, the celebrated Rhododendron Vervaeniauum flore pleno (in fine bushy plants), the novelties in Roses, &c. &c.
N.B.—The Camellia Catalogue is in preparation.
The usual discount to the trade.—PLANTS IN LONDON FREE.

TO GENTLEMEN PLANTING FRUITS, AND TO THE TRADE IN GENERAL.

JOHN BELL, having disposed of his Nursery Business, begs to offer the remainder of his fine healthy Stock of FRUIT TREES, at the following low prices, having only a short time to clear the Ground:

	Per Doz.	Per 100.

A remittance requested from unknown correspondents.
Strong 4-year-ol Whitethorn, 2*s.* 6*d.* per 1000, in large quantities.

FIRST CLASS CRIMSON BIZARRE CARNATION.

WOOD'S "SOUTH LONDON," which was awarded a First Class Certificate at the Royal South London Show in 1849, and received the highest encomiums from the floricultural press at the time, is now ready for sending out. Being above the average size, it will be found a first-rate flower for showing in collections, as well as single blooms. Price, 10*s.* per pair, postage free.

Also WOOD'S "MR. HERBERT," a first class heavy-edged purple Picotee, at 5*s.* per pair, postage free.

Cash with orders from unknown correspondents is respectfully requested.—WOOD and INGRAM, Nurseries, Huntingdon.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

RENDLE'S NURSERY, PLYMOUTH, Established 1786.

WILLIAM E. RENDLE AND CO. have this season A LARGE SURPLUS STOCK of many sorts of FOREST TREES and SHRUBS. For prices see the *Gardeners' Chronicle*, October 12, 1850.

Our Autumnal Catalogue of Forest Trees, Shrubs, and Fruit Trees, is just published, and can be had for one penny stamp.

Apply to WILLIAM E. RENDLE AND CO.,
NURSERYMEN, PLYMOUTH.

FRUIT TREES.

THOMAS RIVERS begs to submit to the Public a SYNOPSIS of his FRUIT TREE CULTURE. The names of varieties, with descriptions and prices, are given in his Descriptive Catalogue of Fruits, published in October, 1849, sent post free for four postage stamps. A Supplement to this will shortly be issued.

APPLES.—Standards for Orchards, and Pyramids and Dwarfs, on Crab Stocks; Pyramids and Dwarfs, and Dwarfs Trained, for Gardens, on Paradise Stocks.

APRICOTS.—Dwarfs, Dwarfs Trained, Standards, Standards Trained, and Dwarf Bushes in pots for culture under glass.

CHERRIES.—Standards for Orchards, Dwarfs, and Dwarfs Trained on the common wild Cherry stock, Dwarfs for Bushes or for potting for culture under glass, Dwarfs in pots, and Dwarfs Trained on the Cerasus Mahaleb stock.

CURRANTS.—Bushes and Pyramids.

FIGS.—Dwarf Bushes in a bearing state in pots.

GOOSEBERRIES.—Bushes, 80 large Lancashire varieties, 20 small high-flavoured ditto.

GRAPES.—Vines, from eyes, in pots, for Vineries and Hothouses, fine and well ripened under glass; Ditto hardy kinds for walls, also from eyes growing in the open quarters; plants fine, 7 to 8 feet in height.

MEDLARS.—Standards, Dwarfs, and Pyramids.

NECTARINES AND PEACHES.—Dwarfs, Dwarfs trained, Standards, Standards trained, and Dwarf Bushes in pots in a bearing state for culture under glass.

NUTS AND FILBERTS.—Dwarfs and Standards for garden culture, grafted on the Spanish Hazel Nut. These form very prolific trees.

PEARS.—Standards for Orchards, Pyramids, Dwarfs, and Dwarfs trained on Pear stocks; Pyramids from one to six years old, 1*s.* 6*d.* to 3*s.* 6*d.* and 5*s.* each; the two latter descriptions capable of bearing a good crop the first summer after planting. Dwarf Bushes for potting and Dwarfs trained for espaliers or walls on Quince stocks. Many acres are devoted exclusively to the culture of Pears. A few varieties can be had grafted on the Hawthorn and Mountain Ash, but they cannot be recommended.

PLUMS.—Standards for Orchards, Standards trained, Pyramids, Dwarfs and Dwarfs trained for espaliers or walls. The Pyramids are nearly all in a bearing state, so as to be able to give fruit the first summer after planting. Dwarf Bushes in a bearing state, and Dwarf Bushes in pots for culture under glass, grafted on the Sloe (Prunus spinosa).

QUINCES.—Standards of the common, and Pyramids of the large Portugal Quince, the finest and most abundant bearer, even when young, of all the Quinces.

RASPBERRIES.—Canes of all the select varieties.

STRAWBERRIES.—Plants of all the varieties worthy of cultivation.

MULBERRIES.—Standards and Dwarfs. Some fine Standards can be supplied 35 to 40 years old. These are 6 to 7 feet high, perfectly straight, and measure from 8 to 16 inches in girth 5 feet from the ground. They have all been removed within three years, and will transplant with safety.

THE MINIATURE FRUIT GARDEN; or, the Culture of Pyramidal Fruit Trees. Third edition. Sent free per post for 24 postage stamps. Shortly will be published THE ORCHARD HOUSE; or, the Culture of Fruit Trees in Pots Under Glass. By THOS. RIVERS.—Sawbridgeworth, Herts, Oct 19.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

JOHN HARRISON, NURSERYMAN, Darlington and York, having a great stock of that beautiful, delicious, and very early STRAWBERRY, "CUTHILL'S BLACK PRINCE," begs to offer fine strong plants at 7*s.* 6*d.* per 100, or 60*s.* per 1000. Also the undernamed Fruit Trees, Shrubs and Plants. All orders to be addressed to the Nursery, Darlington.

Fastolff Raspberries, 7*s.* 6*d.* per 100, or 60*s.* per 1000.
Raby Castle or Victoria Currants, 12*s.* per 100, or 5*l.* p. 1000.
Champagne Red ditto, 8*s* per 100, or 60*s.* per 1000.
Common Red Currant, 5*s.* per 100, or 40*s.* per 1000.
The "Bang-up," fine large Black Currant, the best in cultivation, 10*s.* per 100, or 80*s.* per 1000.
Common Black Currant, 5*s*, per 100, or 40*s.* per 1000.
Aston Red Gooseberries, 8*s.* per 100, or 70*s.* per 1000.
Rhubarb, Victoria, fine, 35*s.* per 100, or 15*l.* per 1000. [per 100
" Royal Albert, fine plants, 12*s.* per dozen, or 80*s.*
" Linnæus, fine, 12*s.* per dozen, or 80*s.* per 100.
Bay Laurels, 1 to 2½ feet, 25*s.* to 50*s.* per 1000.
Rhododendron ponticum, 1 to 1½ and 2 feet, 20*s.* to 40*s.* p. 100.
Laurustinus, 9 inches to 1 foot, fine, 20*s.* to 30*s.* per 100.
Berberry aquifolia and Dulcis, 1 to 2 feet, 15*s.* to 20*s.* per 100.

ROSES FOR STOCKS.

Blush, China, 1 to 1½ foot, 10*s.* to 15*s.* per 100.
Manettii, 10*s.* 6*d.* to 20*s.* per 100.
Celina, the best stock for strong soils, 10*s.* to 20*s.* per 100.
Boursault, 8*s.* to 12*s.* 6*d.* per 100.
Standard Roses, in 100 fine varieties, 7*l.* to 10*l.* per 100.
Dwarfs ditto, in 100 fine varieties, 6*l.* per 100.
Dwarfs, Mixed for Borders, 1*l.* 10*s.* to 2*l.* per 100.

Phlox omniflora, 20*s.* per 100.
Delphinium Barlowii, 50*s* per 100.
Superb Double Hollyhocks, 9*s.* to 18*s.* per dozen.
Carnations and Picotees, all the choice new show varieties, from 1*s.* to 10*s.* 6*d.* per pair (See Catalogue).
Chrysanthemums, all the best new varieties, 9*s.* to 18*s.* p. doz.
Dahlias, Ground and Pot Roots in every choice variety.
Pansies, all the new and best varieties, such as Frances Cycole, Juventa, Miss Edwards, Helen, Disraeli, Lucy Neal, Addison, Duke of Norfolk, Example, Jenny Lind, Mrs. Beck, Mrs. Bragg, Gem, Androcles, Clio, Cypress, Charmer, Hero, Duchess of Norfolk, Queen, Alexis, Cracker, Almanzer, Fire King, Achilles, &c., 18*s.* per doz., own selection; purchaser's selection, 24*s.* per doz.
Pansy seed, saved from all the choicest varieties, 2*s.* 6*d.* per packet of 200 seeds.

Catalogues of Roses, Carnations, Picotees, Pansies, Greenhouse and Stove Plants, Forest Trees and Shrubs, &c., may be had on application.—Darlington Nursery, Oct. 19.

TO NOBLEMEN, GENTLEMEN, AND PUBLIC COMPANIES.

C. LODDIGES AND SONS beg most respectfully to inform the above, that in consequence of the land upon which their celebrated Arboretum is planted being required for building purposes, they are determined to offer the STOCK at such a reduction in price (for cash only) as cannot fail to attract the attention of all who are engaged in extensive ornamental planting. The trees are of the finest description, and range from 6 to 10 feet high.

	Named. Per doz.	Unnamed. Per 100.

N.B. Packing will be charged as low as possible. Post-office orders made payable either in London or Hackney.
Hackney, Oct. 19.

NEW FANCY GERANIUMS.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, begs to announce that he is now prepared to send out the following new and beautiful FANCY GERANIUMS, raised by him, and proved in 1850. For description see *Gardeners' Chronicle* of October 5th, or Catalogue, which may be had, free, on application.

BLACK PRINCE, 10*s.* 6*d.* — PRIMA DONNA, 10*s.* 6*d.*
EXQUISITE, 10*s.* 6*d.* — PRINCE ALBERT, 10*s.* 6*d.*
MARION, 10*s.* 6*d.* — REINES DES FLEURS, 10*s.* 6*d.*

Also, NEW PELARGONIUMS.

CORA, 7*s.* 6*d.* — PRINCESS ROYAL, 10*s.* 6*d.*
FIREBALL, 10*s.* 6*d.* — STANDARD BEARER, 10*s.* 6*d.*

E. G. H. will also be ready, in November, to send out the following set of new CINERARIAS, with the exception of the two varieties marked thus *, which cannot be sent out before the spring; and as the stock of those beautiful varieties will be limited, purchasers of the set will be first supplied.

AMY ROBSART, 7*s.* 6*d.*, lilac rose, self, dark disk, fine form.
CLARA MOWBRAY, 7*s.* 6*d.*, ruby carmine, with black disk, large flower, and novel colour.
DELICATA, 7*s.* 6*d.*; white and bright lilac, equally divided; dwarf habit, and an abundant bloomer.
EFFIE DEANS, 7*s.* 6*d.*; white, deeply edged with dark purple, dark disk, good habit.
FAIRY QUEEN, 7*s.* 6*d.*; white ground, with an edging of light rose; large flower and good habit.
*LADY HUME CAMPBELL, 10*s.* 6*d.*; the purest ground we have ever seen, with a bright purple blue; excellent form and habit; a first-rate flower.
*MADAME SONTAG, 10*s.* 6*d.*; beautiful clear white, with deep edging of porcelain blue, dark disk, dwarf and excellent habit, fine form.
MARGARETTA, 7*s.* 6*d.*; dark blue purple self, moderate size, well arranged flower, and a free bloomer.
LADY ARAMINTA, 7*s.* 6*d.* (gratis to purchasers of the set), blue, with a circle of violet crimson round the disk; dwarf habit, and a well-arranged flower.

TO GARDENERS, &c.

GUTTA PERCHA TUBING for Watering Gardens, spreading Liquid Manure, &c., may be had joined up to any length. Waterproof Soles for Boots and Shoes. Thread for tying up Plants. Gutta Percha Canvas suitable for nailing up Trees, &c.—Manufactured by THE GUTTA PERCHA COMPANY PATENTEES, 18, Wharf-road, City-road, London.

NURSERIES, CHESHUNT, HERTS.

A. PAUL AND SON respectfully inform their Customers and the Public in general, that their New and Descriptive CATALOGUES of Roses and Hardy Ornamental Flowering Trees and Shrubs are now ready. Applications, enclosing two stamps for the Rose, and one for the Tree Catalogue, will be immediately attended to.

LATE SEEDLING GOOSEBERRY, "NEGRO BOY."

Two-year plants, 5*s.* each; one-year do., 3*s.* 6*d.*

JOHN WILLISON can supply the above splendid GOOSEBERRY, which has been tested by hundreds with the best varieties. Two dishes were shown at Whitby on the 24th Sept. last, for which an extra prize was awarded. The following extracts are selected from the editors' opinions.

Gardeners' Chronicle, Sept. 15, 1849.—"*J. W.* Late seedling Gooseberry, dark red, rich flavour, and would doubtless be good for preserving. It retained its flavour during carriage better than is generally found to be the case with Gooseberries."

Midland Florist for October.—"Willison's Negro Boy Gooseberry. We have this day (Sept. 18) received specimens of the above fruit; though not large, yet the lateness of its season renders it a valuable acquisition for the dessert. The specimens were perfectly smooth, of fine flavour, and a very dark colour; in fact, as they lay in the box, packed in cotton wool, they looked more like Damsons than Gooseberries."

Gardeners' and Farmers' Journal.—"*J. W.* We pronounce this winter Gooseberry excellent, and, for so late in the season, of an exquisite flavour."

STRAWBERRIES.—A few of the best varieties, viz., Cuthill's Black Prince, 10*s.* 6*d.* per 100; Kitley's Goliah, 10*s.* 6*d.*; Myatt's Eleanor, 5*s.*; British Queen, 3*s.* 6*d.*; Keens' Seedling, 3*s.*; Elton Pine, 3*s.*; Swainston do., 3*s.*

RHUBARB.—Victoria, 6*s.* per dozen; Royal Albert and Linnæus, 8*s.* per dozen.

The usual discount to the trade. All orders made payable to JOHN WILLISON, Flowergate, Whitby.

PLANTING SEASON.—NURSERY GROUNDS, RED LODGE, NORTH STONEHAM, NEAR SOUTHAMPTON.—An unlimited supply of every description of FOREST, FRUIT, AND ORNAMENTAL TREES, AMERICAN PLANTS, AND FLOWERING SHRUBS, may be procured from these extensive grounds, at the most reasonable prices, printed Catalogues of which may be had of the proprietor, WM. ROGERS, Sen., NURSERYMAN AND CONTRACTING PLANTER.

Transplanted Forest Trees, 1 to 2 feet, adapted for extensive Forest or Coppice Planting, usually sold by the thousand; and also of a large size, for Ornamental Planting, or immediate effect, from 3 to 12 feet, the prices varying from 25*s.* to 5*l.* p. 100.

Ash, Beech, Birch, 15*s.* to 30*s.* per 1000; Spanish Chestnut, 20*s.*, 30*s.*, and 40*s.*; Larch Fir, 7*s.* 6*d.* to 20*s.*; Spruce, 20*s.*, 30*s.*, and 40*s.*; Scotch, 10*s.*, 15*s.*, and 20*s.*; Pinaster, 10*s.*, 15*s.*, and 20*s.*; Sea Pine, adapted for exposure to the sea, 15*s.*, 25*s.*, and 40*s.*; Mahonia, for cover, 40*s.* to 80*s.*; Hazel, 15*s.*, 20*s.*, and 35*s.*; English Oak, 15*s.*, 20*s.*, and 40*s.*; Poplar, 20*s.*, 30*s.*, and 40*s.*; Quicks, 5*s.*, 7*s.* 6*d.*, and 10*s.*

Planting contracted for to any extent from 5*l.* to 20*l.* p. acre.

ORNAMENTAL TREES AND SHRUBS.

Rhododendron ponticum, 2 to 6 inches, 20*s.*, 40*s.*, and 80*s.* per 1000; 1 foot, single stems, fit for working, 10*s.* per 100; 1½ to 2 feet, strong, 20*s.* to 40*s.* per 100, fit for planting out at once to cover; 4 to 6 feet, single stems, for working the beautiful scarlet and other fine kinds, 50*s.* per 100. Tree Rhododendrons may thus become as generally cultivated as Tree Roses. Scarlet Rhododendrons, 18*s.* per dozen; hybrid scarlet, lilac, and white, with large handsome trusses of flowers, 4 to 6 inches, 25*s.*; 1 foot, 40*s.* per 100; Kalmia latifolia, 2 to 4 inches, 8*s.* to 12*s.* 6*d.* per 100; 1 to 2 feet, blooming buds, 50*s.* per 100; 2 to 3 feet, fine, 75*s.* per 100; Epigæa repens, 50*s.* per 100; and all other American plants at equally low prices.

Dwarf Rose Stocks for working, 8*s.* per 100; Single Camellias, 25*s.*, 40*s.*, and 50*s.* per 100, fit for working; Double Camellias, of sorts, on own roots, 6 to 9 inches, 12*s.* per dozen; Pinus (Abies) Douglasi, from seed, 6 to 9 inches, 10*l.* per 100 or 30*s.* per dozen; Arbutus, 12 inches, 8*s.* per 100; 1½ foot, 20*s.* per 100; 2 feet, 30*s.* per 100; Laurel, 8*s.* to 20*s.* per 100; Laurustinus, bedded, 40*s.* per 1000, 8*s.* per 100; Variegated Holly, 1 foot, 25*s.* per 100; Clematis azurea grandiflora, 6*s.* per dozen, 42*s.* per 100; Deutzia scabra, 2 feet, 12*s.* 6*d.* per 100; Common China Rose, 12*s.* 6*d.* per 100; Tree Roses of the most select kinds, 5*l.* per 100; Dwarf Roses, 50 sorts, named, 50*s.* per 100; Double White, Double Red, and New Crimson Thorns, 40*s.* per 100, 6*s.* per dozen; Large Dutch Honeysuckles, 12*s.* 6*d.* per 100; Giant Irish Ivy, 8*s.* per 100.

The prices are for wholesale, if ordered in less quantities a higher price will be charged. All orders above 5*l.* carriage paid to London.

American purchasers will find great advantages in procuring their supplies from these grounds, from their proximity to the Docks whence the American steam-packets take their departure, thus saving the delay and expenses of Land Carriage.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK Manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted. Priced lists of plant tubs and boxes forwarded on application.

DOUBLE PANSY "COMPACTUM."

A. DODS has a fine healthy stock of the above beautiful novelty which he is now sending out at 5*s.* each, or seven for 30*s.*—Rose Hill, Brighton, Oct. 19.

FIRST CLASS SEEDLING PANSIES.

JAMES NEILSON, AUCTIONEER and FLORIST, Falkirk, begs respectfully to intimate to the lovers of the PANSY, that he will send out his celebrated Seedling Pansies by the end of October, viz., JEROME, NORAH, and BOULANGER. The following is a description of the Flowers:

JEROME has a creamy-white ground colour, beautifully laced with a light blue lilac-purple on the three under petals, with upper petals the same as the lacing, and a striking large bold dark centre; form and substance first-rate, and was awarded the First Class Certificate by the Scottish Pansy Society.

NORAH has a pure white ground, most superbly laced with blue purple, fine dark centre, edges smooth, and form perfect, and is most decidedly the thickest Pansy with a white ground in cultivation; and can never be much improved upon, as it is the perfection of the Pansy.

BOULANGER has a golden yellow ground of the richest colour imaginable, and laced with a brown purple; has a large conspicuous dark centre, with edges smooth and form perfect; and, if the expression may be used, with substance thick as leather.

The above three flowers will be an acquisition to any collection whatever; indeed, as much so as "Magnificent" was when sent out by J. N., and is still to this day.

Plants of the above will be sent post free to any part of the United Kingdom at 5*s.* each, with the usual discount to the trade only, when more than three plants are taken. "Boulanger" will not be sent out till Spring. Remittances from unknown correspondents payable at the Post-office, Falkirk.

Falkirk, Oct. 19.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

GEORGE JACKMAN, NURSERYMAN, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

RHODODENDRON CINNAMOMUM var. CUNNINGHAMI.

MESSRS. GEORGE CUNNINGHAM AND SON are now prepared to send out plants of the above-named splendid RHODODENDRON. It is figured in the August Number of "Paxton's Flower-Garden; by John Lindley and Joseph Paxton." And for a description of its merits and origin, the advertisers refer the public to that periodical. The price is 21*s.* each, with the usual discount to the trade.

Oak Vale Nursery, Liverpool, Oct. 19.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready. It contains Descriptive Priced Lists of Superb Seedling and other Ranunculi, Gladioli, Early and Double Tulips; also Priced Assortments of Choice Imported Dutch Hyacinths, Narcissus, Iris, Jonquils, Crocus, the Lancifolium and other Lilies, with a great variety of other bulbs and dry roots. The latter part contains Descriptive Lists of Choice and Select Roses, a few New and other desirable Evergreen and Flowering Shrubs, Hardy Climbing and Hardy Herbaceous Plants, Prize Gooseberries, and other choice fruits, &c.

A separate List of Geraniums and other new and select plants at reduced prices. Catalogues forwarded, prepaid, for two penny stamps.

Our Foreign Bulbs have arrived in fine condition.

Seed and Horticultural Establishment, Sudbury, Suffolk.

FOREIGN BULBOUS ROOTS.

WM. HAMILTON, SEEDSMAN, &c., 156, Cheapside, London, begs to state that his Priced Catalogue of the above is now ready, and may be had gratis on application.

HYACINTHS in colours, named, for pots or glasses, 6*s.*, 9*s.*, and 12*s.* per dozen; in mixtures, 3*s.* per dozen. MIXED DUTCH CROCUS, 1*s.* 6*d.* per 100. TULIPS for early forcing, 1*s.* per dozen. SNOWDROPS, 2*s.* 6*d.* per 100. NARCISSUS, 4*d.* to 6*d.* each. GLADIOLUS, IXIAS, IRIS, RANUNCULUS, ANEMONES, and a large assortment of other Roots, the prices of which will be found in his Catalogue.

W. H.'s Improved Supporter for Hyacinths, &c., 6*d* each.

*** Not to be equalled by any now offered to the public.

Address—156, Cheapside, London.

HYACINTHS AND OTHER ROOTS.

RENDLE'S NEW PRICED CATALOGUE OF BULBOUS ROOTS

Is just published, and can be had on application, gratis. It contains a DESCRIPTIVE *List of all the best Hyacinths, Tulips, Iris, Ranunculus, Anemones, Crocus, Liliums, Gladiolus, Ixia, &c., with some excellent* CULTURAL ADVICE *as to the best method of growing them. It will be found of great service to all growers.*

The "Collections of Seeds" sent out by us having given such universal satisfaction, we have been induced to offer the following "Collections of Roots," which we are certain will please every purchaser.

For the List of Roots contained in the Collections, see our new Book Catalogue.

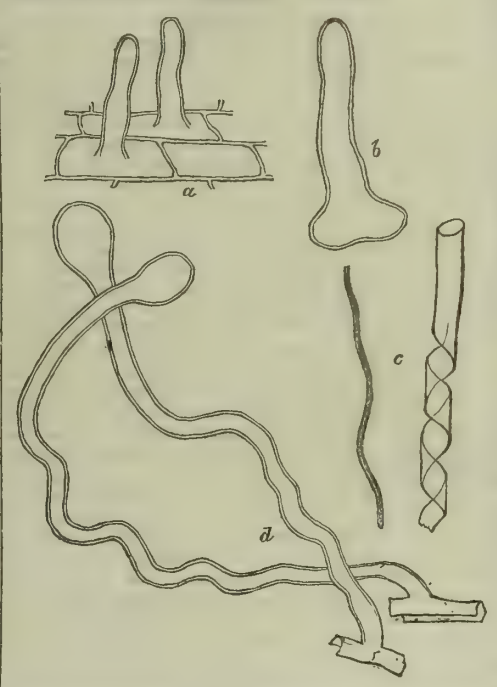
COLLECTIONS OF BULBS.	£	*s.*	*d.*
No. 1 Collection, all the most approved sorts ...	3	0	0
No. 2 Collection, containing smaller quantities ...	2	0	0
No. 3 Collection, for a small Garden	1	0	0

For details of Collections, see Catalogue.

100 Hyacinths in 100 very fine sorts. Purchaser's selection	3	0	0
100 Hyacinths in 50 fine sorts. Purchaser's selection	2	10	0
50 Hyacinths in 50 superior sorts ditto ...	1	10	0
50 Hyacinths in 25 superior sorts ditto ...	1	5	0
24 Hyacinths in 12 superior varieties ditto ...	0	12	0
12 Hyacinths in 12 superior varieties ditto ...	0	6	0

Where the selection of Hyacinths is left to W. E. R. and Co., they request to be informed whether they are intended for water, pots, or the open ground; also whether single or double Hyacinths are preferred. When the choice is left to them they generally send about two-thirds double, and one-third single, which gives a greater variety. Purchasers may rely upon really good sorts being selected when the choice is left to ourselves, and we will guarantee to give them satisfaction.

For Catalogues, and further information, apply to WILLIAM E. RENDLE AND Co., Seed Merchants, Plymouth.



N.B. Our Hyacinths and other roots have just arrived from Holland in excellent condition.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 19, 1850.

IT is an established fact in vegetable physiology that the principal part of the NUTRIMENT OF PLANTS is absorbed by the tips of the roots. In some plants, however, where the exigencies of a quick supply of moisture are great, and the number of roots small, or where moisture is to be derived from the surrounding atmosphere, a further provision is made of a coating of hairs, which multiply almost in an infinite degree the absorbing surface. DE CANDOLLE indeed says that hairs are not found either upon true roots, except at the moment of germination, nor upon any portion of the stem that is formed under ground, nor upon any part that grows under water. The roots of many Orchids, Epiphytal and terrestrial, however, are an exception; a fact pointed out by LINK, in his Remarks on the Structure of Orchideæ, read before the Berlin Academy in February 1850, as also by IRMISCH, in his elaborate treatise on bulbous and tuberous Monocotyledons, and they exist on the tuber-like bodies so common in terrestrial Orchids as well as on the real roots. We find similar hairs on the aërial roots of Ivy, on Cauliflowers, on Grasses, as *Piptatherum multiflorum*, the common Maize, &c.; and in our three species of *Drosera*, where the simple roots which contain abundant starch granules and perform the office of the thickened roots of some Orchids, are constantly submerged and so coated with flocci as to present an aspect similar to that of *Chorda tomentosa*. It is probable that the presence of hairs on roots is a very frequent phenomenon, though only recently observed, and one which must be of great importance in the economy of plants.

As far as we have seen at present the hairs are always without partitions. Two forms occur; one in which the internal wall is apparently altogether simple, and another where a spiral structure is evident either through the whole or a portion only of the thread. In *Cranichis muscosa* and *monophylla* we have observed two kinds of hairs, the one larger and either simple or consisting (in part) of a broad spiral lamina; the other much smaller, darker, and simple. In *Monadenia rufa* irregular granular bodies are scattered over the threads, which may, however, possibly be extraneous. As the matter seems to have been but little noticed, we subjoin a sketch of the hairs on the roots of *Drosera anglica*, *Cranichis muscosa*, and some species of *Eria*, from the gardens of the Horticultural Society. In every case they arise directly from the external cells, of which they seem to be a mere dilatation. *M. J. B.*

a, hairs in a species of *Eria* springing directly from the external cells of the aerial roots; *b*, a hair with the cell from which it sprang—in this case smaller than the others—separated by pressure from the rest of the tissue; *c*, two kinds of hairs on roots of *Cranichis muscosa*,—in *Cranichis monophylla* we have not observed the larger hairs to have a spiral structure; *d*, hairs of *Drosera anglica*.

LIKE everything else connected with the POTATO DISEASE, the question of whether TOMBELLE-LOMBAS' plan of cutting off the mildewed haulm at the period *when the flowers are beginning to form fruit*, is advantageous or not, has given rise to the most opposite opinions. Some maintain the excellence of the practice; others find no advantage in it. We shall not attempt, on the present occasion, to reconcile conflicting statements, or to show how imperfectly the Belgian directions have been in some cases observed; we shall merely describe what happened in a case within our personal knowledge.

In the beginning of April last a few Potatoes, of a seedling Kidney Potato, were received from Mr. W. STENT, of Stockworth, as a variety of great excellence, but not very early. They were immediately planted in heavy, well-drained, kitchen-garden land, without manure. In the beginning of August they were in flower. The flowers were nearly all removed. In the midst of August the leaves were extensively spotted, and, with the haulm, became offensive to the smell. After remaining in this condition three or four days, the whole were cut down with a *sharp knife*, so as not to disturb the roots. About 4 inches of earth were then thrown over the the ground, and the whole was rolled down firmly. Near the end of September the crop was dug. The Potatoes were excellent in quality, perfectly ripe, fully formed; and, out of a bushel and a half, not above a score were bad ones. The produce was at the rate of a bushel a perch.

The smallness of the crop does not appear to have been caused by the operation; but is to be accounted for in the following manner. In the first place, the length of the haulm of the new variety having been unknown, the Potatoes were planted at twice the proper distance. Secondly, several of the sets never came up, so that there were large gaps in the plot of ground. It is not improbable that the crop, if planted at a proper distance from set to set, would have been twice as great.

We own that this experiment, to say nothing of some others on record, leads us very forcibly to the conclusion that the Potato crop does not sustain material damage from the loss of the haulm, *if it is not removed till the berries are beginning to swell*; and also that the method of cutting it off, slightly earthing up the ground, and then rolling it *well*, is one of the best that has been proposed for arresting the progress of the disease.

ALTHOUGH we have not much knowledge of the plants belonging to Mr. LINDEN, which are about to be sold by auction, we are able to state that among the collection are many fine things. The *Uroped* alone is one of the most extraordinary of known Orchids, having tails to the flowers more than two feet long; *Sobralia dichotoma* is by far the finest of that genus. *Eriopsis biloba*, called in the catalogue by its second name of *rutidobulbon*, is a good plant, and rare. Some drawings that accompany the plants appear to represent charming species, in the way of *Houlletia*, *Myanthus*, *Odontoglossum*, and *Oncidium*; and also a new white-flowered genus, unlike anything yet known to botanists. The present opportunity is a capital one for securing novelties for the exhibitions in 1851 and 1852.

HOW TO MISMANAGE A GARDEN.

CHAPTER XI.—Tools may be made use of, as well as anything else, to show mismanagement; indeed, it may be taken as a rule that one of the best possible ways to turn out the worst possible work is to make a bad use of implements.

The approach of the great season for digging and trenching, and cutting and pruning, and felling, makes it desirable that no more time should elapse without the great rules for doing the worst with garden-tools being made intelligible to the meanest apprehension.

As to the pruning-knife: in the first place, take care it is always blunt; there are many advantages in bluntness. If sharp, it may cut your fingers; if blunt, it won't be so likely. Then, a blunt knife suits a clumsy hand; for some dexterity is required in using a keen edge, and none is needed with a dull one. You may hack with the one, and that takes time, and gives you an opportunity of considering how your cut is to be placed; but you must be decided with the other, for the knife once put in action, the cut is inevitable; and a bad manager cannot be expected to know how or where to cut without trying three or four times before he makes up his mind.

A blunt knife shows that a man has, at some time or other, been using it; but if it is always sharp, a suspicious master may fancy it is only kept for show. Besides, it gives him a chance of showing that he knows how to sharpen a knife; and it is certainly remarkable how a mismanager sets about that. You will see him rubbing away upon the whetstone, always drawing the blade backwards and polishing the sides with wonderful care. He knows better than to draw the edge towards him; or to keep that which is to cut in contact with the stone. He will tell you that if he does so he will rub off the edge, *in course*.

As knives are intended for use, a clever chap will use his pruner for as many purposes as he can turn his hand to; a weed-grubber, a cheese-toaster, a pot-scraper, a wire-cutter, are all instruments for which the pruning-knife may answer; and if, afterwards, it cannot be made to prune, at all events it has been made to grub, and toast, and scrape, and cut wire.

Then again, you should never have your knife about you; it is absurd to expect that a gardener should always carry a pruning-knife; no doubt he always wants it; but that is not to the purpose; it may do well enough for good managers, but a bad manager scorns such carefulness. The bad manager always carries his pruning-knife in his great-coat pocket, or in his jacket pocket; for this very good reason that, as he generally leaves his great coat at home, and very often takes his jacket off when he goes to work, he is sure not to have a knife when he wants one. Thus he has the chance of a gossip with his wife or somebody else when he goes to look for it. Old-fashioned gardeners prefer keeping their pruning-knife in their breeches; be

cause, as they seldom work without that garment, they are certain not to leave their knife behind them. But who would be so ungenteel as to carry a knife in his inexpressibles? Good managers may if they like, but a man of spirit, and a genius into the bargain, scorns such vulgarity and old maidishness.

What has been recommended for the pruning-knife should also be followed with other tools. If you have a mattock, be sure that it is put by blunt with wear, so that when you want it you must wait till it is fresh pointed. In this way labourers get a bit of a holiday, and you yourself have time to consider well how the mattock is to be used. In like manner your rakes should always have their teeth out, your spades be broken at the corners, and your scythes unset. As to scythes indeed, if they *must* be used, be sure to have no scythe stones, and no wipers; never roll the Grass before mowing; never sweep it clean of stones that chance to be there; but, on the contrary, hack the Grass, and score it well; break the scythe edges, damn the stones, and take great care to blame everybody but yourself. No doubt it *is* shameful that the Grass should be tough, that the children should throw gravel on it, that worm-casts should blunt the edge of the scythes; the worst of all is, that there is no help for such things. Good managers may provide against them if they like; but you will, no doubt, think with all other bad managers, that it is much easier to swear at them.

I was going to give you some advice about digging; but, upon the whole, I think you have enough for this turn. *Κῆπουρος.*

THE PHILOSOPHY OF FORCING.

A distinguishing feature in modern horticulture is the fact that principle is permitted to guide practice. To such must be attributed the rapid advances in every department of gardening, which the last quarter of a century has witnessed. There is a very startling fact for that now happily almost obsolete class of men, who treat horticultural literature with disdain, and scientific deduction, bearing upon their art, as mere toys for the scientific, in the circumstance that with the growth of garden literature, with the circulation and interchange of opinions, by means of the *Gardeners' Chronicle* and other periodical journals, simultaneously have spread better systems of cultivation, and more extensive knowledge of the capabilities of plants. By their aid a new fact becomes the progenitor of others. An idea conceived in one part of the kingdom, no matter how remote, is subject to the scrutiny of thousands of readers; its merits are tested and analysed, its real advantage or defects are soon ascertained, and the results become the property of all who watch the progress of the art and philosophy of gardening.

The dissemination of principles is the peculiar province of the literature of any science. He who would learn practice from them, to the exclusion of that physical exertion which perfection in any art or science ever demands as a tribute from those who would attain perfection, would most assuredly reap disappointment.

I propose to glance at the physiological and other principles upon which successful forcing must ever depend; and, by way of commencing at the beginning, it may not be amiss to define what really is the horticultural signification of the word forcing. Every plant requiring artificial heat cannot be considered as being forced, even though fruit should be the ultimate object. The imitation of a tropical climate must not be considered forcing. The latter I define to be the production of fruit or flowers at unnatural seasons, by natural agents artificially applied. And although the mere cultivation of tropical fruits involve much that is common to forcing, it cannot be considered as identical.

Adopting then the definition as given above, we shall find that the whole series of operations commenced in bringing about the ultimate desired result, may with propriety be divided into two distinct classes. The one I shall term the *preparatory* process, the other the *developing* process.

It is a law in all organic combination of matter, whether simply organic or animal, that each process in its development is dependent for its healthy action upon some *previous* process in the chain of progressive life of the individual. It is evident that by tracing this principle in its retrograde aspect, we ultimately arrive at the source of human penetration — a first cause. With this, the present inquiry has nothing to do. The principle being established I shall proceed, keeping it in view only as it bears upon the subject under discussion. And looking at it in its various aspects, the whole paraphernalia of mechanical operations involved in the routine of a forcing campaign is presented to us. Healthy roots, root pruning, luxuriant wood, laterals, summer pruning, in fact every operation which has the remotest influence on the constitutional or incidental vigour of the plant operated on, becomes a matter for grave inquiry. In the present state of physiology—admired though it may be—we know little of the action of external influences upon the vital principle of plants. We know nothing of its nature but by its effects. There can be no question but that the study of the influence which external circumstances exert upon the vital principle of plants is as important in the higher branches —aye and the simpler too—of horticulture, as that of the relation between the body and the mind of man is to the metaphysician and the human physiologist. But hitherto we have only regarded it with concern, in proportion to the effects produced. We must go beyond this. The rapid advance of scientific attainments amongst those who have the best opportunity of making observations, and of profiting by them, assures me that we shall do so. The progress of mental attainments may not inappropriately be likened to the physical accumulation of a snow-ball—the more it accumulates the more rapidly does it accumulate. Let any one look back from the present horticultural eminence obtained by our best gardeners, and what may they not expect of the future? *G. L.*

BRITISH SONG BIRDS.

It will be essentially necessary, before entering in detail on the proposed "Treatise of British Song Birds," to make a few preliminary observations closely connected with the subject. It is worthy of note, that there is scarcely a family, high or low, rich or poor, whether residing in town or in country, in which some one species of our feathered songsters is not to be found domiciled. From boyhood, nay almost from infancy, upwards, there exists in most of us an innate propensity to keep a bird. There is "companionship" in the very thought—a feeling of comfort, essentially English. How very many of us there are who can vouch for this fact! It becomes, however, a matter for serious consideration how these little prisoners are treated, when placed in confinement, and committed to our tender care and keeping, without the possibility of assisting themselves. With some, indeed, it is a question whether it be strictly lawful to keep birds at all, in confinement. The question, certainly, does admit of disputation; but allowing it to be lawful, there is at least entailed on us a serious and an indispensable duty to make them forget, so far as kindness can do so, their privation of liberty. This *I* have ever studied to do; and, in most instances, I would fain believe, successfully. I regret however to say, that my observation has led to the discovery of many acts of barbarous cruelty practised on these innocent creatures; arising, let us hope, not so much from an unfeeling heart as from a culpable want of due consideration to their necessities. Many people are apt to imagine, while viewing the occasional activity and sprightliness of their little caged favourites, and while listening to the melody of their tiny voices, that they are in the enjoyment of perfect health and happiness. They take this for granted. Many birds, however, though they sing, are still very far from being happy. There is a plaintive note as well as a joyous note. My ear could detect either, in an instant. Some birds convey the state of their feelings by a remarkably singular note, a note which is totally different at other times. I have known a bird warble delightfully, but ominously, a few minutes only before his decease. Like the swan, he has sung most sweetly at his death. As the strain ceased, he fell lifeless from his perch. His heart had burst. On looking into the cage, I have found my suspicions verified. From neglect, either Dicky's food has been exhausted, or his water, from carelessness, has been inaccessible. That "last" eloquent song of his, was a bitter reproach to his hard-hearted master or mistress!

I cannot help thinking, and I wish to be very emphatic on the point, that no persons should ever attempt to keep birds, or allow their children to do so, without their being what I call naturally fond of them, and, at the same time, themselves of a kindly disposition. To entrust birds to the care of a thoughtless child, a servant, or an indifferent person, in one's absence from home, unless under very particular circumstances, is to yield them up to almost certain destruction. Servants either cram their troughs full of food (sufficient to last a week) with a view to save trouble, or, by never changing their water, they allow it to become corrupt. In the former case, the hull of the seed which is eaten, falling on the top of the residue, prevents the birds obtaining a fresh supply; whilst, in the latter, the birds become poisoned by putridity. I am sorry to say, adults are frequently quite as much in fault as children in this matter; too often more so; for birds are not unfrequently killed by children through an excess of attention, having many things ministered to them quite unsuited to their animal economy. They are also taken out of their cages to be nursed and "petted"—a horrible practice; when the heat of the hand and undue pressure on their body causes their death.* Why, let me ask, should we be thus thoughtlessly, thus continually cruel; when five minutes of our time every morning will, in many cases, be amply sufficient to make our favourites both comfortable and happy?

These little creatures, if we would narrowly watch them, possess the most singular attractions, exhibit the most romantic attachments. Not a movement of their master or their mistress escapes their observation. They may be taught, easily taught, by affectionate care, to come out of their cages when called for, or to set on the finger and sing when requested. A simple movement of the head, or expression of the eye, will accomplish this; whilst the reward of a bit of hard-boiled egg, or a morsel of loaf sugar, will speedily cement an intimacy terminable only by death: the attachment of birds knows no other limit. I have verified this, times out of number; and have by me, at the present moment, a little army of "pets," who, having paid the debt of Nature, are now carefully and lovingly embalmed in glass cases—mementoes of many by-gone happy hours. I have rarely found, during a long experience of 25 years, any great difficulty in taming a bird, or, indeed, an animal of any kind. Instinct, on some occasions very closely bordering on reason, unerringly teaches the lower order of animals to discriminate who are their friends, and who are their enemies. This is demonstrable by the extraordinary familiarity, apart from all fear, which some birds and other animals exhibit when in the presence of their masters or mistresses, on whose fingers I have known birds to sit and sing with the most perfect confidence.

I was much struck the other evening, whilst visiting the Cyclorama, in the Regent's-park, to observe, mounted on a stand, a large and very ferocious macaw; who, having been evidently subjected to a succession of annoyances from tormenting visitors, was ever on the alert to fasten on the first victim that should fall in his power. Unlucky wight! The ferocity of the animal was the subject of general remark. Whilst passing through the same room, in the after part of the evening, I saw the said macaw caressing the face of a gentleman with the fondest marks of affection, insinuating his head inside the gentleman's waistcoat, and giving other most extravagant tokens of regard. It was his master!

Apropos of these little endearments. I remember, some years since, holding an argument with an "unbeliever" about the power I possessed of taming animals. I pretended, indeed, to no particular gift or mode of fascination; simply kindness. Mesmerism, at that time, slumbered; and we were in the habit of recognising effects without being able accurately to divine their causes. Science has, since, rapidly progressed; and we now view matters through a different, a clearer glass. *Mais révenons à nos oiseaux*, or rather *à nos poissons*. I offered my sceptical friend to procure a glass bowl, and to place in it a number of fish; undertaking to tame every one of them so effectually, within a fortnight, that they should one and all recognise me. This satisfied him, and he promised, if I succeeded, he would acknowledge my power. That was kind of him—very. To work I went. Thirteen sprightly minnows were introduced into a glass bowl, and I myself changed their water regularly every morning; removing them in a closely-meshed net, and tenderly replacing them when the bowl was again ready for their reception. It is not necessary to enter into particulars here, how I accomplished my purpose. A second Cæsar—"Veni, vidi, vici!" I was indeed "a Triton among the minnows." Within the prescribed time, every one of my finny friends had made my acquaintance; coming to the top of the water whenever I placed my head over the bowl, leaping some distance out of the water in the exuberance of their delight, and positively listening to me attentively whilst I whistled to them a lively air. More than this: when I placed one of my fingers in the bowl, each graceful inhabitant swam affectionately round it; rubbing his sides against it, and evidencing a degree of pleasure hardly credible unless witnessed. I converted the infidel, it is true; but I shortly afterwards lost the society of my little friends. They perished during the heat of that same summer. *William Kidd, New-road, Hammersmith.*

* A few months since, while making some purchases at the shop of a bird fancier, a ragged urchin rushed in and asked for a "penny bird." In exchange for his penny, he received a cock sparrow. Shortly afterwards a little girl entered, with scarcely sufficient clothes on to cover her person; her demand was for a "halfpenny bird." There was handed to her a hen sparrow. From the exquisitely-savage feeling of delight with which both birds were clutched by their respective purchasers, it would require little of the spirit of divination to enable one to predict their fate—torment, doubtless, and starvation; but they were "only sparrows!"

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

A paper was read by Dr. Lankester, from Mr. George Read, on *Ropy Bread*.—The author stated that the condition of bread called ropiness consisted in a change in the bread during its preparation, by which it becomes materially altered in its character, and instead of being readily broken, is tenacious and adhesive, and can be drawn into ropes without breaking. This disease of the bread, as it was called, appeared especially in London in 1846, and was not an unfrequent occurrence at all times. This condition of the bread is communicable from one batch to another, and the tendency to its production in a bakehouse can only be got rid of by thorough ventilation, washing the walls with chloride of lime, and planing away the surface of all wood with which the bread comes in contact during the process of its preparation. Bakers attribute it to various causes—to German yeast, bad flour, wet harvests, &c., but it frequently comes on when none of these circumstances exist to account for it. It is principally during the summer months that this disease is most prevalent in bread. In winter it never occurs. I also find that close bread, such as that made by housekeepers (which is seldom perfectly fermented), and that which is not sufficiently baked, turns more speedily ropy than well fermented and well baked bread, and that bread made from gleaned Wheat that has become damp by laying in the field soon turns ropy. The first change which the bread undergoes is a peculiar sweetness; and when the disease is very active, the whole substance of the loaves becomes as sweet as any common sweet cake. After this the bread rapidly decomposes, becoming, firstly, a tenacious kind of gummy or glutinous mass, giving out a fetid smell, and when made with Dutch dried yeast, the smell of the yeast is most particularly developed. A person in the west of England, whose

bread was very much affected with the disease states, "that in three days it was like a mass of slime." On examining some specimens of diseased bread with a powerful microscope, the author found that the whole of the cellular portion of it was destroyed, and its appearance was that of a peculiarly white luminous substance, somewhat resembling the granules of starch. In one or two of the specimens examined, and which had been dried by the baker in order to be enabled to sell it for pigs' food, and had afterwards been placed by him in an outhouse, it was found to be completely covered with fungi, every terminating stem having a fine well-formed fruit, somewhat resembling an Apple, and which appeared, from one of them that had burst, to be full of seed, so small as not to be visible to the naked eye. It was the opinion of some of the scientific gentlemen who were consulted that these seeds are carried about by the atmosphere of the place, and serve to propagate their species in whatever substance is fitted to receive them. This may, in some measure, account for the bread getting from bad to worse, and also for the singular fact that flour, which will produce ropy bread in a bakehouse where the disease has become established, if taken to another bakehouse that is free from it, and manufactured, will not be at all affected with the disease. Before closing this paper, there are two or three other points which I consider it necessary to mention, which is, that some old bakers state that the disease is more prevalent in bread after wet harvests than at any other time, and some of them consider the disease in the year 1846 to have been in a great measure caused by the releasing from bond a large quantity of damaged corn, through the cessation of the Corn law at that time. The state of the atmosphere and the yeast have each their share in producing the disease. — A discussion ensued on the reading of this paper. Many members were aware of the existence of the disease. One gentleman attributed it to a peculiar form of fermentation, in which the ordinary changes which take place during the baking of bread did not take place. He thought the fungus a result of this fermentation. Mr. Peach had often seen bread in this condition, and thought it arose from imperfect baking. It was more common after wet summers, and he had observed that it was much more frequent in the west of England than in Scotland.

Tuesday, *August* 6.—In the Mathematical Section a paper was read *On a Tissue Woven by Caterpillars*, by Mr. J. Dennistoun.—In the early part of this century there lived at Munich a retired officer, Lieut. Hebenstrait, who amused himself by experiments on the means of giving consistency to the gossamer produced by caterpillars, which is occasionally seen blown about in flakes over the fields in Germany, and he was at one time sanguine of rendering it available as a material for ladies' dress. It is said that his plan was to prepare a paste of Lettuce or other leaves beat up with butter, and, after spreading it thinly over a smooth surface of stone or wood on an inclined plane, he placed at the lower end a number of chenilles or caterpillars of the proper species. These animals gradually ascended the incline, devouring the paste, and depositing as they proceed a sort of tissue until the whole surface was uniformly covered with it. He is reported to have produced open work designs by drawing the pattern with a hair pencil dipped in olive oil before the animals begin to work. These I never saw, but I have seen one veil on which were some letters exactly resembling a watermark on paper, the secret of which I do not know. The inventor pursued his experiments with great secrecy, in the hope of turning his invention to valuable account; but finding this impracticable, it appears that he produced but very few specimens, which are now preserved in various museums on the Continent. I have seen two besides my own, which I procured at Munich, in 1837, after having advertised for it several months. The objections to using this tissue seem to be chiefly its exceedingly flimsy quality, and its very adhesive properties, which render its management and preservation extremely difficult, attaching itself closely even to the smoothest surfaces, from which it can be separated only by the breath. My veil is about 42 inches by 24 inches. One of 26½ inches by 17 inches is said to have weighed only 1½ grain. Another containing 9 square feet is mentioned as weighing 4⅓ grains, while the same surface of silk gauze weighed 137 grains, and of fine lace 262½ grains. It would seem that the art was in some degree known at an earlier period, and occasionally practised in convents, where coloured drawings on small bits of it are said to have been made. I have seen in all four of these on the Continent, and two or three on which impressions from copper plate had been taken,—always of sacred subjects. One of the drawings is in my possession, about 7 inches by 5 inches, executed apparently in the last century, and I have seen one dated about 1770. This beautiful tissue was unfolded to the Section by Mr. Dennistoun and Sir D. Brewster. It was rather more transparent than the finest lace veil, but it floated about with every slight current in the air of the Section-room, after a manner quite its own.

In the Geological Section, Prof. Parlatore, of Florence, communicated an account of the discovery of fossil plants, apparently carboniferous (Pecopteris arborescens and Annularia longifolia), in the Verrucano, a sandstone rock, inferior to the real Oxfordian limestone, and hitherto considered unfossiliferous; they were found by Prof. Meneghini and Prof. Paolo Savi, of Pisa.

VILLAGE EXCURSIONS.—Letter III.

I have found it difficult to keep my promise of giving your readers details for the management of village excursions. On reconsidering what I had intended to send you, it appeared to me far too minute. I have therefore condensed my materials, and shall merely glance at some of the topics I had intended to discuss more fully.

Cheap excursion trains are admirably adapted for enabling many persons to see a little more of the world than they otherwise could; and thousands are availing themselves of the opportunity. In the miscellaneous crowds congregated on these occasions, some persons are found to end the day, if they do not entirely pass it, in a way which inclines us to believe they had far better have staid at home. It is when some particular plan of proceeding has been properly organized, that the best results are to be expected from this modern method of seeking recreation. Since I sent you my first letter, I have been present, on two separate occasions, when excursion parties have proceeded to Ipswich from towns at a distance, directed by programmes which had been previously issued to regulate the proceedings of the day. What I am about to advise respecting village excursions cannot be equally applicable to parties proceeding from towns; but it may be worth considering whether these may not also be so arranged as to offer an occasional opportunity for encouraging, through the means of social intercourse which they afford, mutual good will between all parties, as well as agreeable and instructive modes of recreation.

In setting forth the *agenda* to be taken into consideration for the due organization of a village excursion, first of all, a locality should be selected which possesses features of a different description from those with which the labourers are familiar. A visit to a town, or a trip to the sea-side, where they are beyond the smell of salt water, may be suggested. It is very important to secure the co-operation of some persons, who are friendly to such proceedings, residing near the locality to be visited. They will make arrangements which it would be otherwise difficult or impossible to complete, and secure an apartment where the women can take off their bonnets and rest themselves, for some of them will be sure to get over-fatigued. In our excursions, we have always been more highly favoured than most parties are likely to be, by the amount of trouble which has been bestowed upon us; but I am persuaded there are few districts in England where there may not be found some one heartily willing to respond to such a call, even if it were to be made through the local papers.

In forming a village party, nominate a good "nucleus" from among the labourers. The members of a benefit club, or some other laudable society, are likely to afford the best opportunity. These may be invited to double or treble their numbers from among the residents in the village, it being understood that each will respectively be responsible for the good conduct of whomsoever he may nominate. A few of the rougher diamonds may thus be incorporated, and, being put upon their best behaviour, will very likely find out there are more satisfactory methods of enjoying life than those to which they have been accustomed. A general invitation to the farmers and others, with due respect to the numbers of which the party is to consist, will secure the countenance of most of those who are likely to be pleased, either "with themselves" or with those whom they see happy about them. A village party of 200 or 300 thus constituted, appears to me perfectly manageable; but if a much larger number are to be conducted through a town, there might be great risk of some of them becoming regardless of the prescribed arrangements; and, without active coadjutors, inconveniences or irregularities might be the result.

The price fixed for the tickets should be understood to cover all the expenses of the excursion. There should be no extra charges for refreshment or sight-seeing. The expenses should either be fully met by the money raised upon the tickets, or (as I would advise) partly defrayed from a fund raised for the purpose. The labourer, at least, should feel perfectly satisfied that he has received more than his money's worth. It is good policy to circulate an account of what the day's expenses have been, so that every one may see how the money has been spent. All unnecessary expense should be carefully avoided, with due respect to a liberal disposal of the funds. People get tired of costly excursions; and what is a mere trifle to one person on such occasions, is often a serious matter to another. Whatever may savour too much of the patron, and too little of the companion, should be avoided. A few donations will keep down the cost of the tickets, which should be the same to every one, as well as the fare to be provided. No extras should be allowed for gentlemen and ladies!

It may be suggestive to those who may be rather sceptical on the score of expense, if I here insert the items of the charges incurred this year for the excursion to which you have directed the attention of your readers.

	£	s.	d.
To carriage, by waggon, cart, tumbril, or other conveyance, from Hitcham to Stowmarket	0	0	0
N.B. Some of the farmers kindly lent their waggons, and those who used them subscribed about 2*d.* apiece to pay the drivers for their trouble and expenses.			
Railroad, Stowmarket to Ipswich	7	10	0
Steamboat, Ipswich to Landguard-fort	5	0	0
8 stone of flour, home-made up (with the requisite ingredients) into plum-cakes	1	8	0½
The rest of the provisions, procured from Ipswich, consisted of—			
8 stone of best bread	0	14	8
Carried forward	£14	12	8½
Brought forward	14	12	8½
32½ lbs. of cheese	1	0	4
6 pints of butter	0	6	6
Barrel of ale (less 3 gallons not wanted)	1	13	0
Concentrated lemonade, at wholesale price	0	10	0
A few extras to parties helping	0	12	0
Printing notices and tickets	0	12	0
Total expenses to be met	£19	6	6½

Part of the cakes were consumed on board, and the whole was just enough for a frugal repast on the green sward by the sea-shore. Two large baskets of shrimps were presented by two friends; ice cream sufficient for every one to have a taste was manufactured on the spot; two dozen of ginger wine allowed of a mouthful, to qualify the unwonted sensations produced by the ice; a large bag of nuts and walnuts was emptied, in a scramble, to settle the wine. For all which excesses I felt myself no way responsible, as they were extemporised by kind friends who had joined us from Ipswich with their own stock of provisions. We all shared alike in the pic-nic, and thus a few crumbs of superior plum-cake were obtained in barter for our more ordinary fare.

It must not be forgotten that we lingered one minute too long, and thus missed the train which would have brought us back unhungered, and without additional calls upon the commissariat. In our dilemma we were tossed from the horn on which we had fallen, into the grounds of one of the friends who had accompanied us. Here we were regaled with enough to stay the stoutest appetite till midnight; but for these exceedings, also, I felt no way responsible. If the party met with more than they had bargained for, I will venture to say it was not more than what our friends considered their good behaviour had deserved. As those who treated us so considerately can appreciate the feelings they have awakened in the agricultural labourer, I shall not shame them by recording the very words (more than once or twice repeated) in which those feelings have been expressed to me. "If Mr. H. did not sometimes take us out to a distance from home, we should not have known that there were such gentlemen in the world as * * *." *J. S. Henslow.*

GARDENING IN HOLLAND.—No. V.

If I was somewhat disappointed in the Orchids in the Leyden Garden, there were two houses of Ferns that amply made amends, for their beauty and health ran concurrently. Amongst them I was particularly struck with a noble Angiopteris erecta. It is a magnificent thing—as were the plants of Goniophlebium Reinwartii, and Marattia sylvatica. I have long ago said no garden establishment ought to be without Orchids; and I now say that none ought to be destitute of Ferns. I consider the degree of excellence in a gardening establishment is tested by the presence or absence—by the ill or perfect culture of these two families. A garden without them is like a king without a crown, or a church without tower or steeple. All young cultivators are captivated with Geraniums, Chinese Azaleas, and such plants as have colour and a repetition of the same forms; but as the love of gardening increases, and the mind becomes more expanded, he gradually seeks diversity of form; he would cease to make colour and uniformity the points of perfection, but would revel in the inexhaustible variety that Nature, with an all-abounding hand, has so liberally surrounded us with. Again, those who merely culture Geraniums, can extract but little pleasure from them for more than half the year, and in the winter when flowers are denied us from without, least of all; but our houses of succulents, Orchids, and Ferns, are of all enduring interest. Let me not be mistaken; I would not have my garden without Geraniums and all common flowers, but if I had but one house, as is the case with many of my friends, it should not be devoted to Pelargoniums, for a mixed selection of Cape and New Holland plants, with a shelf for Pelargoniums, would afford infinitely more pleasure than a greenhouse, where the one genus (and a very small portion of that) is paramount.

Heaths are not generally well managed upon the Continent. In France, they tell us the sun is too scorching, and the air too dry to grow them perfectly; but, surely, these causes would not pertain to Holland; yet I nowhere saw them as our growers have them. The set at Leyden is the best I had met with, and in the best order. They were sunk in the open border, a board being placed in the front to support the plunging materials. This the more delicate growers demurred against; and another cause of failure appeared to be the want of attention to the repotting them at the precise time when they required it. Amongst the greenhouse plants, I was much gratified to see a number of Proteas and Dryandras, plants that have greatly diminished within the last 25 years at home. All the greenhouse plants were plunged in the manner described for Heaths, and there is a very good collection of them—small plants, and well looking.

The plants without doors must next claim our attention, and here I found a great number, and better arranged than I was prepared for. Botanic gardens are not usually made so as to become of interest to casual observers, but for botanists only. Here, however, is an exception, for the plan is such as to satisfy each class.

I will now briefly describe the garden. It consists of little more than 2 acres; is bounded on one side by the canal I had the evening before been transported upon on the other sides the town would have been visible but for a good screen of shrubs and trees. This belt of trees is at one or two places broken, to admit views of

the church and the water, but at other places excludes the distance, and keeps the eye upon the arrangement of the plants below.

The front of each part of the outward and inner shrubbery is occupied with a regular set of herbaceous plants, illustrating De Candolle's system of botany; and, in addition to this, at one part is found a scientific arrangement of plants used in medicine. This part of the gardens reflects the highest credit upon those who superintend it, for the specimens are well grown and named correctly, generally, except where a specimen has been lost, and some adventitious plant been allowed to occupy its place; but this was of rare occurrence. The Grasses, though not numerous, were very interesting, on account of the good selection of species. I here saw the Spelt Wheat in blossom, and a variety of black Barley, very dwarf and in two rays, that was said to have been obtained from Siberia; the latter was new to me, but not likely to be of value for agricultural purposes. There was a whole bed of Liguria japonica, whose shining heart-shaped leaves were very conspicuous. The whole length of the winding walks was edged with turf, which met into the Grass upon which the Aloes were placed which were noticed at the entrance. It is a pity that Grass should have been used, for it is never so treated as to form a velvet carpet, as with us, although for the Continent this was as good as any I had seen. The planning of this garden is decidedly English, as exemplified in the curved walks, and also in the attempt to alter the levels, this latter being considered "a high crime and misdemeanour" amongst Dutch gardeners. In my gardening matters I had more difficulty on this subject than on any other, for they declared if a foot of level was altered, the water would occupy it; and if a foot were added to the elevation, that nothing would grow, on account of the drought. So wedded are we to those practices we have been accustomed to (they have grown with our growth), that we cannot believe that any other system can be right. Before quitting this valuable and well-looked-after garden, I will briefly notice a few of the specimens in the open ground that attracted my notice.

There is the largest specimen of Weeping Beech, of the variety we raise by grafting, that I have ever seen. It must be 35 feet high, and some of its branches springing from 20 feet, curve gracefully to the very ground. From this specimen I perceived that it might, at certain places, be made very effective. Here also is the largest and best formed tree of Pyrus salicifolia that I had seen; when grown fully in this manner, it is well calculated to produce a light on trees of ordinary kinds that would from situation be commonly dark. I must not omit the notice of a very handsome Salisburia biloba, at least 60 feet high, and 2 feet diameter of stem, at 4 from the ground. It is still in a good growing state.

Here, also, is a Paulovnia imperialis 25 feet high; it has for four years shown its blossum buds; but they are formed too late in the season to expand. The tree is worth growing, nevertheless. Against a wall the Bignonia grandiflora was growing and flowering profusely, and near it, on the border, were two varieties of Belladonna Lilies in flower, a full month earlier than they expand in Canterbury.

I enquired if any trees existed that had been planted by eminent botanists, and was told that the Fraxinus ornus, planted by Boerhaave, had been blown down about two years ago, but that a Lonicera, set by Linnæus, still existed; it had a stem 1 foot diameter, which had been strapped up, and possessed no interest except from im who planted it.

Two very handsome Pistacia lentiscus were grown in large tubs, and some Pomegranates, with curiously twisted stems of large size, riveted my attention. In days gone by, tricks of all kinds were performed upon plants to produce an unnatural growth; and I cannot doubt but that the singular appearance of the Pomegranates was occasioned by twining two or three stems together. I left this garden with a feeling of veneration for its founders, and a high respect for those under whose direction it is at present conducted.

I have noticed that in the planning, an eye has been given to the English mode of laying out a garden. I may here note, that there are many indications of change of style in the smaller villa gardens; but, in general, it consists of an attempt to engraft our mode of making beds upon the skeletons of their straight canals of water, and avenues of trees; and as might be anticipated, not with the happiest results. I saw many places where better things might have been done by throwing the canals or ditches into lakes, and thus raising some portions of the borders; but, then, turf is essential for this kind of gardening, and with a few exceptions, a Dutch gentleman will not expend labour upon cutting a lawn—it must produce at least one crop of hay annually.

Notwithstanding that the country is so flat, I in no instance saw this defect compensated for by grouping different sorts of trees and shrubs that grow different heights, so as to effect by trees what was denied by the surface. Another serious drawback to the making a good garden is, that stone or gravel is not to be found wherewith to form the walks. They must then either remain in sand or be paved with bricks, as are the general roads—either but a poor substitute for our good binding and well-coloured gravel. But, in spite of all this, I saw very many places that, if committed to an English landscape gardener, might have been very materially improved.

I must here conclude my notices on the gardens and gardening of Holland—brief and imperfect as they necessarily are—I yet hope they will be found of interest to some of your readers, who estimate truthful impressions of what was seen and felt, rather than the more elaborate effort cooked up, from imagination, with literary skill, till it becomes smooth and polished as Parian marble. I have notes also upon pictures and museums, &c., but they belong more properly to other journals. *W. Masters, Exotic Nursery, Canterbury.*

Home Correspondence.

Cure for the Vine Mildew.—I have here under my charge a rather large late Vinery, with a fair crop of fruit of average quality, and I believe that in the month of July last there was not a single bunch of Grapes in the house upon which mildew could not be found; a great number of the leaves was likewise attacked, and also the bark of the young shoots. Such being the case, my first thought was to apply sulphur, about the efficacy of which I had little doubt; but still I did not like the idea of marring the beauty of the berries, and rendering the fruit disgusting in the eyes of my employer, long before he would see it at table. While reflecting on this, and knowing sulphur to be both volatile and indestructible, it occurred to me that the best and most simple mode of applying it would be by exhalation from the flues. In the evening, therefore, when the house was closed, I caused the flues to be made pretty hot, wetted them well, and then sprinkled the sulphur on them. In a few minutes the house was filled with warm steam, strongly impregnated with sulphur. I watched the operation, until I saw that the cold surface of the berries had condensed so large a quantity of the steam, that a heavy dew upon them was perceptible. This at once arrested the progress of the mildew, and within the course of a few days I had the satisfaction of observing a change in its colour, from its natural whiteness to a dark brown. Since that time, the only parts where it has again appeared, has been upon the newly expanded leaves of the lateral shoots, few, if any, of which have escaped it; this has given me repeated opportunities of testing the experiment, and in each case a similar result has followed. Of course I need not inform any gardener that great care is necessary in this operation, it being well known that the leaves of Vines, as well as of other plants, are susceptible of receiving great injury from an immoderate quantity of volatilised sulphur. I wish to add that should any of your readers feel disposed to favour me with a visit, I shall feel very happy in showing them the fruit alluded to, with the still visible spots left by the mildew upon the berries. *W. Sherwood, gr. to J. R. Mills, Esq., Englefield Green, Surrey.*

Hadoes.—I lately saw some roots which were brought from the West Indies, called "Hadoes." They are much appreciated in soups, and I was informed that they may be grown in England. Will any of your intelligent readers, who may be acquainted with the plants, kindly give a botanical and general description of them in your next *Chronicle*, with the mode of their cultivation, and a recipe for their use in cookery? *φιλος.* [These are Eddoes, the corms of Colocasia; acrid until boiled in two or three waters, and then eatable like Turnips or Potatoes.]

South Australian Potatoes.—At this time, when the Potato disease is occupying so much attention in England and on the Continent, the following paragraph (from the *Adelaide Advertiser* of May 30, 1850), relative to the very astonishing yield of Potatoes grown upon my brother's estate at Balliparinga, South Australia, may be deemed interesting, both in a commercial and scientific sense. I will secure you specimens of the Potato (2 lbs. each) from the ground. *J. Bailey Denton, Gravely, Stevenage, Herts.*

"We have reported the arrival of the Breeze from Rapid Bay, with Wheat and Potatoes. Of the latter were 151 bags shipped by Mr. Denton, which have been promptly sold at 6*l.* per ton, being of excellent quality. Samples of this very superior crop lie on the table of the Exchange, weighing 2 lbs. each, accompanied by a small bag of the soil on which they have been grown. There are some features of considerable interest connected with this shipment, seeing the importance to the community of an adequate supply of good Potatoes. The product of the above district is most abundant, and the quality is good, there being no tendency to rankness, or hollowness, in tubers of the extraordinary size exhibited as above. A large assortment of bad, and, in some instances, of deleterious Potatoes finds sale in Adelaide, and the sure stimulus to improvement in an article become essential to Englishmen is successful competition, and this will, we trust, be found on the Rapid Bay Potato fields."

[Since the above was in type we have received the following from Mr. Denton.] I sent you on Thursday last an extract from a South Australian paper, referring to some Potatoes grown by my brother at Balliparinga Rapid Bay, thinking you would deem the fact of a crop of several acres being uniformly so remarkably fine in quality, quantity, and size (and my private letters fully confirm the fact), as of some import in considering the question whether the Potato will cease to be a vegetable of European culture. For my own part I have watched with considerable interest the changes to which the Potato has been liable, and have read all that I have met with on the subject, and my experience (which extends to many descriptions of experiment) satisfies me that the distemper is merely casual, and arises from atmospheric influences, having more or less effect according to the length of time for which they prevail, and always commencing with the upper growth. This has been signally proved to be the case this year. All my Potatoes, both in my garden and on my farm, became in the middle of August suddenly black in their foliage and stalks (which more rapidly withered than in any year previously), and I feared the entire loss of my crop. Those in my garden I ordered to be taken up instantly, and I have lost about 1 bushel in 17; those in my farm were necessarily obliged to be left until after the corn harvest; they have now been raised nearly a month, and I do not find 1 bushel bad in 300. If I had judged from appearance, and the experience of past years, I could not have expected one-fourth to be good. And this has been the case generally throughout England and the western part of Europe. I found at Antwerp that about the same time my Potatoes showed blackened tops, the price suddenly rose in the market 1 fr. 25 cents per bushel, and a fortnight after the price at the same place was even lower than it was before the rise; and this was the case throughout Belgium and Holland. They say the quantity and quality of the crop were never better than they have proved to be. I do not pretend to be a chemist or a philosopher, and these facts make me regard all I have read and tried as nought. Here we find a very wide breadth of land in this country and on the Continent producing tubers as free from disease as they were 10 years back from beneath an upper growth so blighted in appearance that it was questionable with many whether the crop would be worth gathering; while at our antipodes the produce from seed derived from England (though of several years' seasoning to the country), is such, that I believe for quantity, quality, and size, never has any better been grown in any country in the world. *J. B. D.*

Champion of England Pea.—It may be useful to know that this Pea succeeds admirably as an autumnal cropper. I sowed a quart, by way of experiment, on the 7th of last July; I commenced sending them to market on the 21st of September, and I have sent them every week since. The crop, quality, and size, equalled—I may say exceeded—the same kind of Peas which I grew in the summer months, and far surpassed all other varieties sown at the same time on adjoining ground. *John Briscoe, Upton, near Birkenhead.*

Portugal Cabbage.—I once more beg leave to differ with you as to the statement that the Couve tronchuda does not heart; I again assure you that it does heart with me, not loosely, but as firmly as any York Cabbage in Britain. I will with pleasure send you some hearts of it, to convince you of the validity of my assertion. If you or any amateur gardener, however, wish for a small portion of the seed of either the tall or dwarf tronchuda, I will be most happy to inclose a paper or papers of each root. We do not cultivate this excellent vegetable for the midribs alone, as we do not consider them to be as good as Seakale, as has been often stated. But, decidedly, there is no species of Brassica can in any degree compare with it for delicacy and flavour when served up with rounds of beef, hams, bacon, or *profil de cochon. Mediensis, Ireland.* [We should certainly be much obliged by a specimen of this Couve tronchuda.]

Fall of Rain at Chiswick and Uckfield.—Such a great discrepancy exists between the quantity of rain fallen at Chiswick and Uckfield during the present year, that I am induced to forward a copy of my register to September 30, 1850, and also the average monthly fall of rain in this locality since the year 1842.

	Chiswick. 1850.	Uckfield. 1850.	Uckfield. Average of eight years.
January	1.43	1.47	2.32
February	.95	2.47	2.33
March	.13	.18	1.18
April	1.79	3.27	2.07
May	1.84	2.78	2.22
June	1.40	2.03	1.63
July	2.68	2.44	1.64
August	.97	2.37	2.63
September	2.35	2.62	1.99
October	...	...	3.95
November	...	...	2.66
December	...	...	1.96
	13.54	19.63	26.58

In Sussex, therefore, instead of there having been a deficiency of rain, the amount fallen has already exceeded the average by 1.62 inch, which being, however, so near the annual quantity, it appears reasonable to suppose that the fall of rain during the months of October, November and December, will not much, if at all, exceed the average. *C. L. Prince, Uckfield, Sussex, Oct. 14.*

Ripe Fruit without Leaves.—Peaches and Nectarines have produced ripe and well swelled fruit here, on shoots without any leaves above or at the fruit, and in some instances the wood was quite dead down to the fruit, some of the shoots had remained green, but without any appearance of leaves. The produce was as fine as that on any part of the tree, where leaves were growing above or at the fruit. The anomaly may in some measure be owing to the trees not bearing a full crop. Sufficient proof is offered, however, that fruit has the power in some instances of ripening without the assistance of leaves. *J. Dowell, Amington-hall, Oct. 16.*

[We do not perceive in what this proof resides.]

Browallia Jamesonii.—Has any one succeeded in inducing this plant to flower freely? When it first bloomed and was figured in the periodicals, great things were anticipated of it, but after trying it both in the greenhouse and in an intermediate house, I have been unable to obtain a single flower. I have treated it both liberally and on the cramping system with equal ill-

success, and I fear most persons are similarly disappointed, as I have never observed it mentioned as forming an exhibition plant. *N. W. G,*

Rockwork.—I observe that many of your correspondents are troubling you at all times about rockwork, not knowing how to go about it, from not reflecting that rockwork is like any other part of a garden—a picture—just as true pictures are as often rough landscapes as representations of more regular objects; but, as rockwork, like water, is as it were another element from garden beds, so ought its difference to be distinctly marked. Loudon's directions for rockwork are bad; it is quite wrong to see a Fern growing out of a glacier half its size, and so on, which must be the case where the Alps are imitated. The best place for rockwork is in water, or round it, in which case the shape of the water must not be regular, nor must any part of it be double the breadth of the rockwork. If the rockwork is in the water, this last may be regular, best round, with a broad moulded edging of stone or brick; and round this again a gravel path. This arrangement will allow all the water and rock plants to be seen together, and will save so much excavation in the pond. With regard to building it up, it must be in layers, as broken and various in thickness as you like; and large stones may stand comparatively isolated. A triangular mass in a round pond does best, the three angles very varied. No jet of water can be admitted in any rock-work. No water of regular shape or small size ought to be on Grass. *T. A. V.*

Summer Pruning the Vine.—When I questioned the propriety of Mr. Lovell's remarks upon growing the Vine "without stopping," he pitied my temperament, because it was active; I feel that I am privileged to pity his, because it is lymphatic. In your Number for August 3d, I asked for his routine; and surely sufficient time has elapsed to prove the practicability of his system, had he attempted it; but I doubt it. He says, both "Lumbricus" and myself have misinterpreted his meaning. I asked for his system, in order to prevent mistakes; but I suppose he has only a knowledge of the principle, and not the practical result of its application, which is contrary to his statement. In page 486 he remarks, "We practise certain systems, and then endeavour to establish a principle for so doing." Now, it is obvious that he has departed from that course in this instance, or my questions would not have so long remained unanswered. It may be a secret (perhaps worth knowing), but why stretch our imagination, and then leave it to recoil, uninformed, prejudiced, and distrustful. Give us indubitable proof that you have grown better Grapes without "stopping," than your predecessors have with stopping, and your talents will be praised. Give us your method, that we may also profit thereby, but lead us not from practice (the results of which are certain), by physiological conundrums, whose basis is your authority. Give us facts, that we may judge for ourselves; if we then attempt your suggestion and fail to realise such facts, you may then justly say of us, "those half formed witlings are numerous in our isles." *T., Southampton.*

Wintering Seed Potatoes.—When at Mistley-hall, in the autumn of 1830 or 1831, I stored away a few bushels of early round Potatoes; they were laid on the wooden floor of a fruit-room about 6 inches thick. When they began to sprout, an idea struck me that, if they were potted, they would come in earlier than if the shoots were pulled off them. The foreman, therefore, got orders to pot them. Upwards of 1000 small pots, called 60's or 4-inch pots, were used for the purpose, placing a tuber in each pot. They were removed to a cold glass house, where they received no water. Some time early in March they were turned out along the bottom of the south walls of a 4-acre garden. I had a large garden pot put down beside every plant, to cover the latter with, should frost come on. The result was a large and plentiful crop of very early Potatoes, at a time when they were fetching half-a-crown a pound in Covent Garden. I also gained prizes for early Potatoes at the Ipswich Show, for two or three years. Since the above period I have not allowed an eye to be picked off a seed Potato, and ever since I have been here (11 years), I have practised the plan of not allowing a Potato to grow during winter, but, on the contrary, I keep them dry and cool, and plant them shoots and all entire. In 1847 I sent 1200 lbs. to Covent-garden Market before the 19th of June; the money fetched was within a few shillings of 30*l.*, for the produce of 30 rods of ground. I have proved that by properly wintering the York Late White, and other late sorts, they can be ripened at least five or six weeks earlier than usual. A Potato wintered on my plan is strong and healthy, compared with one that has been allowed to expend its substance in producing useless growths. *James Cuthill, Camberwell.*

Fry's Sulphurator.—A description is given in last week's paper of a machine invented by Mr. Epps of Maidstone, for the diffusing of sulphur amongst Hop-plants, &c., effected with mildew. As my machine is mentioned, perhaps you will allow me to state, that shortly after I had the honour of first introducing my invention to your notice for horticultural purposes, I received a letter from Mr. Epps, requesting me to send him immediately the sulphuring machine which I exhibited at the Horticultural Society's Rooms on the 6th of August. Knowing Mr. Epps to be an extensive Heath grower, and thinking he had the mildew amongst his Heaths, to serve him I forwarded one as desired, begging that he would give me the benefit of his opinion of the contrivance, should he approve of it; but from that time to this I have not heard from him, neither had I the slightest idea that he intended to take advantage of my invention until I was informed that he had improved and registered the same. I have only to add, that the machine which I introduced was improved by myself and an ingenious mechanic soon after two or three of the original ones were manufactured, and the public will soon have an opportunity of judging of their respective merits. *George Fry.* [We have only to observe that Mr. Epps' machine is most essentially different from that which was exhibited some time since by Mr. Fry.]

Societies.

Horticultural Exhibitions in America.—We learn from a Montreal paper, that at the horticultural meeting lately held at Montreal, Dahlias were shown in great quantities, and very fine. "They were exhibited in patterns, in bouquets, in single stands, and mixed with other flowers." Various Verbenas, Asters, and Petunias, were also present, and there was a large number of Pansies. "The latter, as well as the Asters, had been made up in a number of designs." Cockscombs were remarkable for their "size and strength. One in particular had a stem nearly 2 feet high, and the comb must have been 10 or 11 inches in breadth." There were several plants of the red and yellow variety of this flower. Among vegetables there were Cabbages, Cauliflowers, Tomatoes, Beets, Turnips, Turnip Cabbages, &c.; and among Fruits: Grapes, Peaches, Plums, Apples, Pears, Melons, Cucumbers and Pumpkins.

The *Toronto British Colonist*, of Sept. 24, informs us that at the late agricultural exhibition held at Toronto, the following gardening produce was exhibited, viz.: Apples, Pears, Plums, Peaches (open air), Grapes (hot-house), Grapes (open air), Pumpkins, Squashes, Tomatoes, Broccoli, Cabbage, Carrots, white Celery, red Celery, Egg Plants, Blood Beets, white Onions, yellow Onions, red Onions, Salsify, white Turnips, white Beans, Dahlias, collections of Greenhouse Plants, Canadian Coffee, Water Melon, and Musk Melon.

Garden Memoranda.

Mr. Rivers' Nursery, Sawbridgeworth, Herts.—Few nurseries afford so much information on matters relating to general gardening as that of Mr. Rivers. An ardent lover of improvement in every branch of the business, he is continually trying experiments, the results of which are always interesting, and often highly instructive. Within the last few years he has erected several glass houses, in which not only utility, but cheapness of construction have been the objects aimed at. Some of these houses have only a Beech-hedge for the ends and back wall, in which stakes are placed for the support of the roof, while the fronts (not more than 2 feet in height) are left open. Under these circumstances a constant circulation of air is kept up throughout the interior of the house in which, although glazed with sheet glass of the cheapest and most common description, no scorching or burning ever takes place. One of these houses contained dwarf fruit-bearing trees of some of the finer kinds of Pears in pots; Coe's Golden Drop Plum, with its fruit inclosed in gauze bags, in which it will hang on the tree till December, or even later; and also a new Plum, named Reine Claude de Bavay, having a fine flavour resembling that of the Green Gage, but stated to ripen its fruit at least a month later than that variety, to which it will form a good succession. In the same house were likewise dwarf Apricots and Peaches, &c., all of which appeared to be in a thriving state, and the Peaches were producing excellent fruit. In other houses of a cheap kind, but closed at the back and front, &c., Vines were ripening good crops up the rafters, while Figs planted out on the dry border beneath and pegged down close to the soil, were covered with fruit in different stages of development. On the back border (for these houses have all a narrow sunk path up the middle, with a border on either hand) were Peaches and Figs, &c., in pots, in which they are intended to be kept permanently, and in a healthy fruit-bearing condition, by means of a system of root pruning and feeding with liquid manure. In another of these houses, but of a close and warm description, the culture of Orchids has been attempted with every prospect of success. We say prospect, because the plants are recently imported ones, and have been but lately placed in the house. The heating is effected by means of one of the brick Arnott stoves, figured at p. 51 of our vol. for 1846, it answers perfectly, being capable of supplying, as may be required, either a dry or a moist heat. In another part of the nursery where there is a warm bank, containing naturally an excellent Vine soil (very light sandy loam requiring no manure), Mr. Rivers is about to erect a series of these cheap glass houses, in which he intends to grow Grapes for Covent-garden market. One house is all but up, and the Vines are planted for others 18 inches apart. It is intended only to fruit every alternate Vine each season. Contiguous to this spot were Vines scrambling over a bank of stones facing the south-east; among them was a new sort called Prolific Sweetwater, whose size of bunch and berry would recommend it to a better situation. It was stated to set well, and was ripening fruit under a hand-light. Among pillar Grapes, of which Mr. Rivers has a great number, one called the purple Fontainbleau claims especial attention; for we will be mistaken if it does not prove a valuable cottager's Grape. It grows freely in the open air, and bears abundantly. The specimen in question had about 50 large bunches on it, which no doubt would have ripened had they had the assistance of a wall. Its fruit is said to ripen before that of the Burgundy. A few examples of this Grape have been sold, we believe, under the name of Muscat de Fontainbleau. Mr. Rivers possesses another acquisition, in the shape of what is called the large-fruited Monthly Raspberry; but this latter is somewhat better known. It produces fruit from the lateral branches which it puts forth from every joint, and in this respect, as well as in others, it differs from the Double-bearing Raspberry. Quantities of it are reported to have been sold in France lately, under the English name of Marvel of the Four Seasons. On a pathway in front of one of the glass houses, were some fine young plants in pots of the celebrated Stanwick Nectarine. They were grafted on the Peach stock. As regards Plum stocks, it has been found that this Nectarine will "take" on the Damas Noir, but not on the Muscle Plum. While on the subject of Plums, the following fact may, perhaps, be worth recording. Some years ago Mr. R. raised a seedling or two from the Précoce de Tours, and among them was one which was afterwards named Early Prolific. This latter has withstood the frost of the 3d of May this year, and has borne a heavy crop, while 200 other kinds of Plums, equally favourably circumstanced, have all failed. Near the Plums was a small plantation of the true Portugal Quince, which is the best of all the Quinces; and elsewhere, planted among Gooseberry bushes, were Cosford Nuts, worked on the clean stems of seedlings, standard high. In this state they occupy little room, are perfectly free from suckers, and produce, for the size of their heads, heavy crops. We also remarked the Double-flowering Furze, and the white and cream-coloured Brooms, worked standard high on the purple Laburnum. Many fine autumnal Roses were in bloom, and some account of these will form the subject of another article. *Sept.* 23.

Miscellaneous.

Varieties of the Ruby lipped Cattleya.—These magnificent varieties of the Ruby-lipped Cattleya are quite new, and at present among the rarities of horticulture. For the white one we are indebted to the noble collection at Syon; for the blotched sort to J. J. Blandy, Esq., of Reading. The Ruby-lipped Cattleya is that on which the genus was founded. It was first sent to Europe by Mr. Swainson, who discovered it in Brazil and used its stems as a kind of "dunnage" to set fast certain chip boxes of Lichens, &c., which he transmitted to Sir William (then Mr.) Hooker. Where he gathered it we are not informed, but we learn something precise on the subject from Mr. Gardner. This lamented botanist found it on the edge of a precipice on the eastern side of the Pedro Bonita Mountain, about 15 miles from Rio Janeiro, where it grew along with Vellozias, the Mackay Zygopetalum and Dipladenes ("Journ. of Hort. Soc.," vol. i. p. 196); and also on the Gavea, or Topsail Mountain, so called from its square shape, and well known to English sailors by the name of Lord Hood's Nose; "Travels in Brazil," p. 28. This plant has a pale lilac tint with a very broad rich stain of ruby red over-spreading all the front half of the lip except the very edge. Since that time large importations have been made from the Caraccas and New Grenada of a Cattleya with pinker flowers, of much larger size, the veins of whose lip alone were crimson, while the spaces between were yellowish or white, or both; some of them had crimson veins run together. Upon these specimens Sir William Hooker proposed to establish a new species, to which he gave the name of Mossiæ; and it must be owned that the peculiarities of the Caraccas plants seemed sufficient to justify that conclusion. We are however obliged to say, after a most careful comparison of large numbers of this Cattleya Mossiæ, that we can find no distinctive characters in it except size and colour. It would be useless to attempt an enumeration of the varieties that exist of this plant, unless for the purposes of a florist. We therefore merely present those now figured with the names of the White Ruby-lipped Cattleya (C. labiata candida) and the Blotched (C. l. picta.) The following account of the climate in which Cattleya labiata grows, furnishes cultivators with hints which they will readily apply to practice. "At this elevation (2000 feet) the climate is very much cooler than it is at Rio. In the months of May and June the thermometer has been known to be as low as 32° just before day-break: the lowest at which I observed it myself was one morning at the end of May, when, at 8 o'clock A. M., it indicated 39°. The highest to which it rose during the six months I resided there, was in the end of February, when, one day, it indicated 84° at noon. The hot season is also the season of rains, and it is then that the mass of the Orchids, and almost every other tribe of plants, come into flower. From these facts cultivators ought to take a lesson in the cultivation of the productions of this and of similar regions. If the difference of temperature between the season of wet and that of flowering be so great in the state of nature, it must be obvious that to grow them well, artificially, a somewhat similar state of things ought to be observed. The greater part of the Orchids which are sent to England from the Organ Mountains grow in the region of the above temperature, the elevation being from 3000 to 3500 feet above the level of the sea. In the account which I shall presently give of my visit to the summit of those mountains, which is more than double that elevation, I shall have occasion to mention several species which may be cultivated in a much cooler temperature.

Another reason why no general rule can be laid down for the cultivation of these plants, is, the great variety of soil and situation which they affect in their native country; some, like Zygopetalum Mackaii, are terrestrial, and grow in open exposed places; others, like Warrea tricolor, are also terrestrial, but grow in the deep virgin forests; some, like Zygopetalum maxillare, are only found to inhabit a particular tree, while others are found indiscriminately on all kinds of trees, on rocks, and even on the ground; some, like Lælia cinnabarina, grow in moist places on exposed rocks; while others, like Cyrtopera Woodfordii, grow in a similar soil, but in shaded places; some, like Maxillaria picta, grow on the most dry and exposed rocks; while others, like Grobya Amherstiæ, grow also on dry rocks, but generally in the shade." *Gardner in Journal of Hort. Soc.*, i. 277.—*Paxton's Flower Garden, October.*

Misseltoe.—We understand that this parasite has been introduced to Ireland by John Oldham, Esq., of Mansfield. This gentleman furnished seeds to Mrs. Houghton, of Bunin House, Carlow, by whom they have been raised, and with whom the plant is now flourishing.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Let immediate attention be paid to the collecting of a good stock of the most useful soils within reach. By getting them into the compost-yard at this season, opportunity is afforded of turning and exposing them to the action of the atmosphere during winter, and thus taking advantage of the frost to destroy the insects with which fresh soil naturally abounds. In collecting turf, it is a good plan to cut it during the next two months, and allow it to lie with the grassy side downwards until it has been penetrated by the first frosts, by which all insects will be driven out or destroyed. Before the turf is cut, the herbage should be mown off it as closely as possible; the clods should not be cut more than from 3 to 5 inches thick, as the part nearest the surface contains the greatest proportion of vegetable fibre, and from having been more freely exposed to the ameliorating influences of the atmosphere, is in better order for early use.

FORCING DEPARTMENT.

Pineries.—Keep a constant eye to the bottom-heat, as at no season is it more liable to vary, and at no season is it more essential to prevent such variations, especially with fruit in progress. To assist in maintaining an equable state of heat and moisture about the roots during winter, it is a good plan to surface the bed with a couple of inches thick of half spent tan or leaves taken from a pit where they have heated and are partially decomposed. This mulching will in a great measure do away with the necessity of watering the roots of Pine plants during the dark months. Let the quantity of water introduced be very much restricted, as the consequent evaporation, if produced in excess, is liable to condense and run into the hearts of the plants. This evil may be prevented, in a great measure, by due attention to ventilation, and by keeping the laps between the glass clean, as the excessive vapour will be then carried off. Where dung linings are used for Pine frames, a covering of mats will be necessary in severe weather; and as these tend to prevent any escape by means of the laps, a little air should remain on all night. Vineries.—Once more we mention the propriety of adopting some efficient mode of protecting Vinery borders from autumnal rains, and the cold produced by consequent evaporation. However well drained the borders may be, and however porous the constituent materials may be, the continual wetting and partial drying of the soil, besides keeping the roots miserably cold and wet, will so injure the mechanical texture of the soil that it will cease to part so freely with its surplus water, and must depend more and more upon evaporation, which will of course draw in similar proportion upon the natural or acquired warmth of the border. Proceed vigorously with the pruning and cleaning of the Vines from which the fruit is cut, and at the same time let any needful painting or other repairs be done, that the houses may have an orderly and finished appearance, and likewise be in perfect readiness for their next year's campaign. By getting this work speedily out of hand, they may be made immediately available for sheltering Chrysanthemums, Geraniums taken up from the flower garden, and other similar plants, which merely require to be protected from the frost.

FLOWER GARDEN AND SHRUBBERIES.

Dahlias, if so far injured by frost as to be no longer ornamental, may be cut down, preparatory to their being taken up in a few days' time. Tigridias and other summer bulbs may be taken up and laid in a cool dry shed, till they will part easily from their haulm. Salvia patens should be taken up and potted, or planted in a frame of moderately dry soil, where it will keep without any trouble, except that of excluding the frost. Flower Beds.—Now that the summer flowering half-hardy plants are removed, make the best amends in your power by drawing upon the reserve garden. All the important beds should be filled with dwarf evergreen shrubs, or spring-flowering plants, as Hepaticas, Primroses, Polyanthus, Alpine Auriculas, Wallflowers, &c. These will supply the beds with foliage, and in spring the flowers of the latter will considerably assist the display produced by the Crocus and other bulbs already planted.

FLORISTS' FLOWERS.

What with wind and frost, Dahlias in situations, unless extremely sheltered, have got their *quietus*. Where the tops are blackened, it will be advisable to lift the roots, leaving a considerable quantity of the top on, and placing them upright in a shed or outhouse for a week or two, when the stems may be cut a few inches from the crowns, and the roots put into their final winter quarters; a good dry cellar is an excellent place for them. If our advice has been taken, all Carnation and Picotee layers should be off and potted. Seedlings for flowering next season should be looked to, the beds cleaned, and surface loosened; spindles should be removed. The best bed for Tulips should now be ready, if properly attended to, and the collection to be planted thereon is worth the trouble; cover it with mats, so that a "dry bed" may be insured for the bulbs when committed to the earth. The previous directions given for Auriculas, Polyanthuses, Pinks, &c., should be strictly attended to.

HARDY FRUIT GARDEN.

Planting and root pruning of fruit trees, where necessary, should now be in progress, to the exclusion of all other work of secondary importance, that as much as possible of this work may be completed before severe weather sets in. Those planted on this side of Christmas have a decided advantage over those moved at a later period; their roots require a very short season of repose, especially if assisted by a little mulching on the surface of the ground, and are in action long before the tops evince the slightest evidence of activity. With regard to soil, the errors most commonly committed are in making it too deep or too good. For Apples, Pears, and all stone fruits, good loam is all that is necessary; it may be mixed with sand or burned clay, if the loam is too tenacious; and if the whole, or at least a portion of it, has been charred, it will thereby be considerably improved. When any additional stimulus is necessary, it can be supplied in the shape of mulching or liquid manure. The depth of soil should never exceed 12 or 18 inches; and if the bottom is not naturally impervious, it should be made so by artificial means. Where the situation is very damp, let the border for the choicer fruit trees—as Apricots, Peaches, and Nectarines—be made entirely above the ordinary level, as it is well worth while to sacrifice a foot of the height of the wall, if by doing so the remaining portion is rendered more useful. We form platforms of rubble 6 to 9 inches in thickness, and concrete the surface of it before depositing the soil. This impervious bottom prevents the roots from getting down into the subsoil, and keeps the trees healthy and fruitful.

KITCHEN GARDEN.

Proceed with the final earthing of Celery with all possible despatch, as the season is too far advanced to admit of longer delay. The same remark applies to Cardoons, the earthing of which should be completed, if possible, by the end of this month. If of the autumn Broccoli or Cauliflowers there is a considerable quantity of heads ready for use, a part of them should be taken up and laid in under the shade of a north wall, where they will be retarded, and may be protected by some covering in severe weather. Carrots are now nearly as large as they will be, and, unless in sandy soils, they had better be taken up now, to prevent their being spoiled by worms.

State of the Weather near London, for the week ending Oct. 17, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 21st, 1826—therm. 72 deg.; and the lowest on the 21st, 1842—therm. 20 deg.

Notices to Correspondents.

Annuals: *W G.* They will be all the better for being thinned out a little. It will tend to keep them from damping off during winter.‡

Apple Stocks: *J B.* Your seedlings are not so fit for stocks as the Crab, and have no resemblance to the Paradise. Whether they will produce good fruit or not, if allowed to grow without grafting, will depend upon the value of the varieties from which the seeds were saved. From the seed of the Ribston Pippin you may get a very good Apple, though it will not be a Ribston Pippin.‡

Araucaria imbricata: *Sub.* It may be transplanted now. Nothing besides the inverted turf should be added in the shape of manure.‡

Asparagus: *K C B.* We strongly advise you to procure Cuthill's pamphlet, and to follow the directions given in it. You may plant now; but not much later, unless you take the spring. You must not think of cutting Asparagus the first year after planting. Plant evergreens now; add a little superphosphate of lime to the water with which they are puddled. Unripe Melons will not ripen artificially.

Books: *A Constant Sub.* The first edition of Donn's Catalogue was prepared by James Donn, curator of the Botanic Garden, Cambridge; the last by Peter Don. We cannot spare time for bibliographical researches.—*J Kelly.* The "Manse Garden" may answer your purpose. We do not give prices or publishers' names.

Botanic Garden, Cambridge: *Sub.* We do not know.

Canterbury Bells: *J S.* Such double flowers are very common.‡

Chemistry: *J N.* Enter yourself a student in some school of experimental chemistry, such as the Birkbeck Laboratory in University College. But your want of education almost unfits you.

Fences: *E F L.* If you cut down your Beech fence, it is not very certain that it will come up again.

Grapes: *T Jones.* Shanking always denotes either that the crop is heavier than the Vines can bear, or that the roots are unable to feed the crop. Your Black Hamburghs are attacked with rust—a skin disease produced by cold winds, fingering, greasing with the hair, over-sulphuring, or any such cause. The white Grape appears to be the Syrian, only suitable for a late Vinery, for which plenty of artificial heat can be afforded. The Cannon Hall has a Muscat flavour, the Syrian has not.—*W T.* A pound of Grapes weighs as much as a pound of wool or a pound of air, viz., 16 ounces.

Heating: *D H W.* You should have two rows of 4-inch pipes for air heat in your Orchid and plant houses, if the latter is to be a stove, or one row in the latter if a greenhouse. What do you want the bottom heat for? It is impossible to advise upon such meagre data as you furnish.

Insects: *A B.* If you will send us specimens of the insects of whose depredations you complain, we will endeavour to assist you.

Mildew: *T B N.* See an article on this subject in our "Home Correspondence" of to-day's paper.‡

Moss on Apple Trees: *Inquirer.* Deep draining is the most effectual remedy; by this means only we have seen a thick coating of moss thrown off from fruit-trees in two years after performing the operation.‖

Names of Fruits: *A Lady, Winchester.* 1, Cadin; 10, 18, Golden Reinette; 11, Dumelow's Seedling; 13, Blenheim Pippin; 15, Orange Pippin; 16, Winter Pearmain; 17, Ribston Pippin. These are worth keeping; 2, 3, 9, 12 are not, especially the three last.‖—*G S.* Bishop's Thumb.‖

Names of Plants: *Micklewell.* We are quite unacquainted with the Begonia; 5, Melampodium, perhaps divaricatum; the Ipomœa is not determinable in its present state; it seems to be related to I. pedata. *Pro phasianis gratias agimus.* You must for the present be content with the names of your Lycopods as you now have them; for on account of the many closely allied species (?) of the section to which these garden forms belong, and it being a question whether they are all described, we find it impossible to decide with anything like certainty from the descriptions of authors; it can only be done by examining their original specimens—a matter of no easy accomplishment; but we promise not to let the subject rest. The one found on "a rock in the Vallée du Tete Noir" is no doubt Lycopodium helveticum of Linnæus. No. 1 may be regarded for the present as the L. denticulatum; 2, as L. Schottianum; 3, as L. apodum.—*Erzeroum.* 466, Centranthus longiflorus; 66, Valeriana tuberosa; 605, Thesium.—*A B C.* 1, Sarcanthus rostratus; 2, Sarcanthus teretifolius; 3, Vanda multiflora.—*J Weeks.* Juniperus Bermundiana.—*D J.* Acer rubrum and Abies alba.—*A B C.* 1, some Cinchonaceous plant; 2, Gnidia simplex; 3, some Diosma; 4, Diosma hirsuta; 5, some Pimelea; 6, some Cupressus or Juniper. We cannot waste time in determining the names of such things as these without flowers or fruit.—*M G P B.* Andropogon Sorghum; it will not thrive in the open air in England.—*J P.* 1, some Casuarina; 2, Spiræa rotundifolia; 3, looks like Anagallis tenella; there are no flowers.—*G W.* Bolbophyllum odoratissimum. Is it sweet-scented?

Netting: *Reader.* There can be no doubt that netting similar to that sent would prove a suitable spring covering for wall trees. Tanning it will serve to make it more durable.‡

Pears: *Inquirer.* The Pears you mention ripen generally in the following order: 1, Jargonelle, Orange Bergamot; 2, Dunmore, Jersey Gratioli; 3, Autumn Bergamot, Marie Louise, Beurré de Capiaumont, Brown Beurré, Gansel's Bergamot, Louise Bonne (of Jersey), Althorp Crassane, Duchesse d'Angoulême; 4, Beurré Diel, Crassane, Hacon's Incomparable; 5, Glout Morceau, d'Auch or Colmer, Knight's Monarch, Passe Colmar, Beurré d'Aremberg, Winter Nelis; 6, Chaumontel, Ne plus Meuris, Winter Bon Chrétien; 7, Easter Beurré, or Bergamotte de la Pentecôte; 8, Beurré Rance.‖

Raspberries: *Lincoln.* They may be transplanted now.‡

Strawberries: *J W B.* If you will have the goodness to refer to the account published at p. 483, you will find that all the information you ask for was given, except the distance of the plants, which is immaterial.

Vines: *A Constant Sub.* Your Grapes are shanking. Something is the matter with the roots, or else the Vines are overcropped. Nothing grows well under Elms, &c.; Privet, Holly, Yew, and tree Box thrive best.

Vine Culture for Cottagers: *C R.* We misunderstood you. What has been already published we cannot republish; but we will insert the new matter if you desire it.

Vine Mildew: *H St.* Your plan may be a good one, but it is a troublesome round-about way of doing what is better done by the direct and simple means of employing flowers of sulphur.

Victoria: *W B.* The plant was permitted by her present Majesty to bear her name. The rest of your inquiry is unintelligible.

Misc: *An Irish Sub.* The answers you have received through the Irish paper are very good answers. We cannot mend them. The agricultural inquiries are gone to the Editor of the *Agricultural Gazette.* Hybrid Roses from cuttings are as good as if budded, if your soil is not too cold.—*D M G.* Pray send to the publisher, who will give you the information.—*J W H.* We regret it; but we really cannot answer inquiries privately. Your plants will take no harm from the paint. The trees you name are tender near Manchester. All are well known in English Gardens, where mere curiosities are cultivated. Jasminum Sambac may be bought in any great nursery. We fear you can get rid of eels by no other means than by emptying your reservoir, and picking them out of the mud. Even then they will get in again.

Erratum. The memoranda concerning the pot for layering Roses, figured at 646, was inadvertenly signed "Falcon," instead of "W." It should have been the latter.

SEEDLING FLOWERS.

Antirrhinums: *H B.* 5 and 7 are the best. The others though pretty are more common.*—*J B K.* All handsome; but none of them are better than kinds already in cultivation.*

Fuchsias: *M.* "Champion of England," as far as we can judge from a single bloom, is a good dark variety. The tube is small, the sepals expand well, and the corolla is of a good colour, but the flower altogether is somewhat coarse.*

Gaillardia: *Y Z.* Undistinguishable from G. picta.*

Pelargoniums, &c. *G G G.* Smashed to pieces in coming through the post. They should have been packed in a tin box.*

Pentstemons: *Anon.* Showy and all worth growing where gay flowers are wanted in quantity; but none of them are superior to kinds possessing the same colours now in cultivation.*

Petunias: *J B K.* The clouded flower with the light throat is the best. The rest are common.*

Verbena: *W C.* Purple with a light eye; a nice variety.*

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Clover Manure, per ton	£11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

DR. S. NEWINGTON'S AGRICULTURAL INVENTIONS.—An Illustrated Catalogue, together with a Lecture on the Seeding of Grain, and the after cultivation of the crops, sent gratis, on application to Messrs. DUFAUR and Co., 21, Red-lion-square, London.

LAND DRAINING AND IMPROVEMENT COMPANY, 30, Parliament-street, London; and Bedford Circus, Exeter.

This Company having been in active operation for several years, is ready to undertake Works under the Government Loan, or by fixed or annual charges under its Act of Parliament

Further particulars and references may be obtained at the offices. THOMAS MAY, Secretary.

SMITHFIELD CATTLE SHOW.

NOTICE.—THE PRINTED FORMS OF CERTIFICATES to be filled up for STOCK and IMPLEMENTS intended to be exhibited at the forthcoming Show in December next can now be obtained of the Honorary Secretary. All such Certificates must be returned, properly filled up, on or before **Saturday, the 16th of November.**

In applying for the Forms for Stock, it is necessary to state the Number of the Class or Classes, as there is a separate Form for each Class.

Prize Sheets and all information can be obtained on application to B. T. BRANDRETH GIBBS, Hon. Sec., corner of Half-Moon-street, Piccadilly, London.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

THE BIRMINGHAM CATTLE SHOW, 1850.—The CERTIFICATES of ENTRY, for CATTLE, SHEEP, PIGS, and POULTRY, are now ready, and, with the PRIZE LISTS, may be had on application to the Honorary Secretary. Intending Exhibitors are particularly requested to mention the nature of the Stock for which they require Certificates. The entries close on SATURDAY, the 16th of November.

The Show will be held in the BINGLEY EXHIBITION HALL, BROAD-STREET. T. B. WRIGHT, Honorary Secretary.

Union-street, Birmingham, Oct. 19.

IMPORTANT NOTICE.—EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

AGRICULTURE.—A Gentleman, who has made Farming his pursuit, and who occupies between 400 and 500 acres of stock land in a southern county, is desirous of RECEIVING into his family a YOUNG GENTLEMAN who wishes to acquire a knowledge of the practical working of a Farm.—Address A. B., Mr. Steel, Spring-gardens, London.

AGRICULTURAL EDUCATION.—The Steward upon a large estate, in the South of England, has a vacancy for a well educated youth to be instructed in farming and general business. For particulars, address X. V., Office of this Paper.

DR. S. NEWINGTON'S IMPLEMENTS OF AGRICULTURE.—These Implements have been invented to introduce an improved system of cultivation, and a more scientific method of depositing the seed. A Prospectus and Lecture on the different methods may be obtained (gratis) by applying to Messrs. DUFAUR and Co., Agricultural Depôt, 21, Red Lion-square, London.

SEED-WHEAT, GIRLING'S KESSINGLAND.—A new variety of Red Wheat with White Chaff, of good quality, long and stiff in the straw, and very productive, may be had of ROBERT RAYNBIRD, Hengrave, near Bury St. Edmund's. Price, delivered to Bury Station, 50*s.* per quarter. Sacks, 1*s.* 6*d.* each. Orders, enclosing a remittance, or satisfactory reference, will have prompt attention.

Hengrave, October 19.

GREEN AND HOTHOUSES made by Machinery, warranted best materials, glazed 16-oz. sheet glass, of a large size, with glass at both ends and one door, painted three coats of best oil-colour, and delivered to any Railway or Wharf in London.

Lean-to.				Unglazed.			Span-roofed, glass all round.						
							Glazed.			Unglazed.

60	— 18	124	13	0	72	14	3	140	8	0	82	8	0	

These Greenhouses are prepared in such a manner that any country carpenter can fix them with ease. A plan is sent free for the brickwork, &c.

Estimates for erecting and heating the above, on application. Lists of prices for Sash-doors, &c., post-free on application.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

EXHIBITION OF 1851.—NOTICE TO EXHIBITORS is hereby given, that Her Majesty's Commissioners have fixed the 31st of October, as the LAST DAY for RECEIVING APPLICATIONS FOR SPACE from the different LOCAL COMMITTEES of the United Kingdom, the Isle of Man, and the Channel Islands. Intending exhibitors failing to give due and sufficient notice to the nearest Local Committee, cannot be assured that their claims for space will receive any consideration. (Signed) M. D. WYATT, Secretary.

PIMLICO SLATE WORKS.—Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 19, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Oct. 24—Agricultural Imp. Society of Ireland.
THURSDAY, — 31—Agricultural Imp. Society of Ireland.

ONE of the most interesting of the recent contributions to AGRICULTURAL LITERATURE that we have seen, is the pamphlet lately published by Mr. MILNE, of Milnegraden, Berwickshire,* on the farm practice of certain localities in England. It commences with an excellent criticism on a passage from Lord KAMES' "*Gentleman Farmer*," which, in its chapter on the "Imperfections of Husbandry," asserts that to be made acquainted with the *errors* of our neighbours is the highway to good farming.

"Notwithstanding my high respect for Lord KAMES," says Mr. MILNE, "I venture to say, that no maxim can be more unsound. If you wish to reconcile a man to an inferior or slovenly system, in any department of industry, all that is necessary is to exhibit to him the example of neighbours worse than himself. If, on the contrary, you wish to stimulate him to improvement, tell him of cases in which persons of the same line or profession are following a better system than him, with advantage and credit; and you will in most cases awaken a feeling, call it rivalry or imitation, which will lead him to correct his errors and enter on a superior course."

And so an ample vindication, if one were needed, is made out, of the usefulness both of example farms, and of reports of good farming, wherever it occurs, for the instruction of those who cannot personally visit the localities.

The instances selected for report by Mr. MILNE occur in Sussex, Dorset, and Gloucestershire. The order in which they are described is, certainly, the order of their merit as examples: Mr. RIGDEN'S farm, near Brighton, being placed first—as that of an intelligent occupying tenant of land, who has long made large profits in his business, and Mr. HUXTABLE'S next as the head quarters whence many an energetic remonstrance and exhortation on farm practice has of late years received the attention of the whole agricultural body. The third case is referred to, rather than described, Mr. MILNE not having had an opportunity of visiting it personally; and it is, accordingly, neither so fully nor so accurately reported as the others. We shall confine our attention for the present to the report of the Sussex farm. And to those who have looked with suspicion on statements of high farming in Wigtonshire, it may be interesting to see how a gentleman, "whose feelings and opinions in reference to the present state of agriculture, are shown by his attendance at Protection meetings, both in his own county and in London," is endeavouring to meet the difficulties which low prices have thrown in his way. The following particulars are condensed from the pamphlet:—

"THE FARM OF HOVE, NEAR BRIGHTON—740 ACRES.—Mr. RIGDEN has a lease—its duration being 14 years. The average produce of his farm, before he entered, was 28 bushels per acre of Wheat, which is 2 bushels more than the average of the county. It has yielded, under his management, usually 36 bushels. The rotation, previously to his occupation, was six-shift, by which two-sixths of the land was in Grass, one-sixth in green crop, and the other three-sixths in corn. The rotation which he follows is a four-shift, by which he has half of his land every year under green crops, and the other half in corn, chiefly Wheat. The farm is situated about a mile to the west of Brighton, and slopes to the sea. But he derives no advantage from sea-weed, as there is little or none thrown up on this part of the coast. The general surface of the farm faces the S.W., and is exposed to the full blast of the gales which blow from that quarter. Mr. RIGDEN has been in the occupation of his farm for nine years. The following Table, made up from the accounts of the year ending Martinmas, 1849, shows the chief items of expenditure and receipt:

YEARLY EXPENDITURE.

Rent		£1300
Taxes		150
Tradesmen's bills		353
Sundries (including insurance, losses, &c.) ...		100
Wages to labourers and servants		1690
Stable-yard dung, purchased ...	£593	
Night soil	50	686
Guano, bone-dust, &c.	43	
Brewery grains, for feeding cows		100
Seed account		150
		£4529

"The yearly receipts include—Wheat sold, Barley sold, stock and wool sold, milk from 21 cows, straw sold; Potatoes on 50 acres, sold on ground; Clover, Tares, and Rye, sold as green meat; hay and Oats sold, pigs sold. The value of the total produce, on an average of the last two or three years, Mr. RIGDEN estimates at 9*l.* per acre. Some of the land is made to bear three crops in two years, thus—Tares, Rape, and Rye are sown in the autumn, which are cut or fed off in April. The ground is thereafter ploughed up, to be planted with Potatoes, Turnips, or Mangolds in May, and in autumn Wheat is sown.

Acres.		Average produce per Acre.	Average price got in 1848–9.
Acres.			
350 in corn.	250 in Wheat.	36 bushels.	44*s.* 6*d.* per qr.
	40 " Barley.	40 "	32*s.* do.
	60 " Oats.	60 to 80 do.	
110 in root crops.	20 " Mang. Wurzel.	30 tons.	
	12 " white Turnips.	20 do.	
	12 " Swedes.		
	6 " Carrots.		
	50 " Potatoes.	150 to 300 bushels.	12*l.* to 15*l.* per acre.
	10 " Cabbages.		
240 in Clover, &c.	50 " Clover.	2 tons.	
	50 Rye-grass and mixed.		
	20 Sainfoin.		
	30 hay.		
	10 Lucerne.		
	50 Tares followed by Rape.		
	30 Peas.		
40 in permanent pasture.			
740			

"Mr. RIGDEN observes, 'My Oats and Barley generally follow Wheat. I am aware this system is open to objection; but as a general rule on the South Downs, we cannot grow good Barley after Turnips. Our custom is to plough the Wheat stubble as soon as possible after harvest, and to plough again when we sow the Barley about the end of March or beginning of April. The land in my occupation is better calculated for Wheat than Barley.' In regard to the soil on the farm, it is, generally speaking, light, and so porous, that, though there are no drains in it, the water seldom stands after the heaviest rains. The stock kept on the

* Report of a visit to the farms of Mr. RIGDEN, Sussex; Rev. Mr. HUXTABLE, Dorset; and Mr. MORTON, Gloucestershire; with remarks on Agricultural Improvement, by DAVID MILNE, Esq., of Milnegraden. Read to a meeting of the East of Berwickshire Farmers' Club. Warder Office, High-street, Berwick-upon-Tweed.

farm is as follows: 350 Southdown ewes, 20 Southdown rams, 150 teggs, or female lambs, a year old, 21 milk cows, 12 heifers of different ages, 28 farm horses, and pigs and poultry a few. The amount of capital expended by Mr. Rigden on his farm is about 12,000*l.*, in explanation of which I may observe, that—1. He had to pay a considerable sum at his entry for what are called 'Mendments,' and 'Half mendments.' [A very complete system of tenant-right in fact.] 2. Almost the whole farm has been subsoiled. 3. Another expensive operation was liming or chalking. 4. Mr. Rigden spared no pains or expense in forming a superior flock of Southdowns. He has 'given as much as 70 guineas for the use of a ram. This (he said) will explain the high price which I obtain for my ewes. The common price last year in this county was from 25*s.* to 30*s.* The prices which I realised were as follows:

150 Wether lambs, sold at an average,	20*s.*	£150	0 0
55 Ewe do.	21*s.*	57	15 0
20 Ram do.	70*s.*	70	0 0
10 Older rams	15*l.*	150	0 0
120 Ewes	3*l.*	360	0 0
385		£787	15 0'

"5. From the nature of the implements employed on the farm, it appears that, under that head also, a very large outlay occurred."

Mr. Milne then proceeds with a very full and detailed statement of the management of the stock upon the farm—the sheep, cows, pigs, farm-horses; and of the mode of culture, specifying implements of husbandry—labour and its wages—seed, quantity and mode of sowing—manure applied, kind and quantity—preparation of the land, and reaping of the crops. And every point requiring detailed remark is amply reported. We have not space for such a complete description as is desirable—those interested in the subject should procure the pamphlet for themselves—but we must find room for the paragraph on the manures employed on this farm. It is obtained from the following sources:

"1. Farm-yard dung, composed of straw and Pea haulm, which has been litter for cows and horses, and for the sheep in the straw yards. 2. Liquid manure, collected in a tank, into which it flows from the byres, stables, and piggeries. This tank is $10 \times 8 \times 1\frac{1}{2}$ feet. The liquid is pumped into a barrel on a cart. 3. Stable-yard dung, purchased in Brighton, and of which, last year, Mr. R. got 982 long waggon loads. 4. Night-soil, procured from Brighton, and of which last year there were 935 loads. 5. A small quantity of guano and bone-dust and lime, purchased.

"The liquid manure from the tank is used in two ways. After the Clover or Lucerne is cut, a quantity is spread over the land by means of a barrel. When not used in this way, it is applied by being poured over the dung-heap. The land receives a good deal of manure also from the sheep folded on it. The night-soil would of itself be too strong to be applied. It is, therefore, made into a compost with earth, burnt clay, weeds, &c. Mr. Rigden occasionally gets ammoniacal water from a neighbouring gas-work, which he spreads on his pastures; but he does not like it. It makes the Grass grow very rapidly; but he thinks that it causes the coarse Grasses to prevail. He purchases soot also, which he applies to his young Wheat at the rate of 40 bushels per acre. There are about 3 tons in each of his long waggons, so that he brings to his farm 2946 tons of stable dung, and 2805 tons of night-soil," at a cost, according to the previous statement, of nearly 1*l.* per acre, over his land.

Now, though it appears from the above statement that nearly 2000*l.* a year, on the average of the last two or three years, have been cleared off the land, or 16*l.* per cent. on the capital employed, we are not going to argue in favour of the system adopted, on account of any result in figures or words, which it appears to furnish. It is not so much because Mr. Rigden has adopted any particular rotation, or practised any particular scheme of farm management, that his example will be useful—but because he has furnished an instance of the way in which energy and resolution, when seconded by the ability which ample capital confers, are able to develop the resources of the land so as to balance the evil of adverse circumstances. Of course the word "ample," as regards capital, merely describes the *relation* which obtains between its amount and the farm's extent: and there are few occupying tenants but might, if they wished, furnish themselves with capital as "ample" as that which Mr. Rigden invests, by reducing the amount of their holdings. We may depend upon it that upon the relation between the means of the farmer and the extent of land he aims at farming, depends the question of profit or loss in agriculture: and "high farming," as Lord Stanley has told us at Bury, and Mr. Rigden shows us at Brighton, is the only way to meet low prices.

PHILOSOPHY OF THE DUNGHILL.—No. III.

(*Continued from page 650.*)

Application of Manure.—If we consider the nature of the roots of plants, we shall be better able to understand how we should apply our manure to the land, so that the plants may receive the greatest advantage from it. The mouths of plants which take their nourishment from the soil are at the extremity of fine silken rootlets (called spongioles by botanists); these suck in the moisture containing the nourishment they receive from the active soil, these small spongioles spread over the whole cultivated space between the rows of plants, however wide or distant they may be, in search of the food which the plants require. But roots extend in depth, as well as horizontally; and the depth to which they are restricted is just the depth to which the soil is cultivated, and to which the influence of the sun and air extend, and has made the soil active. This being the case, we have another instrument in our power to increase the field for the roots to feed on, by perfectly draining, subsoil ploughing, and deep cultivation of the soil. Before the land is properly prepared for receiving the seed, we must always keep in view that the depth to which the roots of plants are enabled to go in search of food is just the depth of the active soil.

When dead animal or vegetable matter, and the excrements of animals are left on the surface of the earth, owing to the affinity which the oxygen of the air has for all dead substances, their destruction is the result, decomposing them into their original elements; each of these again takes that place in nature from whence it was originally abstracted. And this fact should instruct us that no animal or vegetable matter or animal excrements should be left on the surface of the earth for a single day without being covered with earth; the affinity which the substances resulting from the decomposition of the dead matter has for the earth will thus prevent them from rising above the surface.

The object of the farmer, in applying manure to his land, is either to repair the injury which has been done to it by the preceding crops, or to increase the productiveness of the soil.—The mode which Nature adopts to produce her crops and increase the productiveness of the soil, is by letting the crop die and decompose on the ground which produced it, and this goes on year after year, each crop furnishing food for the crop that is to follow; in this way the soil has organic matter in it in every stage of decay from the first to the last stage of decomposition.

We shall find the produce to be in proportion to the quantity of soluble matter in the soil fitted for the nourishment of the plants cultivated, and for this reason there should always be a store of nutriment in the soil for its crops to draw upon, being convinced that whenever this account is overdrawn the land becomes in a state of bankruptcy, and so does its occupier.

We ought, therefore, always to apply more manure to our crops than they require, to give more of the materials of the crop to the soil than the crop draws from it; in this way we increase the productiveness of the soil—there is always a large active capital in the soil ready to be drawn upon under every circumstance.

To be able to apply the manure properly we should not only know the kind and quantity of the materials required by the different plants we grow, but also the requirement of the soil, viz., the slowness or rapidity with which the land permits the decay of manure, to enable us at all times not only to keep up but to increase its productiveness; we should therefore keep in mind that manure is decomposed much sooner in a loose silicious sandy soil than in a clayey loam, that the same quantity applied to a sandy soil will produce its effects in a much shorter period than in a clay soil or clayey loam, and that the more rapidly the manure is decomposed the greater is the result produced.

The cereal plants, when producing seed, are much injured by the application of rank or fresh organic manure; their stems and leaves grow close together, are too luxuriant, and become feeble and unable to retain an upright position, too much nourishment and want of air make them plethoric, but the weight of our root crops we believe to be in proportion to the amount of organic matter in a decomposing state in the soil for the plant to assimilate the nutriment which they require; and we have found the crops of Wheat which follow the roots are in proportion to the state of culture in which the land is left after the root crops are withdrawn from it.

The time which the manure takes to be completely decomposed into soluble and gaseous products is a subject of the greatest importance to the farmer. This does not depend entirely on the nature of the materials of which the manure is composed, but also on the nature of the soil to which it is applied, and to the heat and moisture of our climate. The manure which, during a single season in the soil, is completely decomposed into soluble or gaseous products, will, of course, exert the whole of its nutritious influence on the first crop, leaving no valuable residue in the soil for the following year; but this is never the case with farm-yard manure.

From the reasons previously given, we apply manure every second year when the land comes in course for a crop of roots; and if it takes six or eight or ten years to complete the decomposition of the manure, then we have three, four, or five portions of manure, in as many stages of decomposition, furnishing the necessary supply of nutritive food for the plants we cultivate; the manure in every stage of its decomposition, and the humus or carbonaceous residue of it may act not only as a sponge to imbibe and transmit ammonia, &c., but it may also have a mechanical effect on the soil, so that the next application of manure to the improved soil will have an increased effect.

I think it may be safely estimated, that of the manure applied to land 40 to 50 per cent. is consumed the first year, 25 to 30 the second, 15 to 20 the third, and from 10 to 15 the fourth year, and that the influence of it may be felt for five or six years.

We never apply manure to any crop that produces seed; we invariably apply it to fodder crops—those crops which produce food for stock, and which we call dung-producing crops; which, by their consumption, increase the elements of an additional supply of rich manure for the reproduction of the same kind of crop.

But we must remember that manure will remain in the soil in an inactive state unless it is minutely divided and evenly spread over the land and immediately ploughed into the soil, and repeatedly cultivated so as to separate its parts and mix it intimately in the soil; for it is from the action of the air, moisture, and heat on it which makes it decompose, and fits it for the nutrition of plants.

Whatever inorganic matter the plants receive, Nature supplies it in very minute doses; nitre, soda, ammonia, and so on, are given in small doses, diluted with rain-water. Of these, ammonia is so minutely divided that chemists cannot measure its quantity; in the rain-water they merely find a trace of it. Now, as this is the way Nature adopts, we should also adopt the same system.

Half decomposed manure should be ploughed deeply into strong or clayey soil before Christmas, or early in the spring, that it may be well mixed with the actual soil; the roots have thus a greater field in which to find the matters which they are to assimilate, and which we have supplied in the manure, and it being well mixed is easily found, and rapid growth is the result; the roots thus occupy every portion of the active soil, however deep it may be, if within the influence of the sun and air; they are then able to resist the greatest drought as well as the severest and often repeated frost in the spring; there is, therefore, no check to the growth of the plant when the seed is forming (which is the case when the active soil is only 3 or 4 inches deep), as the roots receive their nourishment from a depth beyond the influence of the great changes in the weather.

Manure applied to land in good condition, which gives out its nutritive or fertilising matter slowly, is the best; but on poor land there ought to be the application of that manure which rapidly decomposes, and thus rapidly gives up its fertilising matter from the first, and it must supply food to the plant from its sprouting, and continue it unremittingly till the plant has produced its seed ripe for harvesting.

Poor sandy soils contain little carbon, hence the application of a large quantity of vegetable and animal manure is required, this being more lasting than artificial manure.

The principal object of the farmer, in the application of manure to his crops, is to put them into vigorous growth, to carry them through the first stages of their infancy, to strengthen their roots to go in search of food, which they will find in deeply cultivated soil. *J. M.*

THE MASTER AND THE SERVANT.

A Village Lecture.

During last winter there were, as you know, a number of evening lectures delivered in this room on a variety of interesting subjects, which aimed at providing amusement as much as at communicating information. I believe they succeeded in yielding both—but the amusement they afforded was their object at least as much as the instruction they communicated. Now I wish at the very outset of this lecture to forewarn any who may have come here for an hour's mere recreation that they are sure to be disappointed, for that my present subject does not enable me to aim at furnishing amusement at all. It admits of no illustrations able to excite a smile or a laugh—of very few that will even induce your surprise—but though it should fail to amuse you, it is not the less interesting on that account. I assure you that it well deserves the earnest consideration of every one of us, and I venture to say that it will receive the earnest consideration of every one here—whether man or boy—who has a manly spirit in him. For nothing can more properly claim the thoughtful regards of a man, than this, which affects the welfare of so large a number of his fellows.

Of course it needs to be impartially and intelligently, in order to be usefully, set before you. It needs one who is neither master nor servant (only no such being exists), or one who is both—to award to both with fairness their respective shares, when considering the relationship between them. And it needs one who possesses a knowledge of men and things perhaps greater than any one man does possess, to give the subject that complete consideration which it deserves. I am well aware that the present will be a very imperfect attempt, both because prejudice may hinder me from judging correctly, and because ignorance will keep many an important consideration out of sight. But I think that you too will admit that each of you, whether master or servant, are also liable to be prejudiced in favour of the particular ideas you have hitherto held on the subject. So let us all admit that we are apt to be wrong; and we shall be the more likely to let the rubbing against one another of our respective ideas ultimately set us right.

Now I must, in the first place, specify the exact nature of the topic on which I have to address you. The relationship between master and servant includes the whole moral aspect of the bargain by which a man's labour is exchanged for money; and so it suggests a discussion of the duties on either side which such a

bargain creates. And I might speak of penurious masters and of idle servants; of the eye service which is industrious only in the presence of its employer, and of the cruelty which has been known before now to grind the condition of a servant down to that of a slave. And a sermon might be preached on the relative duties of the two parties from those verses as a text, "Servants be obedient to them that are your masters—not with eye-service, as men-pleasers, but with *good-will* doing service, as to God and not to man. And ye masters do the same things unto them, forbearing threatening." But this is a branch of the subject I shall not enter upon at all. It is not of the due performance of the bargain when once made—a thing on which every one knows his duty, and every honest man will *do* it—but of the nature of the bargain before it is made that I have to speak.

Again, the subject includes the whole history of this bargain; and I might refer to patriarchal times when servants were for the most part bound to the head of the household, by custom if not by affection, receiving support as one of the family, for his labour, rather than wages, as having been hired; or to after times, when the superior nation for the time alone was really free, and made slaves of all the others; or to a later period still, when the distinction, even in this country and in this place, between master and servant, was almost as great as that between master and slave. But the discussion of all this, even if I were able for it, must be considered curious rather than useful, and it forms no part of my plan.

The subject also includes a consideration of the actually existing nature of the relationship between master and servant in different countries of the world; and I might speak of civilised nations, among whom the horrors of undisguised slavery are still permitted, and of others where so much of that system still prevails as binds the servant to the land, which he cannot leave but with the permission of its owner, to whom he pays service on Mondays, Tuesdays, and Wednesdays, for the plot of ground which he is allowed to cultivate for himself on Thursdays, Fridays, and Saturdays. This is the state of things in Russia and other parts of eastern Europe now; it degrades the servant to the position of goods and chattels, which pass from owner to owner with every sale of the property.

Our subject also includes the relationship between master and servant among all the different trades and professions in our own country; and I might speak of trades unions and of strikes—of legislative interference between the employers and the employed—of the Ten Hours Bill, and so on. But none of this forms part of my plan. I shall confine myself to the present time and to our own country, and from among all the trades and professions which find occupation within it—to that of the agricultural labourer alone. I propose to describe his condition in different parts of the country; I propose to point out the modes by which alone, as I believe, it can be improved; and I propose to show how his condition, and that of agriculture itself in any district are connected.

Do you think that by thus limiting the subject I have reduced its importance so as to render it unworthy of an hour's consideration? Just consider: there are in England and Scotland 31,000,000 of acres of cultivable land, employing in their cultivation about 2,000,000 of men, on whom, including themselves, a population of six or seven millions are dependent for support. Is the welfare of this large section of the population so trifling a matter? And how much of that welfare hinges upon the nature of the relationship between master and servant you can easily imagine. Take any one of this immense number, and consider that his whole maintenance depends on this matter; that from six to eight out of every 12 of his conscious hours are spent directly, and all the others indirectly, under the influence of this matter; and you must admit its importance. Let any young man here think that in the 30 years he may yet live, there are 260,000 hours, that, taking on an average 8 of every 24 of these hours, and deducting Sundays, he may have 75,000 hours of labour before him; surely he will agree with me that it is his interest to consider a subject which, were it earnestly studied, might throw some light on his prospects for that long future, and point out methods by which his condition during all that time may be bettered. Let us then give the subject the attention which it deserves. I shall first endeavour to describe the condition of the agricultural labourer in different parts of the country. This I shall do as shortly as possible.

Almost all over Scotland and the northernmost counties of England, the labourers are paid in great measure in kind, receiving their wages in Oatmeal and milk and Potatoes as well as money. Thus the unmarried servant in Fifeshire receives 8 cwt. of Oatmeal — about 2½ lbs. a day, half a gallon of milk daily, and about 10 or 12 cwt. of Potatoes a year, with from 12*l.* to 18*l.* a year, and lodging free, either in a room set apart for himself and others in the farm-buildings, or with one or other of the families employed on the farms. The married servants in Northumberland and elsewhere in the north are provided with cottages and small gardens on the farm rent free, and their wages are so far paid in kind as to avoid the necessity of going to market for such articles as Oatmeal, Potatoes, cheese, bacon, milk, and so on. And notwithstanding what economists say about money being the only proper medium of exchange for labour, as for other things, the custom of paying labourers in *kind* works well both for masters and servants. In times when grain sells high, the payment of the farm servant will cost his master more than the ordinary rate of wages at the time; but, on the other hand, in times of great depression the terms, being the same, are in his favour, because he would have to sell nearly double the produce to enable him to pay his labourers in cash. Now let me tell you what a married Northumberland farm servant receives per annum. He has 36 bushels of Oats, 24 of Barley, 12 of Peas, 3 of Wheat, 3 of Rye, 36 to 40 of Potatoes, 24 lbs. of wool, for his wife and daughters spin this wool and knit for him his stockings and so on; he has also a cow's keep for the year, a cottage and garden free, and the hauling of all his coals; and, lastly, he has 4*l.* in money. Altogether, according to present prices, these amount to about 36*l.* in the year. Besides this, he is bound to supply a woman servant whenever the farmer requires one, as at harvest time and Turnip-hoeing, receiving as her wages 1*s.* a day at harvest, and 10*d.* a day at other times. The other females of his family receive 1*s.* a day *generally*, and 2*s.* 6*d.* a day at harvest time, for in that county the women are as skilful with the sickle as the men. The food of the labourer of Scotland, as you probably all know, consists chiefly of Oatmeal-porridge with milk for breakfast, and their bread is made (at least in Northumberland) chiefly of Barley and Peas-meal mixed. Now, were this mode of paying labourers adopted in any of the southern counties, though people probably would not get a more wholesome food than this, yet of course the kinds and proportions of grain would have to be regulated by the tastes and habits of the people. The grain given to the servant is always to be of the best that the farm produces, and one-fourth part of the quantities stipulated for are paid in advance at the beginning of each quarter. It is sent by the farmer to the neighbouring mill and ground at the wholesale charges into the different sorts of meal, and thus the intermediate profits of retail dealers, meal sellers, and bakers, are saved to the consumer, and the corn which would cost the farmer 16*l.* to pay his servant is more valuable to the latter than 20*l.* paid in money wages would be, to be spent in stones of flour or quartern loaves at the end of every week.*

Now I would suggest to masters and to labourers here whether the more general adoption of payments in kind to those who are engaged from year to year would not be for their mutual benefit. It is plain that one obvious benefit arises out of it besides that of having a store of wholesome food always at command, and that is, the absence of all temptation which the receipt of weekly wages and the need of resorting to the village shop or the neighbouring town to buy provisions hold out of spending some part of the money in the ale-house, which ought to provide for the wants of the family. And that it suits the people well I can prove by a list of men working on a farm in Northumberland, at the date of my information, with the periods during which they have been at the same place: George Cranston has lived with his present master 25 years; Alexander Tunnah, 12; John Redpath, 1; Samuel Ewart, 30; Andrew Gray, 9; Andrew Elliott, 14; T. Robson, 4; J. Cranston, 20; Andrew Young, 12; Ed. Davison, 15; G. Chirnside, 10; J. Middlemas, 3; Thos. Fullerton, 18. That looks as if there were mutual satisfaction; and if you should have thought that the receiving so small a portion of money as only 4*l.* a year must work ill, I have to tell you that these men left 105*l.* 15*s.* 8*d.* of their wages in the hands of their master at the last quarterly pay-day, having no immediate use for the money. Besides you know many of these families will not have need for all the stores they receive, and the farmers will always give them market value for what they do not need. Now I do think that this presents to us a very satisfactory state of things as between master and servant. "Look into one of our north country cottages of a winter's evening," says Mr. Grey, of Dilstone, "and you will probably see assembled the family group round the cheerful coal fire; the female sewing or knitting; the father, perhaps, making or mending shoes, an art which almost all acquire, and one of the younger ones reading for the amusement of the whole circle; and contrast this with the condition of young men employed as farm servants in one of the southern counties, who, being paid board wages, club together to have their comfortless meal cooked in a neighbouring cottage, with no house to call their home, left to sleep in an outhouse or a hay-loft, subject to the contamination of idle companions, with no parent's eye to watch their actions, and no parent's voice to warn them of their errors and say which situation is best calculated to promote domestic comfort, family affection, and moral rectitude."

As we come towards the south things do not generally improve in this respect. Labourers receive weekly wages; the shepherd, perhaps, and the carter or headman on a farm may receive a cottage rent free; but the others hire for themselves. The following were the wages received by able-bodied workmen in different counties last May. I obtained them from different employers in each county:

Yorkshire, 10*s.* to 12*s.* weekly; Cottage rent, 50*s.* to 60*s.* a year.
Derbyshire and Notts, 10*s.*; Cottage rent, 3*l.* to 5*l.*
Cheshire, about 8*s.*; Cottage rent, 4*l.*
North Lancashire, 10*s.* to 12*s.*; Cottage rent, 4*l.* and even 6*l.*
South Lancashire, 9*s.* to 10*s.* weekly.
In Norfolk and Suffolk, 7*s.* to 8*s.* a week; Cottages from 50*s.* to 70*s.* a year.
In Worcestershire, 7*s.* to 9*s.*; and here the custom prevails of giving beer or cider to farm servants, half a gallon a day in most places.

In Herefordshire the wages are 7*s.* or 8*s.* a week, In our own county, 7*s.*, 8*s.*, 9*s.*, and 10*s.* a week in different places, with, in some places, two or three quarts of beer daily. Go further south still, and we have on the eastern side of the island, in Essex, from 8*s.* to 10*s.* a week; Surrey and Kent, 9*s.* to 10*s.*; Sussex, 8*s.* to 10*s.*, and on our own side of the island, in Somerset, Wilts, and Dorset, the three counties where labour is worst paid in the kingdom, we have the weekly wage from 6*s.* to 8*s.* a week, with cottage-rent to pay out of it, amounting to from 1*s.* to 1*s.* 6*d.* a week.

Now we shall consider the cause of all these differences presently. Meanwhile if any one is indignant at the idea of an able-bodied man with his family having to live on 6*s.* a week, I ask him to cross the Channel with me into Ireland, where he will find men rejoicing to find employment at 7*d.* a day! My friends, there may be distress among us in individual cases here and there; but we are well off compared with the greater part of the island, and we are well off indeed compared with Ireland. I have *seen* families living there under cover such as I would not think enough for my Potatoes or Mangold Wurzel. Two pairs of crossed sticks set up in the Potato field, with a ridge pole to connect them at top, and covered by the haulm from which the day's dinner has just been dug, is the roof under which many an Irish family is living now. Aye, a drear and cheerless life is that of many an agricultural labourer. Poets have praised its peacefulness; but death and the grave too have been praised for this. The realities of life on 6*s.* a week or less have not been experienced by those who pretend this praise. The dreariest blank for retrospect, no anticipation of a better temporal future, and a constant present of half satisfied bodily wants, make up the life of many a labouring man; and though so low as this, he fears a lower still, for the period of his employment is as fickle as the wind; his health may leave him, and then the workhouse awaits him. This is a true picture in many a district of his condition; but what a contrast it presents to that of the Northumberland labourer already alluded to.

Now what are the causes of these differences? How shall we bring all to the condition of the best among them? Let us consider this question for a while. Shall we urge our farmers to pay higher wages? Shall the landlords tell them, unless you pay your men more money per week you shall be no tenants of mine? This seems a direct and immediate remedy for the evil. Ah! but I can say, with perfect confidence in my accuracy, that such a scheme must fail. This is not the way to meet the mischief. The value of labour is beyond our direct control. *We* cannot fix it; it fixes itself. And just as the price of English Wheat or of American cotton rises or falls according to the proportion between the quantity wanted and the quantity offered in the market, between the demands of the purchaser and the supplies of the seller, so the value of labour rises or falls according to the proportion between the men wanting employment and the employers wanting men. Set a railroad working close by, which should take off half our men, and wages would rise for the remainder; as surely as, supposing you to lay down all your ploughland to Grass, wages would fall. Anything which increases employment increases the value of labour, and anything which diminishes the one diminishes the other also. The thing is unavoidable—it is a necessary and inevitable consequence; and there is no use in crying out against it, or attempting to improve our circumstances irrespectively of it. *Force* a farmer to pay more wages than the natural rate according to the supply of labour in the market, and you diminish his ability to employ labour at all. There is a certain proportion of the produce of the land which, when turned into money, must be reinvested in the labour necessary for the production of the next crop. If that proportion has to be divided among a greater number of men there will be the less for each; if among a smaller number, each will have the more. Take the case of Ireland, where 10*d.* a day are first-rate wages. Suppose I go over there and take a farm. There is a certain population upon it, who must find support upon the land. If I abruptly raise the rate of wages among that large number of people to the rate of more favoured districts I shall have absorbed all the produce of the land to pay for the current crop, and I shall have nothing left either for my own maintenance or theirs for another year. Hard-hearted farmers of Somerset, Wilts, and Dorset-shires! Why they are as good-natured and willing to benefit their neighbours as those of Northumberland. It is not *their* fault that wages are low. If with their agricultural population wages were to be forcibly raised to those of the northern country they would be ruined; and what is more to our present purpose, the *business of farming* would be ruined, by which alone any wages at all are provided.

Farming must be profitable to be kept agoing; the more profitable it is the more energetically will people engage in it—the greater will be the demand for labour, and the higher will its value rise in the market. This is the way in which the rate of wages may be influenced, if you please; but never let us think that they can be raised by main force, or by the mere carrying out of a resolution. They are a growth—we may sow the seeds of the plant, and what these are we shall consider presently—but we cannot call it full grown into existence at once. If we do, it will die all the sooner for our pains, and we shall find that it has exhausted the soil from which it drew its nourishment.

There is no such thing then as a duty to pay higher wages, because at the existing rates people are very

* See Mr. Grey of Dilston's paper in Vol. 2 of the English Agricultural Society's Journal, whose description and whose words I have generally taken.

badly off. I have a good deal yet to say upon this. The wages paid for labour, excepting where kept back by fraud, involve no question of duty at all. They are the simple commercial result arising out of the demand for and the supply of the article of which they are thus the value.

You may have heard of Louis Blanc, a Frenchman, whose doctrine on the subject of labour produced the last attempt at revolution in France—the bloody fight at Paris in June 1848. He regards it—and it is the very essence of what is called Socialism in this country—as a *duty* to pay high wages; and it is not too much to say that it was this doctrine which produced all the bloodshed to which I have referred. He is for reducing men to the condition of children, and for elevating a representative government as the common father; and of the latter he would require food and employment and protection for the family, according, not to the ability but the necessity of its members. Those who need it most shall have the most. He that hath *not*, to him shall be given. That is Louis Blanc's opinion. He forgets that the interest of self preservation implanted within each of us is generally so sufficient for its purpose, and that the law of neighbourly kindness is so able to supplement its deficiencies. He has forgotten that by putting these aside he necessarily checks the growth of that robust manhood, on the one hand, and of that social benevolence, on the other, which they naturally tend to cherish. Let us beware how, in any means for benefiting our neighbours, our efforts tend to weaken those natural safeguards of society infinitely more powerful than anything that can be artificially substituted for them, which exist in the conscience and moral constitution of man, and to the encouragement and influence of which our efforts ought to be almost exclusively directed.

Yes, I have heard of a scheme for benefiting the labouring classes. It was put forth by one who I have no doubt is a really benevolent man. He proposed that a subscription should be set a-going for pensioning off 8 or 10 or 20 of the aged and decayed members of the body in our different country districts, and placing them beyond the fear of the bleak old age of a pauper life. What could sound more sweetly to a kindly disposition! My friends, I conscientiously believe that in few other ways could a thousand pounds be spent more mischievously or more injuriously for the interests of the labourers themselves than this. The gentleman to whom I allude would find that not merely in the proportion but far beyond the proportion in which he provided these retreats for decayed labourers would there be decayed labourers seeking admission; and thus there would be more poverty and distress among us than ever. They would act simply as premiums upon that thoughtlessness and improvidence to which so much of poverty is owing. This may sound harshly to you; but I believe it to be the truth. The necessities of life—the thorns and the briars of the "cursed" ground, as some people think them—are the greatest motive to effort; and they are thus in reality the greatest motive to that on which, by the very constitution of our being, personal happiness depends; and if any one be relieved of them otherwise than by his own prolonged and successful endeavour, not only is his own comfort none the greater, but that of others also who, expecting similar fortune, will neglect to provide for themselves.

Remember, it is not to assistance rendered in cases of extraordinary visitation that I am objecting. I would have free hospitals for the diseased in body and free asylums for the diseased in mind multiplied in the land; but it is the pension list of all whose helplessness come in the ordinary course of nature that is injurious. Men, able to foresee the period of want, should have provided against it. You say they could not. Well then, I reply, all our benevolence ought to be exerted in removing the obstacles from their way—not in supplying their need, but in enabling them to provide for themselves. Whether the omission of people to provide for themselves has arisen from real inability, or from idleness and dissipation, our efforts ought to be directed rather to uprooting the mischievous cause than to the removal of its effects as they arise. Dr. Chalmers has well pointed out how it was the Highest Wisdom whose all-powerful benevolence—when Christ was on earth—was so often put forth to remove bodily affliction, and so seldom to satisfy the ordinary bodily wants, which could have been foreseen and provided for.

It is really true, however hard it may sound, that to cherish the dependent is to destroy independence. Pauperism will not be cured, it will be encouraged, by systematically supplying its wants. Treat it in this way and you shall find it one of those things which cannot be satisfied, but are continually crying, "Give! Give!" And if any one wants to remove poverty from any district, I believe that he will best attain his end by exerting himself for those who are still among the self maintaining. We should make it as true of material things as it is of spiritual things, "To him that *hath* shall be given, and from him that hath not shall be taken away even that which he hath." Masters should treat their servants not according to their need but according to their merits. Pay your men according to their need, and you shall soon have them needy enough. But pay honour to skill and ability and trustworthiness, and labourers will strive after them. Let the best labourer always have the best wages, whether he be married or not, whether he have a family or not, whether he have other means of support or not. And just so as regards allotments. Let the largest piece be offered not to the poorest man, but to him who is best able to cultivate it, who being the nearest to the field, or having the smallest garden already, will have most time to spare upon it—who having growing children will have most labour to apply to it. If poverty and not ability is to be our guide in allotting these small farms, they will have a pauperising rather than a strengthening tendency.

It is greatly to be desired that our young men should come to understand that it is upon their own exertions they must depend for rising, or even for maintaining their position; and this they will best find out by seeing that it is not the helpless who share our strongest sympathies, but those who are getting on in the world. The labouring man must depend upon himself for success, simply because he will find all other support to be as a broken reed. Do you think that if the rich would share their wealth with the poor it would be a good thing? Do you think that if the whole property of the country were divided equally among its population they would be benefited? I do not believe one in ten of the very poorest would for a single year be the better off for it. "The wealth of this kingdom depends not upon its property but upon its incomes;" and where would *they* be then? Did you ever think how small a quantity of real property is needed to furnish incomes to the many through whose hands it successively passed? Why, if all the gold in the country were equally divided there would not be a sovereign apiece for us. Were the wealth of England dependent on its capital, upon its actually realised property alone, it would be a pauper country.* Talk of the great value of the soil! Let me tell you that a larger sum of money is spent every year by the people in the gin-shops than the whole annual rental of the land amounts to: 50,000,000*l.* a year are spent on spirituous liquors. The knowledge of this extraordinary fact may suggest to you a method of improving the condition of the labouring classes, if you please; but never think that the rich will help the poor by each in his own neighbourhood sharing his wealth equally with his neighbours. To do this would be to injure them; it would be to stop all employment; and labour ceasing, except that of each man for himself, who would carry on the great manufactures of iron, clothing, and other things which have now become necessary to our very existence? You may depend upon it that upon the present unequal distribution of wealth depends the comfort and the welfare of the labouring classes. It is not by the direct assistance of the rich that they can permanently benefit; it is each for himself must work the matter out. And let us not think that to advocate this is to encourage selfishness, and to isolate men, and to destroy the sympathy which binds each to his fellow. For another truth has yet to be told. *M. S.*

(To be continued.)

Home Correspondence.

Allotments.—I quite agree with your correspondent in the last number of the *Gazette*, that the comfort and respectability of the agricultural labourer is in every way to be encouraged, but I altogether differ from him in thinking a rood of ground, a cow, and pigs, tends to that effect; the ground, &c., *cannot* be properly cultivated and looked after without depriving his employer of the fair day's work to which he is entitled for a fair day's wage; and most practical farmers know of certain objections to their labourers keeping pigs, to which I need not more fully allude: it is quite an Irish system, which I regret to say is introduced into England by philanthropists who themselves do not employ any number of labourers, or who merely farm for amusement. I have now some labourers who have allotments, but never again will I take a man who has land of his own to cultivate in addition to that of his employer. *A Practical Farmer.* [We cannot avoid saying, that though occupying about 300 acres of land, and employing about 700*l.* or 800*l.* worth of labour per annum, we have no hesitation in saying, that the allotment system is not in the least injurious to us. All our men have allotments varying from 40 to 80 perches of land].

Steam Ploughing.—Observing that some interest is excited amongst your correspondents by the idea of steam ploughing, allow me to suggest that it seems doubtful whether steam (applied directly) can ever be made sufficiently portable for the purpose. As "An Old Farmer" in a late Number observes, "power without ponderosity" is requisite. I happen to have some acquaintance with a patented invention which seems to realise this desideratum to some extent; I allude to the application of compressed air as a motive power. I have seen a heavy carriage, with several persons on it, driven along a road by this power at a smart trot. The inventor, like many others, had not capital to give it a fair trial. The advantages of this means of applying steam or other power to agriculture would be these. Supposing a farmer had a stationary steam-engine, or a water wheel for threshing and other operations, at any odd times when not required for other purposes, spare power might be employed to compress air into a main receiver, where it would always be ready to draw off into the locomotive ploughing machine. The air locomotive would not have to convey the weight of water, fuel, fire-bars, &c., necessary for a steam-engine, but only a moderate sized air receiver. Supposing a farmer had no water-power, and that steam was considered too expensive, he might then have a windmill which should compress air into a large stationary receiver whenever the weather suited, night or day. When he required either to thresh, cut chaff, or plough (supposing a ploughing machine invented), he would only have to draw off the requisite quantity of compressed air to work whatever machinery he desired to drive. The great advantage of this power seems to be that it is never wasted; when the work is done it has not to be blown off and lost, together with the fire; as soon as your work is done, however short a time you may have used it, you have only to turn a cock, and the remainder of the air in your receiver is ready for another time. A cheap but inconstant power like the wind, or the rise and fall of the tide, may thus be stored up for use. The cylinders full of compressed air, after they had raised and lowered the piston of the engine, would be available for winnowing the corn, or any other purpose for which a current of air was requisite. In the experiments I allude to, when the compressed air was allowed to escape from the receiver, the absorption of heat, as the air expanded, was so rapid that water thrown amongst it fell in lumps of ice! Should any of your readers feel an interest in the subject, I could, I believe, put them in communication with the patentee of an invention which I have long thought might be made available for agricultural purposes either as a fixed or as a locomotive power. *T. T.*

Raising Water for Irrigation.—It would be of great value to me to be able to raise water from a river only 2 feet, for the purpose of irrigation or water-meadows. You will conclude from this that the stream is very sluggish and the fall trifling; you must also know that I cannot put in a dam or weir. However, the stream is considerable in quantity, subject to rise and fall considerably in floods or in drought; but the thing wanted is to have the command of water when too low to overflow naturally. I have some idea that a wheel might be fixed on a floating stage anchored, or otherwise secured, so as to rise or fall with the water; and that either by buckets attached to the same shaft or by pumps a sufficient quantity might be raised by the stream acting on the floats of the wheel, as in an undershot mill-wheel. Has any reader of the *Agricultural Gazette* personal experience of any such plan, or could he put me in the way of consulting a competent person on the subject? *T. T.*

Markets.—It is to be regretted that we have no means of readily ascertaining the increase of the quantities of stock or grain sold in each month. I find from the Smithfield returns for June and August, the only perfect months for which I have returns, the following:

June (four weeks)...	1850,	Beasts	15,607
" "	1848	"	15,149
" "	1850,	Sheep	122,504
" "	1848	"	103,280
August (four weeks)	1850,	Beasts	14,164
" "	1848	"	13,760
" "	1850,	Sheep	126,380
" "	1848	"	102,580

I doubt if this increase could be shown throughout the year; and even if it could, it does not prove any great increase in the consumption of meat from low prices, taking into consideration the increase of the population of London, and the greater facilities than formerly of carrying animals to London. To be sure, one butcher boasted, "that his brother had never made so much profit since he wore a blue apron as last year." His retail price did not fall in proportion to the Smithfield price. We have no sufficient means to compare the amount of meat sold in each year in the chief markets of England. Again, it would be important if we could have the total amount of Wheat sold in the different markets of England in each month, with the quantity sold in the corresponding month of two preceding years. About March last, I think, the Chancellor of the Exchequer stated, that 10,000,000 qrs. of Wheat had been sold more than at the corresponding period last year. This was a most important fact, showing increased consumption. But how advantageous it would be if every month the *Gazette* enabled us to make a similar comparison respecting consumption with the present and two former years. I find when I sell at a low price that the price I get goes to the inspector of corn returns. When a high price is given, I am told the factor desires it should not be named by the seller, and no return is made of it. This contributes to cheap buying. *Hampshire.*

Dairy Stock.—Various engagements from home have prevented me till this week from seeing your four last numbers of the *Agricultural Gazette*. This is the sole reason of not noticing before this the remarks of "Buffer" in No. 37, page 588. I have re-examined the account. "Buffer" is evidently bewildered amongst the figures of the dairy stock account, extracted from my report on Lancashire farming. He says he should "very much like to see a fair statement of the real average value of a cow per annum." Now, I can assure him that the account in question is strictly one of that nature, being the *bona fide* result of my brother's milk stock at Bamford-hall, near Rochdale. I should be very sorry to insert any hypothetical statement in a work in which I have endeavoured, in all cases, to exhibit the results of practice. The stock kept were the improved Yorkshire short-horns, well fed, and well taken care of. The land has had a good dressing of lime on one part, and of bone manure on the other part. The meadow land was in the highest state of fertility from the quantity of provender purchased, and all the dung applied to it. The meadows were pastured on fine days in the spring till the 1st of May, when they were shut up. In seven weeks a heavy crop of hay was ready to cut. Butter sold from 13*d.* to 15*d.* per lb.; new milk 2½*d.* in summer, and 3*d.* in winter; skimmed milk 1*d.* in summer, and 1½*d.* in winter; butter-milk,

1*d.* per quart. When the seasons were bad, and of course dairy produce not so plentiful, the prices were higher. In 1838, 1839, and 1840, we had cold wet seasons. There were fewer cows kept and less produce sold, but the amount of money made per cow was much the same as in the preceding years. This arose from the prices being higher; but these years were, notwithstanding, the least profitable, because provender was high priced, and more had to be given to the cows to keep the supply of milk, &c., as steady as possible. On an average 12 quarts of new milk produced a pound of butter; consequently near 12 quarts of skimmed milk and butter-milk was sold for every pound of butter, and this in addition to the new milk sold. For instance in 1833 about 84,630 quarts of new milk, skimmed milk, and butter-milk was sold from 28 cows. This will be 3022 quarts from each cow, and 8 quarts per day on an average. It must be recollected here that if any cow fell from her milk too early, from any cause, she was sold, and a fresh calver bought in her place. This will raise the average quantity per cow above what would be the case were the same cows kept over from one season to another. On an average 11 cows were changed every year. This is the system adopted by all the best milk farmers around the manufacturing towns of South Lancashire. I could have given an account for nearly 20 years running [our readers would, we are sure, be uncommonly obliged if you would], but I selected a period including good and bad seasons. I could have given more particulars, but the extra number of figures would only have bewildered "Buffer" still more. I could also have given an account of my own dairy stock kept at Spont Bank, near Bury, and the results, but not so particular in the detail. I kept a stock of Ayrshire cows; the average annual value of produce was about 24*l.*; my farm was a mixed arable and dairy farm; the milk and butter sold in Bury; from my Ayrshire cows 9 quarts of milk would produce 1 lb. of butter. *W. Rothwell, Winwick.*

The proper Management of Water-meadows is a point of first-rate importance, yet it is singular how little accurate knowledge is found among farmers on that subject. I have always understood that it is quite essential to keep up frequent alternations of wet and dry. I was therefore not a little surprised, on looking over a publication of the celebrated William Smith on the subject, to find him directing the water to be kept running over the same spot continually, from October to March, with the exception of two or three sunshiny days. This he states to be the practice in the famous Wiltshire water-meadows—as far as I can understand his not very perspicuous style of writing. I should be very glad to learn from any of your correspondents what is the practice in Wiltshire at the present day. A full description of the management from an experienced hand would, I think, be acceptable to many of your agricultural readers. *Expertus.*

Societies.

NORTH LANCASHIRE, *Sept.* 11: *(continued from p.* 653.*) The Economy of Preparing and Applying Farm-yard Manures, especially in a liquid form.*

The CHAIRMAN said he should like to ask Professor Way one question: Which would be the best time of applying solid manure to a farm? Some people advocated its being applied immediately after the hay had been got off, while some did not advocate its application till autumn or November. Now would it be better to apply it on meadow and pasture land in the autumn or earlier?—Professor WAY: I should advocate its application at once after the hay had been got off.—Mr. GARNETT asked if Mr. Way considered that it was desirable to keep the manure a long time in the tank, or to merely pass it through the tank, and then put it into the ground? Was it better fermented or not? He knew there was a great diversity of opinion upon the subject, and he should much like to have Mr. Way's opinion. He thought he had seen it expressed in print, though he was not quite sure, as Mr. Huxtable's opinion that the unfermented manure was comparatively worthless. He might be mistaken on that point, but he thought that was the expression.—Professor WAY said the question was a very deep one, and it would not become him to answer it at present with any amount of decisiveness. Some experiments, he might say, had been made lately with clay soil, which were very peculiar, and showed that they should approach the subject with considerable diffidence and modesty. If they would take three portions of urine and leave it first in an untouched state, then mixed with sand of its own weight, and again with its own weight of pure clay, they would find that the first one to become putrid and to stink was the one mixed with sand; the next was that portion which had not been mixed at all; but for months and months that which had been mixed with clay remained in a pure state. Supposing the plants feed only in one way, then they must either exist upon the soil with the manure in a fermented state, or with it in an unfermented state. If they put fresh manure, liquid manure especially, into the clay, they prevented that manure from fermenting, and the question would then be, whether it would ever become available to the plant for food, and as yet the question of fermented or unfermented manures was not at all settled. But supposing it were true that the clay had the power of preventing the fermentation, then they were wrong in their view of the way in which the plants took their food, for it could not become food, if, after going into the clay, it did not ferment. On the other hand, when they found fresh manure mixed in a loamy soil, it rapidly fermented if not very dry, and this accounted for his saying they could not decide the question till it had been tried. The practice of feeding sheep on stiff soils had always been objected to, because such soils became poached by the sheep treading upon it. The application of the manure in a fermented state was the most expeditious plan to get an immediate effect, but if they had time he would by all means recommend them to put in the manure in an unfermented state. The unfermented state was decidedly the most economical.—Mr. FORT asked what would be the effect if they mixed the manure with a large quantity of vegetable matter and applied it to the soil?—Professor WAY said that in an ordinary loamy soil it had been tried with a good deal of vegetable matter, and he thought the fermentation took place most rapidly.—Mr. GARNETT: Is the practical result of your answer to my question, then, that the liquid manure may be put in safely in the new state on lighter soils, whereas on clay soils it is rather dangerous?—Professor WAY: I should think so.—Mr. JACKSON asked if they were to understand that the clay prevented, or only retarded, the fermentation of the manure?—Professor WAY said, the experiments which had been tried seemed to him to indicate, if they would take it with that proviso—they seemed to him to indicate that the fermentation of manures, and especially of liquid manure, was retarded when applied upon clay soils, while, by its application upon loamy soils, the fermentation was considerably increased.—Mr. GORNALL then read the following: "I have been a strong advocate for, and participated to some extent in, the advantages derived from the preservation and use of liquid manure for the last 16 years. I have also had another motive in view, viz., a sanatory one. Its preservation takes away a great nuisance from the farm-yard, by having drains laid from the shippon doors, and it adds very much to the comfort and health of the animals, as well as all parties connected with the farm; and further, I consider its value not yet fully known. I have only had a small tank, until the last year, so that in the depth of winter I was obliged to take the liquid out every three weeks or month. I have mostly applied it to my meadows, excepting on one occasion during winter, when the meadows were exceedingly soft from excessive wet weather, I took a quantity on to an Oat stubble, upon which I had a crop of Beans the following year, and notwithstanding the liquid was applied in the depth of winter, it made the crop infinitely of more value than any other portion of the field, although the land was of very uniform quality. I have always found that liquid manure applied to the land in our neighbourhood in the months of November, December, January, February, and March, did not do so much good as in April and May; but I consider that in earlier districts it may be applied a month sooner in the season. In 1847 my landlords rebuilt nearly all my farm buildings, which are now both extensive and convenient, and in 1849 I prevailed on them to make me a new liquid manure tank, in consequence of the old one being much too small. It is built of stone and arched over, and will hold 14,526 gallons, and at 10 lbs. the gallon will be equal to 64 tons, 16 cwt. 3 qrs. The cost to my landlords was about 22*l.* 10*s.*, including the excavation. It is 42 feet 4 inches long, 9 feet 4 inches wide, and 6 feet deep. I, as a tenant, carted all the materials at my own cost, which I consider is the duty of any tenant under similar circumstances; they amounted to about 10*l.* 7*s.*, and for which I calculate I am amply repaid this, the first year, by the extra supply of valuable manure afforded to my meadow lands. It is water-tight, and has to contain what is made from 23 milk cows, one bull, seven heifers, and two piggeries. The liquid manure is quite pure. Last spring I covered eight acres of meadow, and had a very good crop of hay. I applied it in April and May. I feel particularly obliged to my landlords, the Messrs. Rothwell, for their liberality in erecting me suitable farm conveniences, and earnestly hope that all landlords in the county will join their tenants in forming tanks; and I would strongly urge them to make them sufficiently large, as I feel quite convinced that after vegetation has commenced in the months of March, April, and May, the liquid may be much more economically and profitably applied than during any other season. At the same time I do not doubt, where proper convenience may be had for diluting it, that it may be suitably used after Grass has been cut, during any of the summer or autumn months."—Capt. HARRISON had been making a calculation that upon a small farm of about 20 acres there was a loss through the want of the proper receptacles, by the manure running away (not into the turnpike or high road, but into the cart road) of somewhere about 12*l.* a year.—Mr. CHAFFER asked Professor Way whether, where the liquid was drained away into a tank, it was worth the expense of covering over.—Professor WAY said that was not a fair question, for this reason—that he was not supposed to know what the expense would be. As a principle, he should say by all means cover it over, and if they must dilute their heap with it, they should do it at their discretion when they liked, and not let the heavens do it for them when they liked.—Mr. HINDE said he would merely detail to them five years' experience of the use of liquid manure tanks. About five years ago he built his first tank, and he had been in the continual habit of using liquid manure since. He applied it to the land at all seasons; but he certainly preferred applying it to meadow and pasture land in the spring of the year. The first tank he obtained being too small, he was necessitated to empty it whenever it became full; and if this fact was any corroboration of the remarks of Mr. Way, he might say that he had put the liquid upon a clay pasture in the month of November, and at the time he laid it on he had some impression that it would be washed away by the rains into the furrows. He had never expected any result from it; and yet, contrary to his anticipations, there was a manifest improvement in the following year in the land, which before had been in a wretched state. The soil retained its improved condition, he might say, for three years; and in taking strangers over the land, and asking them to stop at those furrows where they could see any change, they did not stop till they came upon that part where the liquid manure had been spread. In applying the liquid to a Turnip crop, he laid it on the moment he perceived it coming out of the ground; and the way in which he applied it was by a sort of conveyance constructed on a small cask, with which he could pour the liquid upon two rows at once. With this cask he could go over 2½ or 3 statute acres in a day, with merely having a boy employed in putting in the liquid. In applying the manure to the Turnip crop at the moment he perceived it coming out of the ground, he found that he almost entirely prevented the fly; and when a shower of rain washed the manure down to the rootlets, it was surprising with what vigour they came on. Some time ago, some portion of a crop of Turnips was omitted to be manured with the liquid, and the fly went away with about two-thirds of that crop, while that which had been manured was not touched. Mr. Hinde then instanced a place where upwards of 500 cows were kept upon a farm of 400 statute acres, and that farm was entirely manured with the produce from the cows, and the wash from a neighbouring distillery. The gentleman occupying that farm cultivated the worst of land; and the whole of it, being irrigated by this manure, was rapidly improving, and would eventually answer very well. To a crop of Italian Rye-grass, and many other things, he was perfectly convinced that the liquid was the life and soul of manure. Mr. Hinde had had experience of the deodorised cesspool manure. He differed with Mr. Smith in throwing into the tubular sewer everything that he could, but by all means he would have the tubular sewers to collect the wash from the houses, and then he would deodorise it. He had since adopted a plan for the deodorisation of the manure, with the assistance of a friend, and he believed there would be a perfect model of it upon the show ground on Thursday. The charcoal which he had used in deodorising was merely the remains of a fire that had taken place in Lancaster some time since, and which he had purchased for the purpose, and he used the bog earth very highly dried, which he found would answer. If they riddled their ashes, and applied a little lime, that would be deodorised quite sufficiently for the purpose; but the peat charcoal was, he believed, a *sine qua non* for the purpose. He had adopted the plan of deodorising the manure for about 18 months, and he found it took all the offensiveness completely away. He had had some Turnips growing in drills which had been manured with the deodorised manure. He had got his man to throw the manure over the crop as much as he could, and these Turnips were decidedly the best of a bad crop. One lot was sown with farm-yard manure, and a portion of deodorised manure, and another lot was sown without the deodorised manure, and the first lot was certainly the best. Mr. Hinde then alluded to the immense saving which might be made by the application of the sewage of towns for manuring the land, as well as the great benefit it would be to the health of the inhabitants.—Mr. LAYCOCK said he had had some little experience, and could furnish the meeting with some observations upon the practice of box-feeding, upon the application of liquid manure, and upon the various subjects which had been brought before the meeting. He thought Professor Way had opened his remarks with box-feeding in contra-distinction to the other modes of feeding. He must say that, as far as economy and saving went, the practice of feeding in boxes was the best. In box-feeding they had the manure covered and saved for a space of five or six months, and the pressure from the constant treading of the animals produced such a firmness that the escape of ammonia or other gases was entirely prevented. The animals, by a little attention being paid to them, might be kept perfectly clean. He might here take occasion to notice that it had been objected to the system of box-feeding, that the animals could not be kept clean in boxes; but he had satisfactorily proved to himself, by three years' experience, that they could be kept clean. It required some little attention to keep the animals clean, but they could be kept perfectly sweet. With regard to the system itself, it was highly important, in the first instance, that the boxes must be properly constructed. They must be made water tight, and there must be no drains from them. A gentleman, talking to him the other day on the box-feeding system, had asked him if he had his boxes well drained, and he might say that draining would be to destroy the very principle of the box system. As he had already said, they must have the boxes, in the first place, water tight, and then they must have a space of about 10 feet square. An area of 10 feet was quite sufficient for one animal to live in from five to six months, but the animal ought to be properly attended to—brushed and curried every morning. He could assure those present that last winter he had from 16 to 18 animals put up in this fashion, and only employed a boy, at about 5*s.* per week, to attend to them. They were fed in the ordinary way, curried once a day, and the place was properly kept in order, which at once did away with the question of expense. The next point he should come to was the quantity of the manure, and as to whether it should be applied fresh from the boxes. That was a matter which entirely depended upon the object for which they wanted the manure. If they required it to produce an immediate effect, then they should have it fermented, and if they wanted it to lay upon the soil some time, and plough it in, it would be better to lay it on fresh from the boxes. If he wanted to sow the seed at the same time as he applied the manure, he would have it carted out from the boxes perhaps two or three weeks before it was to be laid on, so as to allow for its fermentation in the soil, but if he did not want it to produce its effect all at once, he should certainly prefer that it should be carted out of the boxes and ploughed into the soil fresh. With respect to the application of liquid manure, having the boxes open materially lessened the difficulty of getting the manure. Now he thought it very desirable that every farmer should possess upon his farm a liquid manure tank, and one large enough to retain the whole of the liquid manure from all the animals he kept. His experience had led him to make this observation, that to lay the liquid on Grass land was the most economical mode of applying it. It had been objected that the expense of carting the liquid manure was so considerable that it was not worth the labour. Now that depended entirely on the value of the liquid manure, and if Professor Way would tell them the relative value of the liquid manure as compared with a ton of solid manure, that would at once set the question at rest. There was no difficulty in carting the solid manure to any distance upon their farms, and if the liquid was not of sufficient value to cart to any great distance, they could retain it for application upon the land nearer to their farms. But he would contend that there was no difficulty in carting the manure in a liquid state from the tank to the most distant part of their farms, though whether it was worth while to do so was a question which could only be set at rest by knowing the relative value of the liquid and solid manures. A remark had been made by one gentleman during the discussion, that the landlords should provide liquid manure tanks for all their tenants. Now he entertained a different opinion, and thought that it was not exceedingly desirable that the landlords should rush into this expense and lay down tanks all at once, but they should first have meetings such as these, to discuss the value of liquid manure and similar subjects before they came at once to a conclusion. If every landlord in the kingdom were to put down a tank to each one of his farms in the course of twelve months, not one-half of them would be properly used, and it was the proper application of these appliances that made them so useful. He should like to ask their worthy President how many applications he had had from his tenantry for liquid manure tanks, and he would venture to say that those applications had been very few indeed. This proved that the value of liquid manure was not generally known. Though he was quite convinced, from three or four years' experience, that nothing could be so desirable as to set the liquid manure tanks upon a farm, still it would be very objectionable to lay them down, when their use was not properly understood and appreciated. On a farm of about 140 acres, he had had, during the last year, between 20 and 30 cattle fed, and yet he would venture to say, that there had not been more liquid exposed upon it, except by a shower of rain, than now appeared upon the bench where he was standing. The refuse from the houses might be taken into the tanks with the most simple contrivance possible, and then carted on to Grass-land, especially on Italian Rye-grass, with the greatest benefit, provided it was put on immediately after the cutting. He should recommend himself that the liquid manure should be put upon the land on the night of the day on which it was cut; that as it was cut day by day, the liquid should be applied. By that means they would find that the land would be kept in heart, and they would get three crops where they only got one.—Mr. GARNETT said he was sure they were all much indebted to Mr. Laycock, and the other gentlemen who had addressed them that day; and he would make one observation with regard to the advantage spoken to by Mr. Laycock in preserving the manure by feeding the cattle in boxes. That was admitted on all sides to be very good for bullocks and heifers; but he doubted very much, and, in fact, it would be impossible to keep all the milch cows that were kept in this part of the county, and, indeed, over the greater part of Lancashire, on that system of feeding. Perhaps Mr. Laycock would be aware that the cattle kept by the tenant farmers in this county were chiefly milch cows; and he (Mr. Garnett) did not know whether the box-feeding of cattle extended to them or not, but he apprehended that it would be impossible always in this county to keep milch cows in boxes. It was necessary in the spring to turn them out at certain times, day and night, and in winter to keep them up at nights, in the shippon or cow-house. He would ask Mr. Laycock whether the box-feeding system extended to milch cows, or only bullocks and heifers?—Mr. LAYCOCK said it was principally bullocks that were fed upon that system.—Mr. GARNETT continued: That being admitted, and their keeping in this part of the county milch cows chiefly, to preserve the liquid manure they must have tanks. The next question was, how to get that liquid manure kept in the tanks, and how to get it upon the land in the cheapest possible way. Mr. Gornall had mentioned a box put into a cart for conveying the manure to the soil, and that was a very good plan, because the cart, if a mere water-cart, would be kept many months doing nothing, and would suffer in consequence. In this county there were many hills and valleys, and the farm-steads stood upon the slopes of those hills, so that in that case they should consider the most economical mode of laying the liquid upon the soil. He had paid some little attention to discover which was the best mode, and he thought that the most economical would be, to have piping for

the liquid to run through, and a force-pump or a common pump to force it down upon the meadows, and apply it to the land. A boy would guide the pipe wherever it was necessary. He had two or three specimens with him of gutta percha piping, which he believed was a most valuable invention for this purpose. The piece of piping he held in his hand was a portion of one he had used for six or eight months, and he had kept a portion of it in the tank, in order to test the probability of its being injured by the liquid manure. He found that so far it was not injured in the slightest degree, and his belief was that the liquid would not affect the gutta percha piping, but he had a notion that it would last for a very long time. The piping which he then held was about an inch in diameter, and cost about 2*s.* a yard. There was a very simple method of joining it together, so that they could have it in lengths of 20 or 30 yards. There was also another kind of piping—a hose covered with gutta percha inside and out. He had never tried that, but was told that it acted very well. It was about an inch in diameter, coated on the inside with gutta percha, and cost 6*d.* a foot, or 1*s.* 6*d.* a yard. Hose of the same diameter, coated on both sides, cost 7*d.* a foot; that 2 inches in diameter cost 10*d.* a foot, and coated on both sides, 11½*d.* He thought this was a very valuable and important discovery, and it enabled them to lay on the liquid manure whenever they liked with perfect ease, and with a very trifling expense. He would now wish to make a few remarks on the subject of sewage manure. He had with him two packages of charcoal which had been sent to him by Mr. Yarrow, acting under Mr. Jasper Rogers's patent for making peat charcoal. These packages had been sent through the post-office, adding another to the extraordinary list of articles which had been transmitted through that medium, namely sewage manure deodorised by charcoal. This charcoal had been made of peat, and one package was mixed with a portion of foul sewage manure; but the charcoal operated in completely deodorising the manure, and rendered it so that persons could take it away in their pockets. With the unlimited supply of peat which we had in this county, they had really within their reach a fertiliser which ought to make the land most luxuriant. In this county there was a most immense population living on a very small area, and indeed they could not go for 10 miles without coming on some town, and yet they were at a loss to know what to do with the sewage manure produced. At present people were throwing it away, and getting rid of it in whatever manner they could, whereas if they could only convert the peat which existed in the county into charcoal they could deodorise it and make it useful upon the land. This appeared to him the most important discovery that had been made for some time with regard to farming.—Mr. Wilson Patten, M.P., said he had not taken any part in the discussion to-day, and was not going to do so, except to make a remark on one or two things which had fallen from a gentleman present. His object in rising was to propose that they should pass a vote of thanks to Professor Way, Mr. Laycock, and other gentlemen who had favoured them with the result of their experience. Before, however, he did this, he would say, that considering the short time in which the principle of preserving the liquid manure in tanks had been in vogue, he thought Mr. Laycock did not do justice to the farmers, but endeavoured to throw cold water upon them when he asserted that the farmers did not appreciate liquid manure tanks. Now he believed that the contrary was the fact; and he could only say that within the last fortnight he had himself been applied to by seven of his tenants for liquid manure tanks, and at their earnest solicitation he had given orders for seven tanks to be laid down.—(Loud applause.) That was a convincing proof that if the landlords would form these tanks the tenants would appreciate them. He had made a tour in the south of England, in the course of last spring, to look at the manure tanks, and to see how the liquid manure was applied, and in what state it was applied to the land with the greatest benefit. There had been a question raised just now as to whether it should be applied in a fermented state or not, and he must say that he had seen it applied with greatest benefit in a fermented state or Italian Rye-grass, and on Grass lands. On a farm, near London the occupier had a hole in the tank through which he introduced dead animals into the liquid—such as dead dogs and cats, and everything that could induce its fermentation, so anxious was he to get it fermented, and gain a rapid putridity. As soon as the Italian Rye-grass was got off he applied it to the land, and that individual, to his (Mr. P's.) knowledge was now about to cut his seventh crop of Rye-grass since the commencement of the spring. The land was of an inferior nature, being clay mixed with flint, and he was certain he was right when he said the party was now about to cut his seventh crop of Rye-grass since the commencement of the spring.—*Abridged from Preston Chronicle.*

Calendar of Operations.

OCTOBER.

An Essex Farm, *Oct.* 15.—We have finished sowing Tares, and the early sown ones are just coming up well, as we find always the case when they are put in when the land is dry and just skimmed; in ploughing, it does not answer to plough deep on this heavy land. We have also finished sowing Winter Beans; this is the second year they have been tried here, and have given much satisfaction, more particularly this year; they have yielded more than a quarter per acre over the Long-pods, and, coming early, you can get a crop of white Turnips or Rape after them, and either fed off by sheep, with the addition of a little corn or oilcake, is not the worst preparation for Wheat that is practised. The Turnips are now being taken up; Swedes are a bad crop, eaten up by a nasty black grub, as many as five or six in some of them, and mildewed into the bargain; the white ones are somewhat better but not good; they want more wet than we have had in Essex this summer. There is much complaint of the Wheat threshed about here; it does not yield nearly so well as expected. One field that has been well done for some years and looked like 6 quarters an acre up to the beginning of July, hardly reached 4 quarters; the sheep are now picking over the stubbles, and folded at night on some of the Bean land intended for Wheat. The ram has been with the ewes a month now, as we like to have the lambs drop early; they never get up a month lost in the spring. *E. X., near Braintree, Essex.*

Notices to Correspondents.

Act of Parliament: *W S.* Inquiry has been made for you.

Bailiff: *E T.* You may advantageously combine the offices of bailiff and gardener, where the farm is 100 acres only. We speak from experience.

Fingers and Toes, &c.: *Pen.* An unhealthy and stunted growth, owing to the absence of right food for the plant, or the occurrence of an ungenial season during growth. Potato shaws may be added to the dung-heap; they generally are burned in the field. About smear for sheep—your question has been sent into Scotland. About pickles for Wheat, see p. 10 of our vol. for 1849. We use ½ lb. of sulphate of copper per sack, dissolved in water enough to wet every grain of Wheat. They will be dry in half an hour and ready for drilling.

Grass: *Cor.* Alopecurus agrestis. Diligence in the cultivation of a fallow crop, such as Turnips, ought to clean the land of it. Winter Beans are grown already in many parts of Yorkshire

Grass Lands: *M A.* If the land is drained, you cannot do better than apply 2 quarters of fine bone-dust per acre now.

Guano: *R V.* Keep it till the spring. You may make a compost of gas-lime and earth for the bottom of your dung-heap with safety. It is not safe to mix lime and salt to put with dung. Lime alone is bad enough; by letting it act on salt it sets free a still more caustic agent, which will not suffer ammonia to unite with any acid, or assume any fixed form whatever.—We know of no difference between the Grass and the Turnip plant sufficient to point out any difference in the right method of draining the land on which they respectively grow.

Mange: *J L.* Sulphur in powder, ½ oz.; palm oil, 2 oz.; mercurial ointment, ½ oz. Mix well together, and well rub in every second or third day. *W. C. S.*

Manures, &c.: *G S.* You had better litter your cattle with the haulm of the Mustard: and probably you would find in the long run that a careful management of the manure derived from the consumption of Turnips and oilcake will be as cheap a method of fertilising your land as any. If your analysis is correct, the land must be *very* stiff, for 19 per cent. of alumina is a very great proportion. In that case you would improve your land greatly by burning a good deal of the soil. *Good* guano is a cheap manure.

Oilcake: *H T.* You may give the cows a cake per day, that is about 2 lbs. apiece. Break it, and put it in water, where it will, in a day or so, fall abroad; then throw it over the chopped hay. The oilcake will probably affect the milk; "grains" would not.

Peat Charcoal: *M A.* We are not aware at what price Mr. Rogers offers it; but if there be no other hindrance you need be in no fear of any patent (!) hindering your making it.

Sheep-feeding: *M A.* Sir J. S. Menteath's method consists in the use of sheds, 7 feet wide, 5 feet high, 15 feet long; the flooring to be placed on wheels. These sheds would cost 4*l* each and shelter 20 sheep (they cannot be a large breed to allow of that). Plans are given at page 28, vol. 11, Quarterly Journal of Agriculture. We are not aware that this is more than a suggestion: we do not know if it has been tried. It seems a fair subject for experiment.

Straw of Beans: *R W, jun.* If the Beans are cut before the leaves are black, it will make good fodder; but if allowed to become dead ripe in the field, it will be worthless except for litter.

Trifolium incarnatum: *W D C.* It should have been sown immediately after harvest, when it would have been ready in June of next year. It is too late to sow Italian Rye-grass. Vetches should be manured; Rye need not. Common Clover cannot be sown now with any probability of success.

Turnips: *A B B.* They will form useful shoots in spring—but at the expense of the root. We will endeavour to furnish the series of which you speak in our next volume. But the "Gorham and Exeter" warfare, which rages in our bucolics, will not be settled by any addition to the many who are already speaking loud enough in the imperative mood.

Winter Beans: *C.* If the land be clean sow now without manure, if you have not farm-yard manure, and apply 3 cwt. of guano per acre in March, before horse-hoeing.

Erratum: *C L.* Many thanks for your memorandum. The passage in a Leading Article, at pp. 635 and 634, which speaks of the propriety of mixing charcoal dust with urine, must not be taken to imply that there is ammonia ready formed in fresh urine, which would otherwise be immediately lost. Ammonia is the product of the putrefaction which soon takes place in the urine; and the propriety of adding charcoal dust to the fresh liquid depends on the advantage of retaining the volatile products of that decay from its earliest stages.

Markets.

COVENT GARDEN, Oct. 19.

Vegetables are abundantly supplied, and Hothouse Grapes and Pine-apples are plentiful. Peaches are less abundant. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent. Filberts are dearer. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are good and cheap. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce, as are also French Beans. Cut Flowers consist of Heaths, Pelargoniums, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosissima, Japan Lilies, and Roses.

HOPS.—Friday, Oct. 18.

Messrs. Pattenden and Smith report that at Weyhill Fair about 6446 pockets of Hops were pitched, and nearly the whole sold, at prices varying from 4*l.* to 7*l.* 7*s.* per cwt. A large trade was also done in Weald of Kent and Sussex Hops by sample. The market here is firm at full as much money. Duty, 225,000*l.* to 230,000*l.*

SMITHFIELD, Monday, Oct. 14.

The supply of Beasts is unusually large; however, we are still deficient of good quality, and, in consequence, the best kinds are not much lower. Several inferior remain unsold. We have also an increased supply of Sheep and a small demand. Trade is slow, at a reduction of about 2d. per 8 lbs. Calves are not too plentiful, and late rates are pretty well maintained. From Holland and Germany we have 1127 Beasts, 4150 Sheep, 141 Calves, and 300 Pigs.

Per st. of 8 lbs.—s d	s d	Per st. of 8 lbs.—s d	s d

		Pigs 3 0	— 4 4

Beasts, 5463; Sheep and Lambs, 29,140; Calves, 214; Pigs, 600.

Friday, Oct. 18.

The number of Beasts is again very large, and trade extremely dull. Inferior qualities are scarcely saleable, even at the low price quoted; but there is not so much difference in the price of choice descriptions. Although the number of Sheep is not excessive, it is larger than the demand; consequently Monday's quotations are barely supported. We are moderately supplied with Calves; trade is, however, bad, and prices are rather lower. From Holland and Germany there are 483 Beasts, 950 Sheep, 214 Calves, and 16 Pigs; about 350 Beasts from the northern and midland counties; and 98 Milch Cows from the home counties.

MARK LANE.

Monday, Oct. 14.—The supply of English Wheat this morning from the neighbouring counties was small, and taken freely on the terms of this day se'nnight. The arrival from abroad amounts to 33,585 qrs., of which 9685 qrs. are from Dantzic and 6133 qrs. from Rostock; millers abstain from purchasing, excepting where holders are prepared to make a considerable sacrifice; sales have consequently been limited.—Fine malting and foreign Barley is fully as dear, but inferior qualities of English are very difficult of disposal.—Our quotations for Beans are supported.—Peas of all sorts are the turn lower.—Fine Oats meet a good inquiry, but inferior new are very unsaleable, excepting at a slight reduction.

Friday, Oct. 18.—The arrivals of English grain this week have been moderate, those of foreign considerable, and have a depressing influence upon our market, rendering it difficult to effect sales of either Wheat, Barley, or Oats, unless at a slight concession in prices, although there appeared rather an increased inquiry for Wheat.—We observe no alteration in the value of Beans or Peas.—Flour is a slow sale, but not cheaper.—Some transactions have taken place during the week in floating cargoes of Odessa Wheat, at 37s. to 39s., and Galatz Maize at 29s. 6d. per qr.

Liverpool, Friday, Oct. 11.—We have been rather scantily supplied with grain, Flour, and Oatmeal, coastwise and from Ireland, since Monday last, and the import of foreign grain consists of 6756 qrs. of Wheat only; of American Flour, however, we have a further good arrival, and a fair quantity from France. At our market to-day transactions in English and foreign Wheat were upon a limited scale, but holders remaining firm, the genaral currency of Tuesday remains unvaried. Barley, Malt, Beans, and Peas moved rather slowly to consumers, at late prices. Oats not plentiful, and quite as dear as on Tuesday. In Oatmeal no variation. Indian Corn, being still in good request for Irish account, fully supported the amendment of yesterday.——Tuesday, Oct. 15.—There have been fair supplies of Oats and Oatmeal from Ireland since Tuesday last, but they are still small of Wheat and Flour. The trade during the week has been steady, with firm prices generally. The principal alteration in value has been an advance of 6d. to 1s. per qr. on Indian Corn. At this morning's market we had a fair attendance of buyers, and a moderate extent of business in Wheat and Flour. Full prices were obtained for foreign Wheat, and Irish new was fully 1d. per bushel dearer. Flour supported late rates. There was no change in the value of Oats, but Oatmeal was 3d. per 240 lbs. cheaper. Barley, Beans, and Peas were in limited request. The week's advance of 6d. to 1s. per qr. on Indian Corn was maintained to-day, but only two or three small purchases of best American yellow transpired at 29s. per 480 lbs.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

BRENTFORD, MIDDLESEX.

To Noblemen, Gentlemen, Nurserymen, Market Gardeners, and Public Companies engaged in Planting.

MESSRS. PROTHEROE AND MORRIS are directed, by the Executors of the late Mr. J. Ronalds, to submit to public competition by Auction, on the premises, the Butts and Toolands Nurseries, on MONDAY, October 21, and eight following days, at 11 for 12 o'clock precisely each day, in consequence of the number of Lots, without the slightest reservation, the whole of the valuable NURSERY STOCK, riding over 30 acres, which is particularly worthy the attention of Noblemen and Gentlemen laying out their Grounds, as well as the Trade, for its excellence, and comprise several thousand Fruit Trees of the leading and approved varieties, a large quantity of Forest Trees, Ornamental and Deciduous Shrubs, together with a rich assortment of Evergreens.—May be viewed prior to the sale, and Catalogues had, on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT TO SEEDSMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS have received instructions from the Assignees of Mr. Charles Bunyard (a bankrupt), to offer to public competition, by Auction, on the premises (Nash and Hicks's Warehouse, Horsleydown), on THURSDAY, October 31, at 11 o'clock, the whole of the valuable SEEDS and IMPLEMENTS IN TRADE, viz., Sacks, Bags, Weights, Scales, and Measures; a capital Winnowing Machine, Nests of Seed Drawers, &c.—May be viewed, and Catalogues had of Wm. Whitmore, Esq., Official Assignee, Basinghall-street; of Messrs. Marten Thomas and Holland, Solicitors, Mincing-lane, London; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CHERTSEY, SURREY.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. WATERER will sell by Auction, on MONDAY, October 28, and following day, at 11 o'clock, by order of the Proprietor, at Brox, about two miles from the town of Chertsey, and one mile from the Addlestone Station, a valuable NURSERY STOCK, comprising 75,000 Fruit, Forest, and other Trees, Evergreen and other Shrubs, including Spruce and Larch Firs, Birch, Horse Chestnut, Turkey Oak and Holly, Common, Wood, and Portugal Laurels, Arbutus, Lauristinus and Laburnums, Standard, Dwarf, and Climbing Roses, Honeysuckles, Irish Ivy, Daphnes, Clematis and Aucubas, Pears, Peaches, Apricots, and Nectarines, Plum, Pear, and other Stocks, Rhododendrons, Azaleas, Kalmias, and other American Plants, Ornamental and other Flowering Shrubs, 300,000 Bedded and Seedling Quick, and other Stock, the whole of which are in a safe moving condition.—May be viewed one week previous to the sale, by applying to Mr. George Gray, Brox; and Catalogues had on the premises, and of Mr. Waterer, Auctioneer, Land and Timber Surveyor, Chertsey, Surrey.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

SUNNINGDALE AMERICAN NURSERY, near Sunninghill, Berks, two miles from Virginia Water, two miles from Sunninghill Wells, and half a mile from Shrub's Hill.

MR. WATERER will Sell by Auction, on MONDAY, November 4, 1850, and following days, at 11 for 12 o'clock precisely, part of the extensive and valuable NURSERY STOCK of Mr. James Walker; consisting of 25,000 blooming Rhododendrons; Kalmias and Azaleas for Forcing, and many large ornamental Plants; a large quantity of Choice Evergreens and Flowering Shrubs, Dwarf Roses, and Honeysuckles, Standard and Dwarf-trained Apples, Pears, Cherries, Plums, Peaches, Apricots, and Nectarines, of the most approved sorts, Common and Portugal Laurels of all sizes, Birch, Ash, and Oak, Purple and Common Beech, Spruce, Larch, Scotch and Balm of Gilead Firs, of all sizes, a large quantity of Quick, from 3 to 5 years old, and a great variety of other Nursery Stock, well worth the attention of Nurserymen and others, about planting, being in a safe moving condition. N.B.—The above is the produce of Seven Acres, and will be sold without reserve, as the Lease expires at Midsummer, 1851.—May be viewed one week previous to the Sale, and Catalogues had on the premises; of Mr. Charlwood, Seedsman, Covent-garden; and of Mr. Waterer, Auctioneer, Chertsey, Surrey, who will forward them on application, by post, enclosing six postage-stamps.

IMPORTANT AND EXTENSIVE SALE OF NURSERY PLANTS ON ABOUT SIX ACRES.

MR. T. BAXTER is directed to sell by Auction, on TUESDAY, October 29, 1850, and following day, on Bromley Hill Nursery, on the London side of Bromley, Kent, the very superior and well-rooted STOCK OF PLANTS, including about 4000 Common and Portugal Laurels, 4000 Green and Worked Hollies, variegated and other Box, Arbor Vitæ, Yews, Cedars, Arbutus, 4000 Spruce, Scotch, and other Firs, and Forest Trees of every description. 20,000 fine strong Quick, Mulberry, Walnut, Trained Peaches, &c. Valuable and well-budded Camellias, Rhododendrons, and other flowering shrubs and plants. N.B. A lengthened time will be given to clear off the lots. May be viewed seven days preceding the sale, and Catalogues had at the Auction Mart, Bartholomew-lane, London, and at place of sale, &c.

MR. WILLIAM HASLAM begs to announce that he has received instructions from Messrs. Attolander and Co., of Boskoy's, Holland, to Sell on THURSDAY, October 24, and following day, at the Auction Mart, an extensive importation of FRUIT TREES, consisting of trained Peaches, Nectarines, Plums, Apricots, Pears, &c.; also Standard Fruit Trees in great variety, Gooseberries, &c.; Flowering Shrubs, comprising Andromeda, Rhododendrons, Berberis, &c.; also, on each day, a case of Dutch Bulbs.—Catalogues may be had at the Mart, and of the Auctioneer, South Essex Nurseries, Epping.

FIVE HUNDRED CAMELLIAS, TWO HUNDRED ROSES, AZALEAS, LILIUMS, CHRYSANTHEMUMS, TULIPS, IRISES, RHODODENDRONS, AND DUTCH BULBS.

MR. HASLAM will sell choice Specimens of the above on TUESDAY, October 22, and WEDNESDAY, October 23.—Catalogues may be had at the Mart, and of the Auctioneer, &c., Epping, Essex.

RARE AND NEW ORCHIDS FROM THE INTERIOR OF NEW GRANADA.

AN IMPORTATION DESERVING ATTENTION.

MR. J. C. STEVENS has the honour to announce that he will Sell by Auction, at his Great Room, 38, King-street, Covent Garden, on TUESDAY, October 22d at 12 for 1 o'clock, AN IMPORTATION OF RARE AND VALUABLE ORCHIDS, just arrived by the last West India steamer, collected in the interior of New Granada, by Mr. Schlim, traveller to Mr. Linden. Amongst the many rarities contained in this collection may be mentioned Uropedium Lindenii, the most extraordinary Orchid known, the flowers measuring from 24 to 30 inches in length; Odontoglossum hastilabium, and several new and brilliant species; Sobralia dichotama and four new species; Eriopsis rutidobulbon, with gigantic bulbs, the stems growing 2 feet high, covered with from 40 to 60 beautiful flowers; Cycnoches barbatum; a new and beautiful Myanthus; two new and pretty Houlletias; a new genus, bearing large splendid flowers; another very remarkable new genus; Burlingtonia Grenadensis; a new Trichopilia; an Anguloa with beautiful orange-coloured flowers, and several new Oncidiums, Stanhopeas, Warreas, Brassavolas, Mormodes, Epidendrums, &c. To which will be added, several fine specimens of Anguloa Clowesii and Ruckerii, Odontoglossum citrosmum—var. roseum, Oncidium papilio majus, Epidendrum bicornutum, Cattleya Mossiæ, and many other favourite species.—May be viewed on the morning of sale and catalogues had.

TO AMATEUR FLORISTS AND GENTLEMEN ENGAGED IN PLANTING.—SPECIMEN GREENHOUSE AND STOVE PLANTS, STANDARD ROSES, HARDY CONIFERS, &c.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, October 25, at 12 for 1 o'clock, a Choice Assortment of GREENHOUSE AND STOVE PLANTS, including specimen plants of Azaleas, well set with bloom-buds, Ericas, Camellias, Rhododendrons, Corræas, Pimeleas, Ixoras, &c. Also a selection of the best sorts of Standard Roses, Bourbons and Hybrid Perpetuals; and a collection of Hardy Conifers, consisting of Araucaria imbricata, Cedus deodara, Cryptomeria japonica, Cupressus torulosa, Pinus Gerardiana, Abies Khutrow, &c.—May be viewed on the day prior and morning of sale, and Catalogues had.

JAVA ORCHIDS—JUST RECEIVED FROM MESSRS. ROLLISSON'S COLLECTOR.

MR. J. C. STEVENS begs to announce for Sale, by Auction, at his Great Room, 38, King-street, Covent Garden, on TUESDAY, October 29, at 12 for 1 o'clock, an Importation of most RARE AND VALUABLE ORCHIDS from Java, just arrived in Wardian cases, in perfect health; it consists of upwards of 60 fine specimen plants of the beautiful and rare Saccolabium Blumei majus, fine plants of the true Vanda suavis (collected in flower, to ensure their being the correct species), several plants of a new and handsome flowering Aerides (very fragrant, intermediate between virens and quinquevulnerum), fine specimen plants of Vanda tricolor (the best variety, also collected in flower), and a few plants of the new and beautiful Spatoglottis plicata of Blume, red and white species.—May be viewed on the morning of Sale, and Catalogues had of Mr. J. C. Stevens, 38, King-street, Covent Garden, London.

TO CAPITALISTS, ELIGIBLE BUILDING SPECULATION.

TO BE SOLD, 33 acres of LAND, contiguous to a rising sea-port and market town in a western county, adjoining a turnpike-road, with extensive frontage upon which 10 houses of respectable character are already built on leases of 60 and 99 years. There is ample space for considerably extending the town in this direction, and the land being at present let as market gardens, renders it not only an excellent opportunity for speculation by retailing it in lots for building purposes, but also a safe investment of capital. The freehold ground rents of the above 10 houses also for sale.—Apply by letter, directed (prepaid) to S. L., Box 100, Post-office, Gloucester. N. B. A Railway passes very near the property.

TO MARKET GARDENERS, NURSERYMEN, AND FLORISTS.

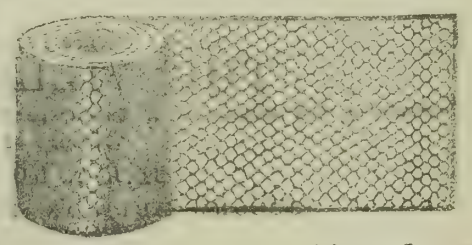
MR. W. T. ATWOOD has received instructions to LET, with immediate possession, the following eligible property, Chiswick-lane, near the Roebuck Inn, on the high road from Brentford to London, and about 4½ miles from London, GARDEN GROUND, containing about 10 Acres, the greater part being walled, and stocked with Fruit Trees and Vines, with a good 8-roomed house, and very convenient Trade Buildings. The Land is well stocked with good bearing Fruit Trees, and cropped with the best kinds of Gooseberry and Currant Bushes, all in full bearing. Proposed Rent and Taxes easy. A moderate valuation of the Under Crops will be required, and the Tenant may have the opportunity of treating with the Landlord for a future Term of holding upon Lease. For further Particulars apply, by letter, to Mr. W. T. Atwood, Auctioneer, Land Agent, and Valuer, Mortlake, Surrey; or, by person, at the Rainbow Hotel, King-street, Covent Garden, on Saturdays from 10 till 1 o'clock, at which place Mr. Atwood meets for the convenience of transacting business. Mr. Atwood has several other Concerns to LET in the Parish of Fulham.

TO SMALL CAPITALISTS, BUILDERS, NURSERYMEN, MARKET-GARDENERS, AND OTHERS.

ELIGIBLE OPPORTUNITY.

TO BE LET, from 30 to 40 acres of LAND (old Pasture to be broken up), on long leases, in suitable lots for any of the above purposes, about one mile from a rising sea-port and market town adjoining a turnpike-road, with extensive frontage. For further particulars, apply by letter, prepaid, to S. L., Box 100, Post-office, Gloucester. N.B. Near a railway station.

PRIORY NURSERY, LARK-HALL LANE, SOUTH LAMBETH.



TO BE LET, for a term of 52 years, the above NURSERY, with a Cottage on the ground; the whole contains four substantial-built Greenhouses, with several Pits and Frames; also a fine assortment of Plants for the ensuing season. A small capital only required, and may be taken with or without the stock. For further particulars, enquire of Mr. Broadbridge, on the Premises.

TO BE LET, with immediate possession, a light land FARM, desirably situate within two miles of a first-class Station of the Great Northern Railway, and within an hour's ride of London; house and premises excellent.—For particulars address, by letter (post-paid), to Mr. Jackson, Estate Agent, Hertford.

TO BE LET, for a term of years, part of the well known FARM OF HALVERSTON, with suitable Farmhouse and Offices attached thereto, situated near the market town of Kilcullen, in the county of Kildare, 25 miles from Dublin, and the property of the late Peter Purcell. The Farm, which is now in the most perfect order, consists of about 250 statute acres of good Tillage and Grass Lands, and 150 acres more can be procured, if necessary. It is three miles from the Curragh and six from the Newbridge Stations, on the Great Southern and Western Railway, and the high road from Dublin passes through it. It is in a ring fence, with suitable offices for accommodating 100 head of Stock in the centre, and a well placed manure pit, and numerous farm roads, would enable the owner to continue the same system of good farming with ease which had been so long the study of the late proprietor. The labourers all live on or near the farm, and there is a police station on the premises; but as labour is plentiful, the district is peaceable, and the rates are low.—Full particulars can be had on application, either by advertisement or otherwise, to Edward Bullen, Esq, 41, Upper Sackville-street, Dublin, by whom every information will be given.

TO BE LET, Furnished or Unfurnished, a small compact COTTAGE RESIDENCE, with or without a convenient lot of small Pasture and Arable Fields, together about 25 acres, situated 7 miles from a county town, and 2 miles from a railway station.—Address, A. Z., Office of this Paper.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1½-inch " light " ...	8 "	6 "
1½-inch " strong " ...	10 "	8 "
1½-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by James Phillips and Co. (the sole agents), 116, Bishopsgate-street Without, London.

THE HIPPOPOTAMUS, presented to the Zoological Society by the Viceroy of Egypt, is exhibited daily at their Gardens in the Regent's-park, from 11 to 4 o'clock. Visitors desirous of seeing the animal in the water are recommended to go early. Admission 1*s.*; on Mondays, 6*d.*

PUNCH'S POCKET-BOOK

THE VILLA GARDENER,

Comprising the Choice of a Suburban Villa Residence; the Laying out, Planting, and Culture of the Grounds, &c.

By J. C. LOUDON, F.L.S., &c.

SECOND EDITION, EDITED BY MRS. LOUDON.

London: WM. S. ORR & CO., Amen-corner, Paternoster-row.

PORTE-FLEURS.—Considering that almost throughout the winter there are generally a sufficient number of plants in flower, scattered about an extensive garden, to compose a pleasing group if collected together, and that these may also be aided so as to form a considerable mass by potted plants brought from the frame or greenhouse, AUSTIN AND SEELEY have lately given their attention to the manufacture of large Bowls, for the purpose of thus concentrating the straggling blossoms of winter in the open ground. Such a PORTE-FLEURS might be devoted, in the summer season, to the choicer kinds of Geraniums, and may easily be kept gay during ten months of the year by merely covering it with a mat during frosty nights. These Bowls, or "Porte-fleurs," of various designs, are made of Mr. AUSTIN'S Artificial Stone, which is waterproof; and vary in price from 8*l.* to 50*l.*—Nos. 1 to 4, Keppel-row, New-road, Regent's-park, London.

IMPORTANT TO ADVERTISERS.—FOURTH YEAR.

In the press, price 6*d.*,

THE AGRICULTURAL ALMANAC AND GARDENERS' and FARMERS' CALENDAR for 1851.

GARDENING DEPARTMENT by a Practical Gardener.

AGRICULTURAL DEPARTMENT by M. M. Milburn, Secretary to the Yorkshire Agricultural Society, author of Prize Essays, &c., &c.

The useful and practical character of this Almanac secures for it a most extensive sale, and therefore renders it a medium particularly suitable for advertising, while its cheapness is a great recommendation. All Advertisements will appear, as they did last year, in each separate edition, without any extra charge.

To ensure insertion, advertisements must be forwarded without delay to D. M. Aird, 340, Strand.

Groombridge and Sons, Paternoster-row, and all Booksellers.

ELEMENTARY CATECHISMS FOR HOME AND SCHOOL.

By the Editors of the "Family Economist."

Price Fourpence each.

The exceedingly low price and superior character of these Catechisms will recommend them to all who are interested in the Education of the Poor. They are also admirably adapted for Elementary Classes in Superior Schools, and for the purposes of Home Instruction and Self-Improvement. Each Catechism contains 64 pages, strongly stitched in neat stiff cover.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

EDWARD DENYER is now prepared to send out his new Descriptive CATALOGUE of Roses, Fruit Trees, Evergreens, Shrubs, Ornamental Trees, &c., which will be forwarded, by enclosing two penny stamps to his Nursery, Loughborough-road, Brixton. E. DENYER informs his friends that he has no Seed-shop in London.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.
American Nursery, Bagshot, Surrey.

DOUBLE PANSY "COMPACTUM."

A. DODS has a fine healthy stock of the above beautiful novelty which he is now sending out at 5*s.* each, or seven for 30*s.*—Rose Hill, Brighton, Oct. 26.

FIRST CLASS SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER.—For a description of this valuable flower, see the *Gardeners' Chronicle* of Saturday, Sept. 7. It is a sterling flower, and will be sure to give the greatest satisfaction. Price 20*s.* each. One over on every three to the trade.
Apply to WILLIAM E. RENDLE and Co.,
Nurserymen, Plymouth.

GEORGE JACKMAN, NURSERYMAN, Woking, Surrey, 1¼ mile from the Woking Station of the South-Western Railway, begs to announce that he has just published a new and complete CATALOGUE of his American Plants, Ornamental Evergreens and Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., which may be had gratis on application.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.
Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Oct. 26.

NOW SENDING OUT.

BECK'S PELARGONIUMS.—The TWO GUINEA COLLECTIONS of Twelve Plants have amongst them RUBY, SARAH, and DORCAS, seedlings not sent out before, but often exhibited in our winning collections. The set may be had in exchange for a post-office order on Brentford, in favour of JOHN DOBSON; package and carriage to London included. They are in 3-inch pots, and wanting an immediate shifting. Catalogues may be had on prepaid application, enclosing one postage stamp.—Worton Cottage, Isleworth.

NURSERIES, CHESHUNT, HERTS.

A. PAUL AND SON respectfully inform their Customers and the Public in general, that their New and Descriptive CATALOGUES of Roses and Hardy Ornamental Flowering Trees and Shrubs are now ready. Applications, enclosing two stamps for the Rose, and one for the Tree Catalogue, will be immediately attended to.

PLANTS FOR BLOOMING IN THE CONSERVATORY IN WINTER OR EARLY SPRING.

MESSRS. J. AND J. FRASER, NURSERYMEN, Lea Bridge-road, Essex, beg to offer the following, finely set with bloom-buds, at the undermentioned moderate prices:

AZALEA INDICA, in fine sorts	...	18*s.* to 30*s.* per doz.
EPACRIS and ERICAS, ditto	...	18*s.* to 24*s.* ,,
RHODODENDRONS, ditto	...	9*s.* to 18*s.* ,,
KALMIA LATIFOLIA	...	9*s.* to 18*s.* ,,
HARDY AZALEAS, including fine Belgian varieties	...	12*s.* to 18*s.* ,,
MOSS AND PROVENCE ROSES	...	9*s.* to 18*s.* ,,
LILACS, GUELDRE ROSES, DEUTZIAS, WEIGELA ROSEA, &c.	...	12*s.* ,,

The above are all beautifully grown, and well established in pots, and are fit for immediate forcing. Remittances respectfully requested from unknown correspondents.

TO THE ADMIRERS OF FLOWERS.

HENRY GROOM, Clapham Rise, near London, by Appointment, FLORIST TO HER MAJESTY THE QUEEN, AND HIS MAJESTY THE KING OF SAXONY, begs to recommend his extensive collection of TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, LILIUM LANCIFOLIUM, GERANIUMS, AURICULAS, and CARNATIONS. He begs to say that this is a good season of the year to make a selection of the various kinds. His CATALOGUE will be forwarded, by post, on application.

CHOICE FLOWER ROOTS, CHEAP.
Carriage free, as see below.

The finest fresh imported HYACINTHS, ANEMONES, CROCUSES, &c., may be had at much less than the usual prices, as under.

Magnificent (Foquett's)	7	6	Nandee (Do.)	5	0

Any 12 of the above may be selected for 3*l.* 10*s.*, or 12 of our own selection, carriage free to London, 2*l.* 15*s.*
(Descriptive Lists will be forwarded on application.)
" 12 new varieties of 1848 for 1*l.* 5*s.*; or 20 varieties for 2*l.*
* 12 fine vars. of previous years for 15*s.*; or 20 vars. for 1*l.* 1*s.*
* For lists of the above see *Gardeners' Chronicle* of October 12th and September 28th.
Remittances requested from unknown correspondents. Post-office orders payable to BASS and BROWN.
Seed and Horticultural Establishment, Sudbury, Suffolk.

AMBROSE'S SEEDLING FANCY PELARGONIUMS.—To be sent out the middle of October, for prepayment only, the first remittance to secure the first selection. Post-office orders are requested to be made payable at Chelsea.

GAIETY.—A small, distinct, and pleasing variety, top petals rich mulberry, with a pink margin, lower petals spotted with the same, a close grower, and very free, the leading fancy flower of the season. 21*s.*

BELLE MARIE.—A fine, distinct flower, smooth, and of fine substance, top petals rich mulberry, margined with crimson, lower petals with the same; constant and free; the only fancy Geranium that obtained a certificate at the Royal Botanic Exhibition of 1848. 21*s.*

NE PLUS ULTRA.—A great novelty, top petals deep crimson, shaded with purple; lower petals much the same colour, having a delicate margin of pale pink, a well-defined white throat, very distinct, the truss having very much the appearance of an Auricula flower; a close grower, and very free. 21*s.*

PERFECTION.—Top petals bright rose, margined with white; lower petals spotted with rosy lilac; free bloomer, constant, and excellent habit. 10*s.* 6*d.*

DELIGHT.—Ground colour blush, top petals having a beautiful pink blotch, and prettily pencilled with rose; fine habit, and free bloomer. 7*s.* 6*d.*

PILOT.—Ground colour white; top petals blotched with mulberry, lower petals having a spot of the same colour on each; fine dwarf habit, and very free. 10*s.* 6*d.*

W. A., having a few packets of Fancy Geranium Seed to dispose of, begs to offer the same at 2*s.* 6*d.* per packet of 40 seeds.
Battersea, Oct. 26.

HART AND NICKLIN, FLORISTS, Guildford, respectfully offer the undernamed PLANTS, strong and healthy, all of which are well known, and established in character:

GERANIUMS.—Rosalind, Star, Emily, Crusader, Field Marshal, Loveliness, Blanche, Mont Blanc 2, Alonza, Victory, Symmetry, and Belle of the Village. 2*l.* the set.

PANSIES.—Juventa, Premier, Polyphemus, Negro, Conductor, Uttoxeter Hero, Lucy Neal, Pre-eminent, Criterion, Gem, Viceroy, Lucy Ashton, Marchioness of Lothian, Helen, Mrs. Beck, Androcles, Heroine, California, Ariel, and Duchess of Norfolk. 1*l.* the set.

FUCHSIAS.—Striata, Unique, Ignea, Multiples, Mirabilis, Sir J. Falstaff, Don Giovanni, Pearl of England. 10*s.* the set.

Parties wishing for a part and not the whole of a set will be treated liberally. No charge for package, and sent free to any station on the South-western or South-eastern Railways.

CAMELLIAS, CHRYSANTHEMUMS, &c.

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, are now sending out healthy young plants, with flower buds, of good sorts of CAMELLIAS, at 30*s.* per dozen, package included. Also good plants, for flowering this autumn, of the best and newest varieties of CHRYSANTHEMUMS, at 12*s.* per dozen, package included.
C. and SONS have also to offer a fine Stock of large plants of China Arbor-vitæ, Hollies, Common Laurel, Box, Scarlet Arbutus, &c., at very moderate prices.

J. AND J. FAIRBAIRN having an immense Stock of remarkably fine FRUIT TREES, trained and untrained, consisting of Peaches, Nectarines, Apricots, Pears, Plums and Cherries, in a large assortment of the most approved kinds; also a very large stock of ornamental Forest Trees, Flowering Shrubs, and Evergreens, on land they are anxious to clear, are induced respectfully to solicit the attention of Gentlemen planting to an inspection of the same, which they intend to offer at such prices for cash as they hope will insure their liberal orders.
J. and J. F. also beg leave to solicit the attention of Gentlemen wishing to furnish Greenhouses, Conservatories, &c., to their stock of Cape Heaths, Epacrises, Chinese Azaleas, Boronias, &c., which is unusually large and fine this season, to which they will affix the most moderate prices, to induce the favour of extensive orders.
Nurseries, Clapham, near London, Oct. 26.

CHOICE FRUITS, &c.—Planters are respectfully informed that YOUELL AND Co. possess an extensive stock of strong and healthy plants of the under-mentioned:
FASTOLFF RASPBERRRY (true), as originally sent out by Youell and Co., 15*s.* per 100.
Large White do., 24*s* per 100.
Cornwall's Victoria, 8*s.* per 100.
CURRANTS.—Improved large White Dutch, 5*s.* per dozen.
Large Black Naples, 6*s.* per dozen.
Raby Castle, or Victoria (red), 6*s.* per dozen.
Knight's Sweet Red, 6*s.* per dozen.
Knight's Large Red, 6*s.* per dozen.
Red Grape, 4*s.* per dozen.
GOOSEBERRIES of the finest sorts, by name, selected for size, combined with flavour, 5*s.* per dozen.
RHUBARB.—Myatt's Linnæus, Mitchell's Royal Albert, and Myatt's Victoria, 12*s.* per dozen.
Youell's Tobolsk, fine, for forcing, 6*s.* to 9*s.* per dozen.
ASPARAGUS.—Giant, strong, 4 years old, for forcing, 5*s.* per 100.
Do. do. 2 and 3 years old, 2*s.* 6*d.* and 3*s.* 6*d.* per 100.
SEAKALE, strong, 1*s.* 6*d.* per dozen.
WHITE THORN, twice transplanted (very strong), 7*s.* 6*d.* per 1000.
Do. 1 and 2 years transplanted, 4*s.* 6*d.* and 5*s.* 6*d.* per 1000.
Do. 4 years, strong and fine, with an abundance of fibrous roots, as good as transplanted, 3*s.* per 1000, or 12*l.* 10*s.* per 100,000.
Apples, Pears, Cherries, Plums, Peaches, Nectarines, and Apricots of the newest and most approved kinds, selected from the gardens of the London Horticultural Society, and warranted true to name, can be supplied in maiden and trained trees of the finest quality, and forward for bearing.
Royal Nursery, Great Yarmouth.

PLANTING SEASON.—NURSERY GROUNDS, RED LODGE, NORTH STONEHAM, NEAR SOUTHAMPTON.—An unlimited supply of every description of FOREST, FRUIT, AND ORNAMENTAL TREES, AMERICAN PLANTS, AND FLOWERING SHRUBS, may be procured from these extensive grounds, at the most reasonable prices, printed Catalogues of which may be had of the proprietor, WM. ROGERS, Sen., NURSERYMAN AND CONTRACTING PLANTER.

Transplanted Forest Trees, 1 to 2 feet, adapted for extensive Forest or Coppice Planting, usually sold by the thousand; and also of a large size, for Ornamental Planting, or immediate effect, from 3 to 12 feet, the prices varying from 25*s.* to 5*l* p. 100.
Ash, Beech, Birch, 15*s.* to 30*s.* per 1000; Spanish Chestnut, 20*s.*, 30*s.*, and 40*s.*; Larch Fir, 7*s.* 6*d.* to 20*s.*; Spruce, 20*s.*, 30*s.*, and 40*s.*; Scotch, 10*s.*, 15*s.*, and 20*s.*; Pinaster, 10*s.*, 15*s.*, and 20*s.*; Sea Pine, adapted for exposure to the sea, 15*s.*, 25*s.*, and 40*s.*; Mahonia, for cover, 40*s* to 80*s.*; Hazel, 15*s.*, 20*s.*, and 35*s.*; English Oak, 15*s.*, 20*s.*, and 40*s.*; Poplar, 20*s.*, 30*s.*, and 40*s.*; Quicks, 5*s.*, 7*s.* 6*d.*, and 10*s.*
Planting contracted for to any extent from 5*l.* to 20*l.* per acre.

ORNAMENTAL TREES AND SHRUBS.

Rhododendron ponticum, 2 to 6 inches, 20*s.*, 40*s.*, and 80*s.* per 1000; 1 foot, single stems, fit for working, 10*s* per 100; 1½ to 2 feet, strong, 20*s.* to 40*s.* per 100, fit for planting out at once to cover; 4 to 6 feet, single stems, for working the beautiful scarlet and other fine kinds, 50*s.* per 100. Tree Rhododendrons may thus become as generally cultivated as Tree Roses. Scarlet Rhododendrons, 18*s.* per dozen; hybrid scarlet, lilac, and white, with large handsome trusses of flowers 4 to 6 inches, 25*s.*; 1 foot, 40*s.* per 100; Kalmia latifolia, 2 to 4 inches, 8*s.* to 12*s.* 6*d.* per 100; 1 to 2 feet, blooming buds, 50*s.* per 100; 2 to 3 feet, fine, 75*s.* per 100; Epigæa repens, 50*s.* per 100; and all other American plants at equally low prices.
Dwarf Rose Stocks for working, 8*s.* per 100; Single Camellias, 25*s.*, 40*s.*, and 50*s.* per 100, fit for working; Double Camellias, of sorts, on own roots, 6 to 9 inches, 12*s.* per dozen; Pinus (Abies) Douglasi, from seed, 6 to 9 inches, 10*l.* per 100 or 30*s.* per dozen; Arbutus, 12 inches, 8*s.* per 100; 1½ foot, 20*s.* per 100; 2 feet, 30*s.* per 100; Laurel, 8*s.* to 20*s.* per 100; Laurustinus, bedded, 40*s.* per 1000, 8*s.* per 100; Variegated Holly, 1 foot, 25*s.* per 100; Clematis azurea grandiflora, 6*s.* per dozen, 42*s.* per 100; Deutzia scabra, 2 feet, 12*s.* 6*d.* per 100; Common China Rose, 12*s.* 6*d.* per 100; Tree Roses of the most select kinds, 5*l.* per 100; Dwarf Roses, 50 sorts, named, 50*s.* per 100; Double White, Double Red, and New Crimson Thorns, 40*s.* per 100, 6*s.* per dozen; Large Dutch Honeysuckles, 12*s.* 6*d.* per 100; Giant Irish Ivy, 8*s.* per 100.
The prices are for wholesale, if ordered in less quantities a higher price will be charged. All orders above 5*l.* carriage paid to London.
American purchasers will find great advantages in procuring their supplies from these grounds, from their proximity to the Docks whence the American steam-packets take their departure, thus saving the delay and expenses of Land Carriage.

WM. FOSTER, Nurseryman, Seedsman, and Florist, Stroud, Gloucestershire, has a large stock of good transplanted LARCH of various sizes to offer; prices will be given on application, with samples if required.

N.B. W. F. has a choice selection of Fruit trees for walls, orchards, &c. Also Seeds, &c.

FOR SALE, 250 PINE PLANTS, the property of a Gentleman; consisting of 100 Fruiting Plants, 20 in Fruit, 100 successions, and about 50 Crowns and Suckers. The greater part are Black Jamaicas, are in excellent condition, and perfectly clean.—For particulars apply to R. Mackay, Stoke Newington London.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD SUSSEX.

THE PLANTING SEASON being near at hand, WM. WOOD and SON respectfully inform their friends that their stock of ROSES is this season more extensive than ever. In addition to the above, the Nursery abounds in every description of SEEDLING AND TRANSPLANTED FOREST TREES; also American, Evergreen, and Flowering Shrubs, Ornamental and Fruit Trees, &c., &c., well worthy the attention of gentlemen planting.

Catalogues will be sent free on application.

TRUE DOUBLE ROMAN NARCISSUS, 3s. per dozen. The most fragrant and earliest flowering of all the Narcissus. ROBERT HALL begs to advise the arrival of his Annual Importation of the above-named BULBS, in fine healthy condition. Also, fine Dutch HYACINTHS 6s. per dozen, or 3 dozen for 15s. Crocus, Jonquils, Tulips, &c., at his Foreign Warehouse, 63, South Audley-street, Grosvenor-square, facing the Chapel. Priced Catalogues may be had by post, and postage stamps taken in payment.

HYACINTHS AND OTHER ROOTS.

RENDLE'S NEW PRICED CATALOGUE OF BULBOUS ROOTS

Is just published, and can be had on application, gratis. It contains a DESCRIPTIVE *List of all the best Hyacinths, Tulips, Iris, Ranunculus, Anemones, Crocus, Liliums, Gladiolus, Ixia, &c, with some excellent* CULTURAL ADVICE *as to the best method of growing them. It will be found of great service to all growers.*

The "Collections of Seeds" sent out by us having given such universal satisfaction, we have been induced to offer the following "Collections of Roots," which we are certain will please every purchaser.

For the List of Roots contained in the Collections, see our new Book Catalogue.

COLLECTIONS OF BULBS.	£	s.	d.
No. 1 Collection, all the most approved sorts ...	3	0	0
No. 2 Collection, containing smaller quantities ...	2	0	0
No. 3 Collection, for a small Garden	1	0	0

For details of Collections, see Catalogue.

100 Hyacinths in 100 very fine sorts, Purchaser's selection	3	0	0
100 Hyacinths in 50 fine sorts, Purchaser's selection	2	10	0
50 Hyacinths in 50 superior sorts ditto ...	1	10	0
50 Hyacinths in 25 superior sorts ditto ...	1	5	0
24 Hyacinths in 12 superior varieties ditto ...	0	12	0
12 Hyacinths in 12 superior varieties ditto ...	0	6	0

Where the selection of Hyacinths is left to W. E. R. and Co., they request to be informed whether they are intended for water, pots, or the open ground; also whether single or double Hyacinths are preferred. When the choice is left to them they generally send about two-thirds double, and one-third single, which gives a greater variety. Purchasers may rely upon really good sorts being selected when the choice is left to ourselves, and we will guarantee to give them satisfaction.

For Catalogues, and further information, apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

N.B. Our Hyacinths and other roots have just arrived from Holland in excellent condition.

FIRST CLASS CRIMSON BIZARRE CARNATION.

WOOD'S "SOUTH LONDON," which was awarded a First Class Certificate at the Royal South London Show in 1849, and received the highest encomiums from the floricultural press at the time, is now ready for sending out. Being above the average size, it will be found a first-rate flower for showing in collections, as well as single blooms. Price, 10s. per pair, postage free.

Also WOOD'S "MR. HERBERT," a first class heavy-edged purple Picotee, at 5s. per pair, postage free.

Cash with orders from unknown correspondents is respectfully requested.—WOOD and INGRAM, Nurseries, Huntingdon.

NEW GERANIUMS, CINERARIAS, &c.

BENJAMIN R. CANT, St. John-street Nursery, Colchester, begs to offer strong, handsome, healthy plants of the undermentioned, feeling confident they will give entire satisfaction.

" arborea papaveracea, each	2	6
RIBES.—6 fine flowering varieties	5	0
HARDY SHRUBS.—12 new and select varieties ...	15	0

Goods free to London, and, for long carriage, extra articles presented. Remittances requested from unknown correspondents. Post-office orders payable to Stephen Brown, or to Bass and Brown, Seed and Horticultural Establishment, Sudbury, Suffolk.

REWARD.—ALEXANDER RUSSELL, supposed to assume the name of James Alexander, a gentleman's Gardener, formerly in the employ of George Robins, Esq.; then in the service of E. Braude, Esq., of Turnham Green; then with Lord Lonsdale, of Barnes, Surrey; and latterly with B. Lumley, Esq., "The Chancellors," Hammersmith. The said Alexander Russell is a native of Scotland, speaks with a broad accent, is about 55 years of age, 5 feet 6 or 7 inches in height, round shoulders, sandy whiskers, and a downcast look. Any person giving information as to his place of residence, if living, or place of burial, if dead, will be handsomely rewarded. Apply personally, or by letter addressed to H. F., Mr. Luff's, Bootmaker, Kew, Surrey.

TO GENTLEMEN PLANTING FRUITS, AND TO THE TRADE IN GENERAL.

JOHN BELL, having disposed of his Nursery Business, begs to offer the remainder of his fine healthy Stock of FRUIT TREES, at the following low prices, having only a short time to clear the Ground:

Catalogues will be sent by inclosing one penny stamp J. Bell's, 3, Exchange-street, Norwich.

A remittance requested from unknown correspondents.

Strong 4-year-old Whitethorn, 2s. 6d. per 1000, in large quantities.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—Viola Arborea, or the Perpetual Tree Violet (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by Edward Tiley, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6s. per dozen; smaller ditto, 3s. per dozen; or 1l. per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2s. 6d. each; or smaller ditto, 1s. 6d. each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well-rooted plants at 3s. per dozen.

True BATH COS LETTUCE SEED, 1s. per packet.

Extra fine SWEET WILLIAM SEED, saved from 24 distinct varieties, 1s. per packet.

ANTIRRHINUM SEED from all the best varieties, 1s. per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2s. 6d. per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by Edward Tiley, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

TO NOBLEMEN, GENTLEMEN, AND PLANTERS IN GENERAL.

WILLIAM YOUNG, Nurseryman and Contracting Planter, begs to inform persons engaged in Planting, that his extensive Stock of FOREST TREES, EVERGREENS, and HARDY ORNAMENTAL TREES and SHRUBS, is this season finer than it has been for many years past. The Forest Trees consist of strong bedded Alder, Ash, Beech, Birch, Spanish Chestnut, Hazel, Red-heart Willow, Scotch and Larch Firs, &c., all 2 to 3 and 3 to 4 feet high. A large quantity of English Oak, from 3 to 8 feet high, very fine.

The Evergreens comprise large Spruce, Silver, Weymouth, Scotch and Larch Firs, from 6 to 12 feet, well grown, and will remove with safety; common and Portugal Laurels, Green Hollies, American, Chinese, and Siberian Arbor-Vitæ; Pinus maritima, austriaca, and other Evergreens in great abundance. About 500 Quercus sessiliflora or Fir Oak, about 6 feet in the stem, with fine heads; will remove with safety; they are well adapted for avenues or park scenery.

Gentlemen planting new places or improving their estates will do well to apply to Mr. Y., as he has had considerable experience in planting in all its branches, and from the quantity of large Evergreens he grows is enabled to contract to any extent at a very reasonable rate.

Mr. Y. has also a very fine collection of Coniferous plants, from 2 to 4 feet, and large specimens, consisting of Cedars Deodara and Lebanon; Araucaria imbricata, Cryptomeria japonica, Taxodium sempervirens, Pinus insignis, Abies Douglasii, &c., of which he would invite a personal inspection.

His priced Catalogue is now ready, and can be had, on application, for two postage stamps.

An immense quantity of strong bedded Whitethorn or Quick for Fencing and Mahonia aquifolium, or American Berberry, for cover, which will be sold cheap if taken in quantity.

Milford Nurseries, near Godalming, two miles from the Godalming Station of the South-Western Railway, where conveyances can always be obtained.

TO SMALL CAPITALISTS, BUILDERS, NURSERYMEN, MARKET-GARDENERS, AND OTHERS.

ELIGIBLE OPPORTUNITY.

TO BE LET, from 30 to 40 acres of LAND (old Pasture to be broken up), on long leases, in suitable lots for any of the above purposes, about one mile from a rising seaport and market town adjoining a turnpike-road, with extensive frontage. For further particulars, apply by letter, prepaid, to S. L., Box 100, Post-office, Gloucester. N.B. Near a railway station.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s.* per 100.

Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s.* 6*d.* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 20*s.* per 100.—Manor Farm, Deptford.

LARGE SURPLUS STOCK OF FOREST TREES, SHRUBS, &c., NOW ON SALE AT RENDLE'S NURSERY, PLYMOUTH. ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., PLYMOUTH, *have a large SURPLUS STOCK of the following TREES and SHRUBS; and as the ground is required for other purposes, they will be sold at the following low prices:*

*** CARRIAGE FREE (See below.)

THORNS OR QUICK.—10,000 fine transplanted Thorns, from 12 to 15 inches high, for 3*l.* 10,000 one-year old Seedlings, at 1*s.* 6*d.* per 1000.

LARCH FIRS.—We have a very large stock of fine stuff, about 3 feet in height; the price will only be 18*s.* per 1000 if 5000 are taken.

TURKEY OAKS.—Fine, handsome, well-selected trees, well transplanted, 80*s.* per 1000, worth at least 20*s.* per 100.

BERBERIS AQUIFOLIUM.—A large quantity of fine stuff, 18 inches, 16*s.* per 100. This is a fine Shrub for underwood.

SCOTCH FIR.—Large stock of fine stuff, 24 to 30 inches in height, 18*s.* per 1000, if 5000 are taken.

PINUS AUSTRIACA.—We have an extensive stock of this valuable tree, of the finest possible growth, 12 to 18 inches, fine and stout, 35*s.* per 1000.

RHUBARB: MITCHELL'S ROYAL ALBERT, *the earliest of all.*—We have more than a thousand strong roots, 15*s.* per dozen. *These will produce abundantly next Spring,* if planted now.

RHUBARB: MYATT'S VICTORIA, very strong roots, 15*s.* per dozen; smaller ditto, 9*s.* per dozen. YOUELL'S TOBOLSK, 3*s.* per dozen.

RASPBERRIES: RENDLE'S LARGE BEEHIVE.—This is a large handsome variety, very prolific, delicious flavour, and has given the most complete satisfaction to all. Strong Canes, 20*s.* per 100; 3*s.* per dozen.

YOUELL'S FASTOLFF, 10*s.* per 100.

STRAWBERRIES: KITLEY'S GOLIAH, 3*s.* 6*d.* per dozen; 20*s.* per 100. CUTHILL'S BLACK PRINCE, 2*s.* per dozen; 10*s.* per 100. *All the following excellent sorts at* 3*s.* 6*d.* per 100: Myatt's Eliza, Mammoth, British Queen, Globe, Prolific, Victoria, Cooper's Seedling, Elton, Keens' Seedling, Cole's Prolific, Deptford Pine, and Roseberry.

SEAKALE AND ASPARAGUS in large quantities, very reasonable.

BEST DOUBLE RUSSIAN MATS, 5*l.* per 100.

BLACK NAPLES CURRANTS, very superior to the old sort, 6*s.* per doz.

GOOSEBERRIES.—Some of the best known, 30*s.* per 100.

ARBUTUS.—Fine plants in pots, 12 to 18 inches, 5*s.* per dozen.

ILEX OAK.—Fine plants, *in pots,* 18 to 24 inches, 5*s.* per dozen, worth 10*s.* per dozen.

CEDRUS DEODARA.—Fine stock of nice young seedling plants, two years old, in pots, 6*s.* per dozen.

Our Autumnal Catalogue of Forest Trees, Shrubs, and Fruit Trees can be obtained for one penny stamp.

All orders above 5*l.* will be delivered CARRIAGE FREE to any Station on the Great Western, Bristol and Exeter, or South Devon Railways; or to Cork, Dublin, or Belfast. Steamers from this port to Cork, Dublin, and Belfast twice a week.

The South Devon Railway is now open to Plymouth; the station being within one minute's walk from our Counting-house.

FIRST ORDERS WILL HAVE THE PREFERENCE. ALL ORDERS WILL BE EXECUTED IN STRICT ROTATION.

WILLIAM E. RENDLE and Co., Nurserymen, Plymouth. Established 1786.

The Gardeners' Chronicle.

SATURDAY, OCTOBER 26, 1850.

STRANGE as are many of the effects produced in plants by parasitic fungi, none perhaps is more so than the enormous development of the different parts of Indian Corn when attacked by the MAIZE SMUT. It is not quite certain that the peculiar disease described by SCHWEINITZ is identical with the European malady, but from specimens received from South Carolina we believe it to be so, and if this be the case the excrescences are sometimes as much as 2 feet long. Be this however as it may, the protuberances in the common Maize smut are sufficiently surprising. Every part of the plant is liable to be attacked. The stem, upper leaves, and especially the bracts, become immensely swollen under the attacks of this malady, and the ovaries, ovules, and male blossoms are not exempt. BONAFOUS records a case in which even the filiform pistils were swollen to the thickness of a Wheat stalk.

The parts affected are at first white or tinged with red, smooth, and juicy; the cellular tissue becomes greatly increased in volume, and is soon traversed by dark irregular radiating lines, consisting of mycelium and spores in different stages of development. The structure is in this state easily made out, the parasite being composed of short, irregular, and, sometimes knotted, colourless threads, springing up in the intercellular passages, or within the cells themselves, and gradually giving rise to globose or slightly elliptic spores, which are minutely echinulate, and exhibit frequently a regular globose nucleus, but sometimes appear nearly uniform under the highest magnifying power. These spores are about twice as large, in linear measure, as those of the common Oat-smut. The smut-balls, at a certain stage of growth, pour out, when torn or ruptured, a large quantity of black fluid, which has a peculiar disagreeable somewhat pungent smell, and contains spores, decomposed cells, and fragments of mycelium. At length, when the abundant moisture is absorbed, or discharged by some lateral aperture, the spores, remaining within the dry skinny envelope, present a dusty mass mixed with irregular threads, which consist of the withered vascular and cellular tissues of the parts which were originally interposed between the portions immediately infested with the fungus. If the smutty mass remains long in a moist state, it is itself subject to be infested with species of Mucor and other moulds.

In some parts of France and Italy whole fields are destroyed by this gigantic pest, and nothing can exceed the disgusting dust where a crop is highly infected. We have seen no British specimen before the one of which we have given a representation, which was sent to us from Little Canford, and was the only one in a fine crop of about half an acre. In this case the disease is confined principally to the lower bracts, causing them to swell from the size of a nut to that of an Apple. On one of the bracts two tubercles project from the under surface, as large as, and shaped like a Filbert, though the rest of the tissue is quite sound. Some of the ovaries, also, are affected, though the greater part of the spike shows no symptoms of the disease; in one case either an ovary or axillary bud has swollen to such a degree as to burst its corresponding bract.

The anthers of Maize have not at present been observed to be attacked by this disease, but M. AYMEN speaks of apparently another malady to which they are subject, and which causes them to swell immensely, and to give out at last a brown or black dust. Under these circumstances the female spikes are never attacked, and perfect their seeds from impregnation with the sound pollen of other plants.

We have not figured the general appearance of a plant affected with *Ustilago Maydis*, in consequence of the large space which it occupies; but the accompanying cut represents highly magnified views of the nascent mycelium and the more or less perfect spores. *M. J. B.*

THE approach of winter brings, as usual, many inquiries as to the manner of LAYING OUT GARDENS. One correspondent wants to know what to do with half an acre; another is perplexed with his dozen. Should a tree be placed here? Shall an opening be made there? Would a rockery look well in that corner? Where can I stow away my Roses? How shall I carry a walk round a square piece of ground? A thousand such questions arise, but they are put in vain to those who are not on the spot to advise; for it may be taken as a general truth, that mere details of arrangement can never be settled except upon personal inspection, and a full knowledge of all the circumstances that may aid or injure a given operation, either in winter or summer. Plans on paper are useful as guides, but beyond an indication of the general nature of a design, they are worthless. A strict adherence to a plan on paper has wholly ruined the effect of many a place which the genius of the landscape-gardener, applied upon the ground, would have rendered charming. Hence it is of the first importance that everybody should make himself acquainted with those general principles, or truths, which long experience has shown that we must observe, if pleasing or picturesque gardening is the object.

It is, therefore, with much satisfaction that we can point to a well-timed and excellent little work by Mr. KEMP,* in which is collected with care, and arranged with clearness, almost every thing that it is necessary to understand in deciding upon the arrangement of garden ground. How much it is wanted is evident when we look at the hideous deformities that surround us—from the Cockney ruins of Mr. A., and the crinkum crankums of Mrs. B., to the wretched fountains (?) in Trafalgar-square, and the disgraceful ugliness of Victoria Park. Mr. KEMP may, we believe, be taken as an expounder of the views entertained by Mr. PAXTON on this subject; for he was long employed at Chatsworth, and had the management under him of those great operations in Toxteth Park and at Birkenhead, which are among the very few public parks that an Englishman can point to without shame for his country.

One advantage which we are glad to perceive that Mr. KEMP's book affords the reader, is the precision with which he directs *how* work is to be done, and *how* effects are or are not to be produced. It is easy enough for gentlemen with a wave of the hand, and a *sic volo sic jubeo* gesture, to command this to be put in one place, and that to be carried out in another; but they would find their ideas materially expanded, and their expectations greatly rationalised, if they would take the trouble to make themselves, in the first instance, acquainted with possibilities, and with the means that are available for bringing about results. In this respect Mr. KEMP will be found a safe and useful guide. For example, the following remarks upon grouping plants, a principle admirable in itself, but carried to a ridiculous extent by a late landscape gardener, puts this part of the subject in the only point of view in which it deserves to be considered.

"To produce strong and striking effects in a garden, there must be not merely a tolerably varied collection of plants, well mixed up together, and disposed so as to give variety and contrast, but *groups of particular kinds* should be planted in prominent places, that occasional broader masses of a peculiar form or colour may be obtained. From three to six or even eight specimens of some showy kinds may thus be planted in an irregular group, at any jutting point in a bed, or on some swell of a mound, and will create a very striking impression by their foliage or flowers. They should be placed near enough to each other to grow into a thicket, without injury to any of the plants, that only one dense mass of heads, and none of the individual stems may be seen, and that the effect may be more like what one immense specimen would yield.

"This system of arrangement, combining the advantages of massing plants of one sort, without any of its evils, is well worthy of being more freely pursued than it is at present. A group of pink or crimson Rhododendrons of one kind, that will bloom all at once; of *Berberis aquifolium*, for both flowers and fruit; of the red-flowering Currant, which is all the gayer for appearing so early; of Laburnums, the English and Scotch varieties being mixed; of common Lilacs; of the *Cydonia japonica*, with only about three plants; of yellow or mixed Azaleas; of any bright or dark-flowering sort of Rose; of *Daphne laureolus*, for its form and scent; or even of common Dogwoods, which are particularly attractive in autumn, when the leaves begin to change colour, and are well fitted for clothing small islands; of Tamarisk, overhanging the steep face of a mound; of Broom, in the more open part of an outside plantation; of Savin, Heath, or *Cotoneaster microphylla*, or *Gaultheria shallon*, where a tuft of dwarf plants is wanted; and, not to multiply examples further, of any variegated, or pale green, or silvery-leaved variety that does not grow too large;—will add a novel and most inviting feature to a garden, and make it very conspicuous at particular seasons.

"For the still lower tribe of plants, and even for annuals, the plan is fully as suitable. Every one is now aware what splendid displays are created by the various kinds of half-hardy plants with which gardens may be decorated in masses during summer. Some things, in fact, which would, when solitary, be almost contemptible, acquire a marked showiness if collected into a group. And many annuals, that are straggling and poor as individual objects, become, in broad patches (which is the best way of growing them), highly ornamental and handsome."

So again, in directing how artificial embankments can be best executed, we have some highly judicious advice, of which the public hardly suspects the importance.

"In shaping," says Mr. KEMP, "the outlines of any raised masses of earth, a correct and practised eye will be the safest guide. Nevertheless, it may be remarked that all the more prominent and higher points should also be the fullest, and the roundest, and the steepest, while the retiring parts can be scooped out and sloped back into a kind of hollow basin. This is the shape almost universally found on the face of natural hills, where fulness and precipitancy are the common attendants of the more

* "How to Lay Out a Small Garden;" intended as a Guide to Amateurs in Choosing, Forming, or Improving a Place (from a Quarter of an Acre to 30 Acres in extent), with reference to both design and execution. By EDWARD KEMP, Landscape Gardener, Birkenhead-park. London: BRADBURY and EVANS, 11, Bouverie-street.

forward projections, but are seldom or never seen in the recesses. The reverse of all this, in gardening, is among the worst features that can be introduced. Concavity should be rigidly adhered to in all the receding portions of mounds.

"Undulation of surface is as important in most mounds as freedom of outline, only this should be proportioned to the scale on which they are formed. Such mounds as can be at all fitly introduced into small gardens, will, from their limited extent, admit of only very trifling undulations, or they will thereby become all the more artificial instead of natural, and be simply absurd. For a varied and irregular ground outline, however, consistency demands some little variation and play in the surface line; and a bank that is slightly undulated will look much less formal and unnatural.

"In conformity with the shaping of the ground line or face of a bank, its retiring or narrowest parts should be the lowest, while the fullest parts are also the highest. And if, as is most proper and beautiful, a straight line drawn through the face of the bank, parallel with the back, or taking its general direction, would leave no two of the different swells or bays at *exactly* the same distance from it; so a similar horizontal line should show the like irregularity. Even 2 or 3 inches of difference in all the various hollows or elevations of surface will have a powerful effect in carrying off every kind of dulness, and imparting a graceful freedom. Should a bank be tolerably broad, there may be partial undulations across as well as along its surface in the wider parts. Then, the front swells should be made roundish, and fall away to hollows connected with the depressions in the narrower parts, rising again to a more flattened elevation towards the back. Or, for variety, the back part may be kept highest, and slope away into the same hollow as before, treating the projecting front as a flattened arm of the general mass.

"What I have thus described, in terms which might lead to the supposition that considerable variations of surface were contemplated, refers simply to such as can be compassed on a comparatively small bank, and on a scale of inches in change of height rather than feet. Nothing need be less beautiful because it is small; and the rules of taste embrace the least as well as the greatest things. Nor will there be a seeming pretension about the adaptation of such rules as this, in reference to the smallest mounds."

Let us hope that the appearance of this little work will be the commencement of an entire reformation in the decoration of middle class gardens and pleasure-grounds; and that there also we may find the taste and judgment which have rendered some English Palatial gardens the admiration of everybody; for nothing can be more true than the author's assertion, that *the rules of taste embrace the least as well as the greatest things*.

Those who wish for plans and more detailed instructions upon such a subject, will find them in abundance in Loudon's *Suburban Gardener*, of which we perceive that a new and greatly improved edition has been just published, under the name of the *Villa Gardener*, with between 300 and 400 plans and designs for gardens of all sorts and sizes.

As enquiries for the Stanwick Nectarine are now becoming numerous, it is desirable to state that in the course of the winter a considerable number of young trees, propagated by Mr. Rivers, will be sold by auction, of which due notice will be given in ample time. *None will be sold by private contract.*

HOW TO MISMANAGE A GARDEN.

Chapter XII.—Groundwork will now tax your ingenuity. People may think that the mere act of moving ground is one which is beyond the skill of anybody to manage badly. Be assured that this is a great mistake. Amateurs are particularly clever at making a mess of groundwork, and some young and green gardeners are not far behind them. Certainly, if gardening is an amusement, the ways of such gentlemen are sufficiently ludicrous.

In the first place, buy the lowest priced tools you can find; cheap ironmongers may be found in most places. Tools are expensive articles, and it should be an object to diminish expenses, especially such as are out of sight. As tools are to be used, not looked at, you will exercise your taste in picking the nicest looking articles you can find. Uncommonly pretty things, light and handy looking, are turned out, for the use of amateur emigrants and gentlemen gardeners. A knife fashioned out of iron hoop looks quite as well as one of steel. A mattock of cast-iron will hardly be known from one of the best temper until you come to use it. Wheelbarrows of clean white wood, when painted, are even lighter and prettier than those of Ash, and Oak, and Elm, ever so cleverly combined; you may buy the first for half a sovereign, you may have to pay a guinea for the last. The practical advantage of cheap tools is far too evident to require much illustration. Some soon wear out; and then you can buy more; others bend, and that makes a job for the blacksmith; most of them lose their handles after a few weeks' wear, and the wheelwright may get something by rehandling them; a good many break, and there's an end of them. In this manner a clever mismanager will contrive to want a fresh outfit of tools at least every season.

Russia mats should always be looked after where they can be had for less than cost price. Plenty are in the market at half the expense which people charge who are called honest only because they deal fairly, taking a just tradesman's profit, and giving their customers what is worth the money. A bad manager has nothing to do with such folks; in Russia mats, especially, he may make a capital bargain, if he looks sharp. It is not very long since a sagacious gentleman who builds barges obtained from a friend a hundred of these mats for 4*l.*, when the market price was 5*l.*; they were put into use in October, and in December they were wheeled to the rubbish heap. By the time the four pounds worth of mats was rotted down, the gardener had a cheap lot of manure very nearly as valuable as saw-dust.

Having provided yourself with cheap implements, then look out for cheap labour. Cut your men down to the lowest farthing they will work for; perhaps you may in that way make up for any loss sustained among the tools. Don't inquire whether a man is accustomed to ground work; everybody can dig, and trench, and use a mattock, or wheel a load of earth. Should some conceited acquaintance doubt the fact, settle it by a bet; match a tailor or a shopman with a rough labourer, and you will soon see who's the best. You may offer five to one upon the tailor; he can talk twice as well as a navvy; for his tongue is as smooth as his hands.

When you have mustered your men, if they are stout labourers, teach them how to do their work; if they are of the street class, leave them to themselves. A labourer will do his work as he has been accustomed to do it, and as is most convenient to himself; the others are ten times as clever, and will hit upon new ways of their own; in fact, they will perform the work as well almost as you could do it yourself. Of course the inspirations of genius are, in manual labour, worth all the practice and experience in the world. A clever printer will make stockings much better than a Nottingham weaver. If you will but interfere with men who are accustomed to garden labour, and leave to themselves those who are strangers to it, you will, in a few days, or even hours, find your operations as satisfactory as the most zealous bad manager could desire. Suppose, for instance, you have a square of ground to trench, an old experienced labourer will divide it into two parts, and wheel his first trench from the first half upon the corresponding end of the second half; in that way he saves wheeling, and expects to have earth enough with which to fill his last trench, when he reaches it at the end of the job. Can anything be more like good management, or common sense? But your object is bad management; and as for common sense, why, that is not required by a man of talent; therefore you should wheel your first trench to the other end of the ground, and work across the piece, instead of halving it, as the old labourer does. Should the land be soft, and you have cheap barrows, and the weather is wet, you will find this method a most surprising advantage. If to this you will add the scamping system, the nature of which, in trenching, any sharp country fellow can explain on the ground, better than any writer on paper, you may consider yourself perfect in this part of the art of bad management. Κήπουρος.

BRITISH SONG BIRDS.

No. II.—Presuming, as we have said, that all persons keeping birds are naturally and devotedly fond of them, and that they will ever make it their study to render them happy in a state of confinement, our early consideration will be how to build them a fitting Palace, and endow it with some of the sweets of freedom—a task not so difficult as might, by some, be imagined.

There are certain birds, to whom cages, when properly constructed, are more acceptable than the range of a large room; their natural habits being reserved, and solitude their delight. These I shall speak of at a more fitting season. However, the generality of birds prefer a commonwealth, and live in perfect amity when congregated—each individual being allowed, for the most part, to have his own way; though, by the bye, not always "his own way of having it;" a distinction, reader, pr'ythee mark, with some considerable difference attached to it.

There can be no possible objection, under certain circumstances, for granivorous and insectivorous (hard-billed and soft-billed) birds being associated together in the same aviary; but as this, for certain reasons presently to be given, can only be during the summer months, or from May to August, it will be necessary so to construct an aviary as to make it available for two distinct habitations—a summer residence, and a home for the winter. The one will then be assigned, during the inclement season, to the hardy or seed birds; whilst the other will be appropriated solely to the more tender, or soft-billed birds. These last, without having their dwelling kept at a temperature of equable warmth, would infallibly perish. This is worthy of particular attention, for many a valuable bird has been lost in a single night by a sudden change in the temperature.

A due regard must be paid to the proper regulation of the fire. Excessive heat is perhaps as fatal in its consequences as extreme cold; the lungs of these delicate creatures being sensitive to an extraordinary degree. Having little muscular strength in the winter, they are unable to fight against disease; and an attack of sudden sickness is beyond their power of mastery. When once a bird is "struck" in this way, nothing but a miracle can save him. If indeed he were to survive, he would never recover; and if he were valued only for his song, not another note would he be heard to utter! Soft-billed birds, the "warblers" especially, are difficult to rear through the winter. It requires many years' practice, and patience almost unheard of, to enable one to treat them successfully; and I much doubt whether, after all, they are, everything considered, worth the anxiety and trouble bestowed on them by amateurs. Regular "dealers" in these birds will have nothing to do with them in the winter. They are wise. Thus much however may be said—if you succeed in saving only two or three really fine birds, the recompense is great.

When I first stored my aviary, I placed in it an extraordinary number of small birds, including nearly every species, hard-billed as well as soft-billed. Being ignorant at the outset of the peculiar constitution of each, and their power to resist cold, I tried a rather hazardous experiment by allowing the more tender to hybernate, or try to do so, with the more robust; carefully noting how long they would exist in a state of health, without the aid of artificial warmth. It is only by these practical experiments that one can arrive at a perfect knowledge of facts. This experiment was a costly one, but it afforded me an excellent insight into what I much desired to know. I observed, not only that the tender birds drooped as the weather became gradually colder, but that their tempers and dispositions were visibly affected thereby, undergoing a remarkable change. They were sulky, fractious, quarrelsome, and tyrannical, by turns; and many of them, even in the agonies of death, left traces of their malevolence behind them. Nor did any of the survivors, after I removed them into warmer quarters, ever recover their original sprightliness and vivacity. Their plumage, too, was neglected; their voices were "wiry" and inharmonious; and their *pérsonnel* "shabby." They lost all the trimness belonging to their natural state, and seemed, to speak expressively, ashamed of themselves. When the spring came round, I felt it no more than due to my poor invalids (on whom, by the way, I had lavished my fondest care and attention during their stay in the "sick ward") to make them all the reparation in my power. I gave them their liberty. A flight across the waters of the Mediterranean in the ensuing autumn, and a six months' sojourn on the shores of Africa, would, I have little doubt, reinstate them fully in health; and it is more than probable, that the very same birds revisited my garden, and other their usual haunts before they originally took their leave, during the following spring.

Having thus accurately ascertained what might properly be termed "hardy," and what "tender" birds, I at once and for ever settled in my own mind the proper course of action in these matters. At the latter end of August, there must be a complete change of inmates; and the second or inner aviary must be got ready for the special accommodation of the "warblers." The room being warmed by a stove, can of course be kept at one regulated heat; and, with proper care and attention, very little loss of life may be anticipated through the winter. This, however, will mainly depend upon a strict attention being paid to proper diet, as I shall hereafter more particularly mention; for on migratory birds it is impossible to bestow too much care.*

The trouble these delicate little creatures occasion is immense. It is therefore but little more expensive, and no more difficult, to keep a large than it would be to keep a small number of them. Moreover, by so doing, you have a good chance of rearing some first-rate birds. If well tended, they will sing both through the winter and the spring; and if you choose so far to humour their fancy as to light up their *salon* at night, as I did, and use yourself to sit with them, they will amply repay you with a joyous, a "right merrie" song. Candle-light warblers are my especial fancy. I have had numbers of them; and such birds! Some amateurs would have walked a distance of 10 miles to have listened to them. But their race, alas! is run; the memory of them alone remains!

These little fellows throw all the powers of their soul into their "evening performances;" rarely venturing beyond a certain key-note, which may be justly characterised as harmonious. It is worthy of remark, that their vocal efforts never clash; on the contrary, every

* On the various phænomena attending the "agitation" of these birds, when in confinement, and which takes place twice a year—a most remarkable freak of Nature; I shall treat in its proper place.

chorister's voice blends with that of his brother musician, and produces the happiest effect—the accompaniments being at all times deliciously sweet. *William Kidd, New-road, Hammersmith.*

THE CULTURE OF THE VINE A HELPMATE TO THE CULTURE OF THE MIND; OR, TWO BIRDS KILLED WITH ONE STONE.*

[FOR COTTAGERS.]

CULTURE OF THE MIND.

No. I.—The preface, my friends, shall be short, and my introduction shorter; for my wishes will be fulfilled should I succeed in showing that the Vine is useful as well as ornamental, and the care bestowed on its culture equally beneficial to body and mind. Furthermore, I hope that after you have digested for yourselves my remarks, you will be able to discover the plan, object, and use of them.

The margin adds grace to the stream. The less said the soonest mended. A wink to the wise is better than a nudge to the foolish.

First, then, let us consider where the Vine naturally grows in its greatest perfection, and what conduces to that perfection of growth; and I think the question will be sufficiently answered for our purpose by broadly stating that the Vine flourishes best in a hot climate, and originally came from the East; also that it loves a mountainous district.

Art is a distillation of Nature, by which its spirit is concentrated above proof.

This will lead us at once to suppose that the sun plays the greatest part in the business. Well! as we cannot move England nearer the sun, we must try and make the most of its rays. How, then, do these act so beneficially on the Vine? In two different ways; first, on the part above the ground; secondly, on those through the medium of the earth below.

Abuse is the child of plenty, prudence of poverty.

How to increase the effect of the sun's rays on the branches.

Thus God's goodness fills the world with knowledge, which the reflecting mind of man gathers and applies.

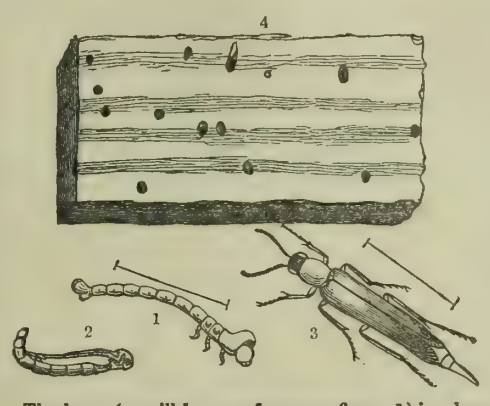
Now, as regards the heat of the sun on the branches, we find that whatever intercepts or stops it, receives or reflects the heat which would have been scattered over a wider space; moreover, we know that the Vine is a trailing plant, and requires support, therefore if trained against a wall, it obtains more heat and the necessary support.

A brick wall is considered the best on account of its porous, dry, and absorbent nature; a black colour will also yet more increase the heat; as it absorbs all the rays and reflects none. Since however cottages are not usually built for Vines, but Vines used to cover and ornament cottages; since also probably your cottage is already built; neither would you like to put your house into mourning; therefore we must needs bend to circumstances; however I only tell you what I think to be perfection, in order that you may get as near it as may be.

Kings most people would be; if they by wishing could be. Happy is the man whose circumstances are adapted to his wants, but thrice happy is he who adapts his wants to his circumstances.

ASPECT.—To resume (as authors say when they have been writing beside the mark), everybody understands that the position of the wall with respect to the compass; or in other words, its aspect, is important. From the foregoing observations, perhaps you will be inclined to think that the south must be the best aspect, but is nothing to be considered besides heat? I believe that wind and rain will be found to be very hurtful to Vines; therefore the most heat, together with the least exposure, is the best rule. The east is certainly the driest, and Vines in this situation get soonest rid of the night dews; and it is a good aspect. But generally speaking, the south-east most beneficially and to the greatest degree combines heat and dryness; and therefore this aspect may be considered the best for Vines. The further we go to the south and west, the more protection is needed from wind and rain; although a western wall if thoroughly well protected, will get the autumnal sun in its greatest power. East by north, round by the south to the western point, will include all the points of the compass, in which Grapes will ripen in this climate. *C. A.*

As man is made to look upwards, so ought his aim to be higher and higher still.



In making your pudding don't forget the plums, in boiling the water.

ENTOMOLOGY.

LYMEXYLON NAVALE.

In our volume for last year (p. 388) we described and figured two small animals, which commit serious depredations on the submarine wooden structures of Fir, Beech, and Oak in our dockyards, &c., one of which had previously been scarcely known as an English species. In a previous Number we also described another insect, Sirex gigas, which is occasionally equally injurious to Fir timber inland. In the former article mention was incidentally made of the Lymexylon navale, which had proved very injurious to Oak timber in the royal dockyards of Sweden. Of this last mentioned insect, although long reputed to be a native of this country, the only known British specimen was taken by Mr. H. Griesbach, in Windsor forest, in July, 1829. The capture of this specimen, which was a female, is recorded by Mr. J. F. Stephens in his "Illustrations" (Mandibulata, vol. v., p. 62), the insect being stated to have been taken out of an Oak. Mr. G. R. Waterhouse, however, who was present on the occasion, informs us that it was upon the bark, running with much activity, that the insect was caught, which does not militate against the possibility of the insect having flown from timber brought up the river Thames to Windsor. The last named gentleman has, however, further informed us that, on another occasion, whilst digging into the body of an old Oak tree in the same forest, he met with a larva which, from his description, we have no hesitation in regarding as that of Lymexylon navale, thus establishing its indigenous nature.

About the middle of the month of June last we received from a correspondent, "T. S. P.," at Pembroke dock-yard, some larvæ which we immediately recognised as those of this species, which at that time were "destroying (to use the words of our corresqondent) the Italian Oak thick stuff, (the technical name for planks about 4 inches thick in store at that port.) They were not seen when the wood arrived and was tested, but their ravages are becoming serious." They were found busy in wood delivered in 1846, which led our correspondent to suppose with justice that they had been bred here.

The larva (as will be seen from our figure 1) is a long, very thin, cylindrical, white, fleshy grub, like a worm with a corneous head, the first segment of the body produced into a sort of hood over the head, three pairs of short jointed legs, and the terminal segment of the body swollen. They measure, when full grown, about three quarters of an inch in length, and are then transformed into a pupa (fig. 2), with a long body, and the wing cases and legs lying at rest upon the breast, our figure representing the animal lying on its back. The perfect insects are developed about the middle of July, our correspondent having informed us that at that period they were appearing by thousands in the Pembroke dockyard. They have been long known for their destructive habits on ship timber, and hence the specific name given to them of navale, by Linnæus, who was employed by the King of Sweden to investigate their habits on the occasion of their appearing in great numbers and committing much damage in the royal dockyards of Sweden.

They belong to the order Coleoptera, but the family into which they enter is doubtful. In the introduction to the modern classification of insects they are formed with the genus Hylecætus into a separate family Lymexylonidæ. They vary in length from one-sixth to rather more than half an inch in length; the male is black, with the inner base of the elytra, legs, and abdomen dirty orange coloured; the female is larger and brighter coloured, with the thorax reddish, the head, margin, and apex of the elytra and wings dusky black, the antennæ brownish black, and the legs pale fulvous.

As the period when the insect arrives at the perfect state is well known, we are able to apply effective measures for the protection of timber from its attacks, or the destruction of the insects when they have already attacked the wood. Linnæus suggested that the timber should be submerged at the time of the appearance of the perfect insects, which would of course drown those just disclosed from the pupa, and which would be weak and easily killed, in case the timber contained any such—whilst it would also prevent the insect, if developed elsewhere, from depositing its eggs in the submerged timber.

Our correspondent at Pembroke informs us that the wood infested with the insects has been put into the steam-kilns there, which has been attended with the best effects. These steam-kilns are long boxes made steam tight, into which the wood is placed, and then shut in with double doors, and wedged tight. The steam is generated in boilers, and conveyed into the trunks by pipes, the wood remaining in about 8 or 10 hours, to be thoroughly soaked, and not less than eight, after the steam is well up and the trunk ready. Italian and English Oaks, 10 inches thick, require the above time; Mahogany and Teak not so long. About 10 hours was found sufficient for the destruction of the larvæ of the Lymexylon. The wood is steamed for the purpose of making it bend round the bows and stems of the ships building, as it becomes pliable by the process when put on directly after it comes out. If left without being then used, it requires to be steamed again. This plan for the destruction of the insect is evidently preferable to that suggested by Linnæus, although it of course does not prevent the Lymexylon, if developed elsewhere, from depositing its eggs in the timber after it has become cold. *J. O. W.*

VILLA AND SUBURBAN GARDENING.

THE importance of keeping up a succession of bloom during winter and spring, is felt by every amateur whose garden possesses a greenhouse; and to point out such plants as are of easy culture, and, at the same time, acceptable to a light purse, has been my object in many of these papers. Epacrises now consist of numerous varieties, of great diversity of colour and habit, and they are all procurable at a small cost; in fact, 20*s.* will purchase a tolerably good collection. They form, when out of bloom, interesting evergreen bushes. The foliage is singularly beautiful and diversified. The constitution of the plant is hardy, resisting, without injury, several degrees of frost.

A great point in the management of the Epacris, so as to get a good bloom, is never to stop the young shoots when in a growing state; because it is chiefly upon these that the flowers are produced. E. miniata, for example, should be cut back after it has done blooming in summer; and when it begins to grow it should be repotted, and the ball slightly reduced. When the operation of potting is over, place it in a close frame, or pit, until it is again in a growing state; admit air by degrees, and when fully hardened to enable it to sustain exposure, place it in a shady position, such as the north side of a hedge. Supply it with water, and occasionally, a little liquid manure, so that the growth may be promoted with all possible rapidity. Towards autumn, expose it to the full sun, in order that its wood may be perfectly ripened, and the bloom-buds set. It should then, as winter approaches, be housed in a greenhouse; and if permitted to flower in that situation, few plants will present a more lovely aspect. The beauty of this variety of Epacris will greatly depend upon the absence of stakes. Allow it to follow its natural growth; to twist it into a wire hurdle is to destroy its beauty completely. All the varieties of Epacris require little support, if properly managed, and the fewer stakes seen in the plant, the better.

All the varieties of Epacris may be grown in good peat, with a little silver sand intermixed with it. In potting, take care that the pots are effectually drained. The potting season is when the plants have done flowering, when the size of the plant should be reduced, as circumstances may suggest. *Pharo.*

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

In the NATURAL HISTORY SECTION, Dr. HUGH CLEGHORN made a communication *On the Grass-cloth (Chu Ina) of India.* He stated that several species of plants belonging to the order Urticaceæ were employed in Hindostan for the purpose of yielding fibres used in the manufacture of textile fabrics. He exhibited several articles of dress very white and light, which were made from the fibres of an Urticaceous plant, the Bohmeria nivea, and known in India as Grass-cloth.—Dr. D. Maclagan inquired if the fibres of this plant had been examined microscopically, as he had found that on being used for rubbing the glasses of optical instruments it scratched them. Should it become generally used in this country, care must be taken to avoid its application to delicate objects.—Mr. Gourlie, of Glasgow, stated that we knew very little of the raw material of many of the fabrics from other parts of the world. We were for a long time ignorant of the materials from which Manilla handkerchiefs were made. It was said to be the fibres of the leaf of the Pine-apple, but we had not succeeded in manufacturing them in this country.—Dr. Lankester remarked on the importance of an increase of our knowledge of those forms of plants which were capable of yielding materials for manufacture. Although the exhibition of raw materials had been deprecated by some in the coming Exhibition of 1851, he believed that it might be made one of the most important and valuable features of the Exhibition.—Dr. Royle said that it had been long doubtful what plant yielded the grass-cloth of India, and now that we knew the plant, it would undoubtedly lead to its further employment. There were many other fabrics in India of which we knew nothing of the materials. He thought that one of the most important branches of the Exhibition of 1851, for the manufacturers of this country, was that of raw materials. Every pains should be taken to obtain the name and history of every species of plant which yielded any substance useful in the arts, manufactures, or medicine.

On an Acarus and a Vibrio that attack Grasses; by JAMES HARDY, Esq.—Our indigenous Grasses frequently become diseased by the attacks of small animals, and the author described some forms that had not hitherto been discovered. In the beginning of July his attention was directed to Holcus lanatus (Meadow Soft Grass), in which many of the panicles were blighted. The causes of this were two. In the one case the base of the shoot was either dissevered from the stem or was becoming pubescent where in contiguity with it, and occasionally channels were eroded in the inveloping integuments, which were sometimes strewed with hard

* At the request of the author we reprint a portion of this communication which appeared at p. 645, he not having intended it for publication in its then state.

granules, apparently excrementitious. These were produced by an active yellow maggot, which the author suspected belonged to a Chlorops. In the second set of examples the panicles were quite soft and debilitated, and the branchlets were matted together by some action that had entirely exhausted them. On a close inspection several small, white, spherical, glassy bodies were perceived sticking amongst the florets, and closely invested by them. On extracting one of these it was found to be a soft turgid animal, evidently an Acarus, but differing from most species of this genus in being to outward appearance destitute of legs. This creature is about half a line in length. The author then proceeded to give a detailed account of its structure. Although in the latter stages of its growth no legs are perceptible, the author had abundant opportunities of observing the young immediately after being hatched, when they were found to possess six very serviceable legs. The Acari are most abundant near the summit of the panicle, but they sometimes occupy the base only The stem of the Grass seems the principal object of their attack, and the drooping of the panicle the result of the arrest of the ascending sap, which they use for their own nourishment. The author had observed this creature on Holcus mollis, also on Aira cæspitosa. He proposed to call the species Acarus graminisugus. The author had also observed a new Vibrio. This was observed on the sheep's Fescue Grass (Festuca ovina), and some other Grasses of the sea coast. They are affected with several purple knots or swellings, which, on being opened, appear as if filled with bluish or purplish granules, but on closer examination a little white annelide was observed coiled up in channels winding amongst the granules. These were the Vibriones. Some of the knots contained only one, others half a dozen of these creatures. They are white, almost transparent, very minute, just visible to the eye, slender, pointed at each end. This Vibrio differs from the one described by M. Bauer, and which produces the ear-cockles or bunt in Wheat. The author, therefore, proposes to call the species Vibrio graminis. It is by no means unfrequent amongst the short Grasses on the sea coast, and occurs likewise inland on arid pastures.

Dr. Lankester read the report of the committee appointed to draw up Tables for the Registration of the Periodical Phenomena of Plants and Animals. The report stated that only two of the many tables issued had been returned, one from James Hendy, Esq., of Penmansheil, by Cockburnspath, the other from Matthew Moggridge, Esq., of Swansea. The committee urged upon all who had received their tables, and who had made only a few observations, to return them, as even a few accurate observations, when collated with others, would be of importance. Several correspondents of the *Gardeners' Chronicle* were supplied with registration papers, but none of these have been yet returned.

Home Correspondence.

Select Plums.—The Reine Claude de Bavay, mentioned in your report of Mr. Rivers's nursery, is a very desirable Plum, but certainly not equal to the Green-gage in flavour. I lately had an opportunity of examining specimens of this Plum which had been grown in France. These were more oval-shaped than the Green-gage, and the colour was a dark yellowish green. The flesh was not very juicy, and wanted that briskness which makes the Green-gage so much liked; this, however, might in some degree be ascribed to the long journey and bad packing. Its season appears to be the beginning of October, as the fruit I saw arrived in England about the 10th. Two other Plums new to me have also come under my observation this season. These are chiefly valuable for their size, which is enormous, each of them being larger than the white Magnum Bonum, and similar in shape, but of a dark purple colour. One is supposed to be the "Queen Mother;" the other is a seedling, said, although no doubt mistakenly, to have been raised from an Apricot stone. I strongly recommend to Plum growers the variety called "Kirke's" in the Horticultural Society's Fruit Catalogue, which is the best purple Plum I am acquainted with. It is of good size, very handsome, and of excellent flavour. The Royal Hative is also a capital sort; so likewise is the Reine Claude Violette. These three, with the Precoce de Tours for earliness, and the Ickworth Imperatrice for lateness, are all the purple dessert Plums that any one need cultivate. Of light-coloured Plums, the Washington, Jefferson, Green-gage, Reine Claude de Bavay, and Golden Drop are the best; and the above 10 sorts will be found amply sufficient for the supply of any gentleman's family. For culinary purposes, the Early Orleans, Goliath, Denyer's Victoria, and white Magnum Bonum may be recommended. The last named makes an admirable preserve—equal to Apricot. There are better Plums than Denyer's Victoria, but I include it on account of the hardiness of its blossoms, which withstand cold better than those of most other kinds. For preserves and tarts late in the season, the Shropshire Damson and the Winesour should be grown. *J. B. W.*

Frozen Land.—Mr. Glenny, in his "Hand-Book to the Flower-garden," &c., in his Calendar for January (first page, and bottom of first column), recommends burying frozen earth, and covering it with the subsoil. Is not this horticultural heresy? Will it not preserve this buried ice, and thus make the under-soil chill for most of the year? Such has been the result of a trial of this plan in the midst of a plot of Carrots. A farmer in this neighbourhood once ploughed in an inch depth of snow. The land was wet in spring, when the contiguous fields were dry, and the crop was principally of strong growing weeds. The Barley would not grow. *Enquirer.* [Frozen materials should not be buried. Earth should not be dug or ploughed till it is thawed.]

Lawns and Cockchaffer Grubs.—At page 652 a bitter complaint is made respecting the ravages of the larva of Melolontha vulgaris, or cockchaffer grub, and the writer concludes by expressing an anxiety to know whether any practicable preventive of their depredations has lately been discovered. As my lawns have suffered greatly during the last two autumns from the same cause, and more particularly during the present one, I have been consulting authorities on the subject; but I have been obliged to come to the same opinion with Loudon, expressed many years ago, that the grubs must be left to the crows and rooks, and the perfect insect be gathered by hand. The larvæ are so tenacious of life that they seem to be little affected by the application of decoctions of green Walnut shells, lime water, or even corrosive sublimate. Tobacco water will kill them, and so will salt and water; but the latter, if sufficiently strong to destroy the insect life, will destroy vegetation also, and the former is too costly a remedy. A little work on the "ver blanc," or cockchaffer grub, and its ravages, was published in Paris by M. Vibert more than 20 years ago, and sent to Loudon by Mr. Calvert, of the Trianon Nursery. This pamphlet gave rise to long notices on the subject from Calvert, Swainson, Main, and Loudon himself, in the "Gardeners' Magazine" for 1828, all very interesting, but all arriving at the same conclusion, that the destruction of the larvæ to any great extent was all but impossible. M. Soulange Bodin, a French gentleman, offered 400 francs as a reward to any person who could find the means of destroying the larvæ. In my case, birds of all kinds by day, and hedgehogs by night, have very sensibly thinned their hosts, but much of the turf is left in a state almost beyond recovery. *W. T., Coventry.*

French and English Vegetable Markets.—Having just been in Paris, I was surprised to observe that green Peas were plentiful, and immensely large Cauliflowers abundant. Upon passing through Covent-garden, I saw no green Peas, and comparatively poor Cauliflowers. Now, to what is this owing? The drought and summer heats of Paris, so far from being favourable to green Peas, are decidedly adverse; at least, I find that even in England summer sown Peas in my sandy soil perish from mildew. *G. S., Bromley.*

Oncidium flexuosum.—I have a fine flower-spike of this Oncid bearing 168 blossoms. On one of the branches are two flowers, with two lips (on one the second lip is reversed), and the sepals, petals, and the other parts of the flowers doubled; I have never observed this before—is it an uncommon occurrence? *T. D. H.*

New Grape.—I have sent, for your opinion, a bunch of my seedling Grape, off the same Vine as the bunch I sent last year (see p. 602, 1849). It is a Black Hamburgh, crossed with the Muscat of Alexandria. I thought you would like to see it again, as I think it is rather better coloured than it was last year; it was grown in a Vinery without the least fire-heat whatever. Do you think the Black Muscat would be a proper name for it? [There is one already so called.] I have sent a few large berries from another bunch, that you may see how large it grows [3¼ inches in circumference]. I have also sent three of the leaves, in order that you may ascertain their shape and size. *J. E. L.* [Bunch long, tapering, and shouldered. Berries large, oval, nearly round when well grown; some quite as black as well coloured Hamburghs, others somewhat grizzly on the same bunch, but all possessing a rich Muscat flavour. Leaves very large, a foot or more across, deeply 3-lobed, nearly smooth above, pubescent beneath; ribs and leaf-stalk rough. A variety highly deserving of cultivation. Much the best novelty that we have seen for a long time. It is capital.]

Miss Cooper's "Rural Hours."—I do not remember to have seen in the *Chronicle* any notice of a work which, I think, would suit the taste of many, if not all your readers; I mean "Rural Hours," by Miss Cooper, the daughter of Mr. F. Cooper, the American novelist. It is in the form of a diary of the year 1848, something in the manner of the diary of a naturalist, recording day by day, in a most pleasing, unaffected style, the changes of the seasons, the arrival, habits, &c., of the birds, the growth and blossoming of the trees and flowers, and, in short, noting with an observant eye every thing relating to the natural history of the part of America in which the authoress resides. To her American readers this locality is doubtless well known; but to those in England it would add greatly to the interest of the book to have had a few more particulars of the situation, which we are led to infer is somewhere south of Lake Seneca, in the State of New York. Miss Cooper has occasionally introduced other subjects, which she has treated in a manner which proves her to be a lady of an enlarged and highly cultivated mind and well read in English and foreign literature. Although, evidently a good patriot, and much attached to her own country, she can yet perceive faults, and point them out in such a manner as one would hope might tend to convince the Americans that they are not quite perfect. If Miss Cooper would go on and give us a more complete insight into the manners and customs of American life, I feel convinced she would produce a work which would be much appreciated in England. I must, however, make one remark on a point on which much may be said on both sides. Miss Cooper complains of the harsh and unpoetical names given to plants; but she forgets that the botanical names at once enable her English readers to know to what plants she refers, whereas Partridgeberry, and sundry other American local names which she gives, convey no idea of what the plant is of which she is speaking. She seems herself to admit this, by giving a few of the botanical names in the latter part of the work. The same may be said in respect to the names of the birds. If these few remarks lead to your perusal of this work and your recommendation of it, I am sure all lovers of natural history will feel obliged to you. *A. M.* [As to the fair authoress's comments upon nomenclature, we cannot say that they indicate much acquaintance with the subject to which they refer.]

Cure for the "Onion Grub."—It may interest some of your readers to know that an application of nitrate of soda will kill this pest. I used it in the proportion of ½ lb. to 1 gallon of water, and applied 8 gallons to a bed of 10 yards in length. It stayed the progress of the disease, and the crop was healthy and good in every respect. *A. Williams, Camphill, Ripon.*

Oxalis crenata.—In the *Gardeners' Chronicle*, of April 14, 1849, there appeared a brief notice of a paper read, on the 11th of the same month, before the Society of Arts, and furnished by Baron Suarée, who therein gave the results of his experiments in the culture of the Oxalis crenata. Travelling lately through Belgium I received from M. de Bellemain, a fellow traveller, some details which fully corroborate the statements of Baron Suarée as to the acreable produce, &c., of this vegetable. Commissioners were appointed last year, by the National Assembly, to report upon the communication of M. de Bellemain relative to its culture and uses, and they reported to the following effect:—The Oxalis had been cultivated in Brittany during many years, by M. de Bellemain, on light soil, treated as to manure and tilth as for Potatoes, and the produce has been (the same as that obtained by Baron Suarée) 200 hectolitres per hectare, or 4 tons to the English acre—no very formidable rival to the Potato in respect of weight, being, in the commissioners' judgment, two-thirds of the produce of the same extent of land under Potatoes. The quantity of flour (*fécale*) yielded by the Oxalis was in a still lesser ratio to that afforded by the Potato (the investigation, however, was incompletely conducted); but, on the other hand, the nonfeculent portion of the Oxalis appeared to be less fibrous, and, therefore, more digestible as food than the corresponding portion of the Potato. The reporters pronounce then that what the Potato gains in amount of flour or starch, is counterbalanced in the Oxalis by its superior nutritiousness; in what degree can only be justly estimated by a long series of experiments. Some bread cakes were made of wheaten flour, and the tubers of the Oxalis steamed, with the skins unpeeled, and mixed in the ratio of seven parts to nine; and this bread—without entering into an exact analysis—proved to be whiter and lighter than that of first quality Paris bread. The Oxalis crenata, like the Potato, is suited to many culinary purposes.—If the report stopped here, we should not be disposed to let the Oxalis crenata enter into the lists with the Potato (supposing that the latter shall be one day re-established in health); but we are assured that the haulms of the former, unlike those of the latter (which are positively noxious), are not only innocuous, but capable of yielding a very palatable and wholesome beverage. Moreover, the stalks are so abundant and succulent that they have yielded 400 hectolitres of fermented beverage, resembling the *squaw* manufactured in Russia, without diminishing the produce of the tubers. This certainly staggers me not a little, as it is opposed to the received principles of vegetable physiology. But let the report be heard to its conclusion. This beverage would be highly precious in those localities where the water is bad, and where the people cannot afford a better sort of drink. The expense of manufacturing the beverage, of which M. Bellemain produced some two years old, is merely that of the time and labour occupied in expressing the juice from the herbaceous stems. The commissioners conclude that M. Bellemain has performed infinite service to his country, by bringing the edible portion of the Oxalis to perfection, and giving it a right to rank with the Potato, or else immediately next to it as an esculent, and in developing its new properties, as a material for the easy manufacturing of an agreeable and wholesome drink. Such is a condensed statement of the commissioners' report, which states that M. de B. has published a pamphlet on the culture and uses of the vegetable in question. The tubers should be planted in April; the smallest answer perfectly well for seed; they should be 3 feet apart or more in every direction, to allow full growth to the stems and foliage. *M. D.*

Browallia Jamesonii.—I, like many of your correspondents, must complain of the great difficulty that exists in inducing this plant to flower. *T. D. H.*

The Purple Elm.—Amongst the beautiful trees lately introduced, which are calculated to improve the park-like scenery of the country, so pleasing to all except the farmer, who has to cultivate the timber-incumbered fields, I know none which will produce a more striking effect than the purple Elm. Though a tree of easy propagation and quick growth, it is but little known at present, though it is now three or four years since it was brought to this country. It is so

decided a purple variety, that the young shoots are deeply stained with the colouring matter of the leaves. The Ulmus viminalis, now an old variety, is too much neglected. On account of its slender shoots and small leaves, people are apt to imagine that it is small and insignificant, whilst, in truth, it is apparently a tree of medium size, if not of the proportions of the rest of the family. Nothing can be more beautiful than a large tree of this Elm, as it continues of the same dense habit as when young, the foliage seldom being larger than the finger nail. *J. R. Pearson, Nottingham.*

Fruit Queries.—Will any of your readers be kind enough to give me advice on the following subjects. I have two Cherry trees, the "Black Eagle," and the "Bigarreau," which blossom and show fruit, but, at a very early stage, it becomes yellow, and drops off. The trees are very healthy and in good old garden ground, one against an east, the other a west wall. I have also Vines in a greenhouse very healthy, with very fine wood and leaves, which produce a few and very bad bunches of Grapes. The soil was made for them about 10 years ago, and there is a gravel walk over it. There is a workhouse union in my parish, which has many fine extensive walls of every aspect, but they are useless, because the inmates steal the fruit. Can you suggest anything to be planted against them, which would not be enticing to them? *P.*

Epps' Sulphurator.—I am surprised to find in the *Gardeners' Chronicle* of last week, that Mr. Fry complains of my taking advantage of his ideas and invention for diffusing sulphur, the construction of his machine for this purpose being so entirely different from that of mine. In the latter part of August last I wrote to Mr. Fry for one of his machines, for the purpose of diffusing sulphur upon the Hop plants in this neighbourhood, which were seriously attacked with the mildew, and I regret to say that I found it of little or no use, as I could scarcely throw the sulphur 6 inches from the mouth of the machine, and this in a very irregular and clotted manner. This machine is almost a fac-simile of "Brown's Fumigator," the sulphur-box, with perforated holes at the bottom, being placed directly over the casing of the fan-blower. The sulphur is forced through these holes by means of a revolving wire inside the box worked by the wheels which drive the fan-blower, and immediately falls upon the fans, the sulphur revolving with them, and eventually falling to the bottom of the fan case, from which it is blown in a very imperfect and clotted manner, with but little force. Seeing this difficulty, and being anxious to relieve the Hop and Grape growers of this district from the serious destruction occasioned by the mildew, with the assistance of a friend of mine, a practical engineer, I constructed the one described in your leading article of the 12th inst., which effectually diffuses the sulphur in an even state into the air passage before the blast, produced by a powerful fan-blower, constructed on approved principles, and throwing a continual cloud several feet from the mouth of the machine with great force, so that it enters the most minute parts of the plant, where the disease is frequently seated. This apparatus will enable the horticulturists, as well as the agriculturists, with little expense, to remedy any attack of the mildew upon their crops, however extensive. I claim the exclusive right of this invention for England and France; it will shortly be before the public, and I shall have much pleasure in leaving it in their hands to judge of its merits; and if any other contrivance can be employed that will more effectually accomplish the desired end, I shall with the public duly appreciate it. I beg to assure Mr. Fry that I have had no intention whatever to copy or make use of his ideas or invention, and I think I have clearly shown, that my apparatus is most essentially different from his. *W. J. Epps, Bower Nursery, Maidstone.*

Societies.

Botanical, of London, *Oct.* 11.—A. Henfrey, Esq., V.P., in the Chair. Several donations were announced, and two new corresponding members elected. Mr. D. Oliver, jun., exhibited specimens of Naias flexilis, of Rostkof, discovered in a pond near Roundstone, Connemara, Ireland, in August last. Mr. D. Stock communicated a paper "On the Botany of Bungay, Suffolk."

Garden Memoranda.

Mr. Rivers' Nursery, Sawbridgeworth, Herts.—In mentioning some autumnal Roses remarkable for their tendency to flower freely, it will be best to give the names of those only that are this day (Oct. 22), in full bloom; for owing to the long period of dry weather, only those that are really and truly "perpetual Roses," are now flowering. In this category the Bourbon Roses, with some few exceptions, have the palm, for they are still covered with blossoms and blossom buds. The most conspicuous among them are the following. Du Petit Thouars: this Rose, brilliant in colour as the Gloire de Rosaméne, with large and very double flowers, has never ceased to give abundance of blossoms from June to this day, and many young dwarf standards have still from 12 to 20 flowers and flower buds in every stage of development. Comice de Seine et Marne, a pretty cherry-coloured Rose, is also in great beauty. Edouard Desfosses, a rose-coloured variety, and Emile Courtier, are also in perfection. George Cuvier and Henri Lecoq, two very fine carmine Roses, and Justine, of the same group, as regards colour, with large beautifully-shaped flowers, are all like Rose bushes in June and July, rather than in October, so numerous and brilliant is their appearance. Le Grenadier and Raymond, two splendid crimson Roses, and Menoux, of a deep carmine, are as prolific in flowers as any of the colour; and Madame, Augustine, or Therese Margat—the three are one—a very beautiful rose-coloured Bourbon, is most conspicuous in a large bed; for every tree—they are dwarf standards—is a bouquet of flowers. Among the Bourbon Roses, with light-coloured blossoms, none approach Souvenir de la Malmaison, still studded with its large and magnificent flowers; Madame Angelina, although not a very vigorous grower, is still finely in bloom, and the Queen of the Bourbons is literally covered with flowers and buds. The above are not pointed out as novelties, for they are all Bourbon Roses of some years' standing, and they are all, what is so eligible in gardening, cheap and good.

The Hybrid Perpetual Roses have suffered much by this droughty season; generally they rival the Bourbons, but at this moment there are but few in full beauty. In this select few is Géant des Batailles, still giving abundance of its brilliant glowing flowers, and Duc d'Alençon also finely in bloom. Baronne Prévost, with its very large rose-coloured, and Jacques Lafitte, with large and very double flowers, of a deeper rosy tint, are both in full beauty; the former always blooms in perfection, the latter only in dry seasons. Cymedor, a charming brilliant crimson Rose, is now in a good state; this variety is only beautiful in autumn, for in summer it seems to shrink from the bright glare of the sun. In most seasons there are many other Roses of this family in high condition at this season, but not so now; we have therefore thought it better to confine ourselves to those remarkable for having withstood this untoward autumn. The China Rose, Mrs. Bosanquet, is most remarkable for its abundant autumnal blooming, and is now covered with its pale, flesh-coloured, wax-like flowers.

Miscellaneous.

Cultivation of Potatoes.—Having for many years in succession successfully grown Potatoes for private use, I send an account of my mode of procedure, thinking that the same principles which guided me in their cultivation in the garden may be applicable to their more extended cultivation in the field. The system will probably be best understood by treating it in the following order, viz.:—1st. The seed Potatoes; their selection, keeping, and preparing for planting. 2d. The manure; its preparation. 3d. The kind of ground selected, and its preparation for planting. 4th. The planting and after treatment. First.—The seed Potatoes were invariably selected at the digging of the crop. Such only were then picked out as were true to their kind, of a fair average size, quite sound, and well matured. These were dried in the sun stored in small casks, and covered with dry ashes, and the casks were kept in a cool and dry place throughout the winter. In this way they are equally well secured against the severest frosts, and from the generation of heat by stowing away too large quantities together in a damp state. Towards the latter end of February, before the temperature of the season was sufficiently raised to produce a natural growth, the seed Potatoes were cut into pieces, each set containing two eyes, and the cut parts of these sets were then thoroughly dried by exposure to a draught of mild air for about a fortnight, repeatedly turning them over during this period. When this was well done, the sets rarely failed in sending up one or two shoots. One shoot is probably better than two; but two eyes were always left in each set, from an apprehension that if it had one only, that one might occasionally fail. Second.—The manure for the Potatoes, and for the general crops of the garden, was a compost, of which a large heap was made every year. A deep pit was dug, into which was put all the refuse vegetable matters of the garden. This pit was emptied once a year, and its vegetable earth formed the basis of the intended pile. If this earth was considered insufficient to absorb all the liquid matter of the manure to be laid on it, more earth of some kind was added to make the lowest stratum sufficient for the purpose. From time to time, quantities of fresh stable manure were spread regularly over the vegetable earth, and if these were not wet enough, they were made so by watering, in order to insure a regular fermentation of the whole. As soon as a sufficient quantity of fermented manure was accumulated, the contents of one or two middens were laid uniformly over it. Then a layer of well-burnt lime, fresh from the kiln, was added, in the proportion of one load to four or five of all other matters. And the final covering was a good coating of sea sand. When the lime was all slacked, which it would be in about a fortnight, the whole heap was turned and well mixed during the operation. In a month or two after the pile was again turned and mixed. This was the compost. Some salt was occasionally added to it. It was sweet, free from insects and grubs, and an excellent manure for all the crops of the garden. No wireworms were ever seen in the ground after its use, although these generally occurred after the application to it of new stable and other undecomposed manures. Third.—The ground preferred for the Potato crop was that which contained most vegetable earth, and which was naturally drained, friable, and exposed to the sun. The appropriation of it for this purpose was always made in October. Whenever the weather proved to be dry in this month (all the operations were performed in dry weather), the compost was wheeled on the ground, spread regularly thereon, turned in, and carefully mixed with the soil in turning. If the ground proved to be in the least stiff, there was put on it an extra quantity of sea sand, which was turned in with the manure. In the first favourable time in the succeeding month of November or December, the ground was ridged for the winter. In the ensuing February or March, the ridges were levelled, and the ground turned preparatory to planting. Fourth.—The Potato sets were always planted, if practicable, before they had naturally vegetated, and in order to effect this, early planting became indispensable. This work was generally performed in February and March. The cuttings were put into clean furrows, without manure, at a depth of 3 inches, and at a distance from each other in the rows, varying from 12 to 15 inches, according to the size of kind planted. The rows were made from 2 to 3 feet apart, varying them also—but within these limits—according to the size of the variety put in. As to the after treatment, as soon as the shoots began to make their appearance, the first dry day was seized to turn the ground lightly between the rows, in order to destroy the first crop of weeds. Subsequently, but during the early progress of the Potato shoots, the ground was twice lightly turned between the rows, and about 1 inch of earth was, at each turning, landed up against the stalks. The crop was then suffered to come to maturity. It never failed to turn out well in weight and quality. The first object of this system was to obtain as perfect seed Potatoes as possible for planting, from a conviction that these were essential to the production of good and sound crops, which, it was thought, were not regularly attainable by planting Chats, frosted Potatoes, and such as have been exhausted by premature growth. The Potato, doubtless, like all other bodies that have life, possesses a certain period of vitality; as this period approaches to a close in any variety continually propagated by the root, it becomes gradually a shy bearer, and then manifests other infirmities of age before it disappears; and as it has been unduly pampered with stimulating food throughout its career, it acquires in time, especially as age advances, the diseases incident to such a course of life. It would appear from these circumstances, that a great additional improvement in the cultivation of Potatoes for food, would, in all probability, arise, from the entire abandonment, as soon as practicable, of the use of the old varieties for sets, and the gradual substitution, until it becomes universal, of sets from new varieties, raised by careful cultivators, from the seed of the ripe berry. Another object of the system was to renew the strength of the ground by thoroughly mixing with it a well-prepared compost, instead of following the common practice of laying in the furrows, at planting, new stable manure, which, besides producing wireworms, unduly stimulates the growth of the haulm at the expense of the root. It was also conjectured that the application of undecomposed manures to the sets, brings diseases on their products; and some occurrences tended to strengthen, if not confirm, this conjecture. The Potato, as most cultivators of it must have observed, grows well in old pasture ground filled with small roots, in the land of old Furze crofts filled with decayed thorns, and in other equally light vegetable soils, through which its delicate tubers may readily penetrate, expand, and find appropriate nourishment. Hence the object sought in the extended preparation of the soil, and in the peculiar mode of manuring it; namely, to bring it into a condition as well adapted as possible to the observed requirements of the plant. Potatoes will also burrow up towards the surface, where they are not impeded from increasing in number and size by the weight of the earth above them, and where they can obtain the genial heat of the sun in perfecting their farinaceous matter. Hence the object of shallow planting, and hence also the motive for not landing up, in the ordinary way, much earth against the haulm. The object for planting cuttings was, by limiting the number of shoots from each set, to admit the sun and air freely to every plant, and to the surface of the ground, and the placing of the rows wide apart had the same object in view. There was another motive for planting cuttings; namely, to obtain a moderate number of fair-sized Potatoes from each set, instead of a numerous progeny of small ones—the ordinary result of putting in whole Potatoes. The common practice is injurious in another point of view; the whole Potato sends off a numerous offspring of shoots, which after wet, succeeded by heat, and further stimulated by new manure, covers the entire surface of the ground, intercepts the genial influence of the sun, checks the circulation of air below the stems, and produces a vigorous top growth at the expense of the root. If, it may now be confidently added, frosty nights in August, such as have occurred for several years past, should find the Potato plants in this state of exuberant growth, the consequences are not difficult to foretell—the destruction of the haulm, the non-production of farina in the immature root, and thence the inevitable tendency to early decay. *A Subscriber, Manchester, in the Economist of Oct.* 19.

Duty on Potato Flour.—An importation having taken place from abroad of farina, or Potato flour, the importer requested that it might be regarded in the same manner as wheaten flour, and delivered at the duty of 4½*d.* per cwt.; but as the article appears to be not only serviceable for food, but also as an important material in a manufacturing process, it was decided to be liable to the *ad valorem* duty of 10 per cent. as a manufactured article, and ordered to be charged accordingly. *Economist, Oct.* 19.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

TAKE advantage of the present season, when potting and similar operations are almost suspended, to wash carefully all plants which are or have recently been infested with insects, with soft soap dissolved in warm water, as the gummy matter by which the eggs of many of these pests are attached to the branches is thereby loosened, and they are more easily removed. The latter part of the business should be managed by syringing the plants with water at a temperature of about 120° or 130°, which will also destroy any living insects which may be lurking about them. Much more good is done by carefully cleaning plants in this way, at this season, than many are aware of. Let any necessary pruning, especially amongst creepers, be done before the cleaning commences, as it is injudicious to waste time in cleaning shoots which are afterwards to be cut away. Have all dirty pots washed and their surface soil loosened, and examine carefully any of which the surface has a green or sodden appearance, which is an evident sign that water has been too liberally used, or that the drainage is inefficient; if the latter, it should be immediately examined and rectified, as considerable damage is soon done at this season, when the soil gets in an unhealthy state. Many of the greenhouse Geraniums, and other plants of similar texture, which are in the course of preparation for next spring and summer, will require repotting. In this do not allow the time of year to be any impediment, as nothing in the successful cultivation of such plants is more indispensable during their period of growth than shifting them into larger pots before their roots become too much matted. Greater care in watering is necessary after repotting at this season. In the Heathery, the plants must be carefully watched and dusted with sulphur upon the first appearance of mildew. Keep these plants as hardy as possible by a free circulation of air, and by removing the lights every fine mild day. The stock of plants usually denominated "forcing"-or winter-flowering plants should be carefully examined, and compared with the estimated wants during the next five months, that any deficiency may be supplied in the most eligible manner. Lifting and potting of hardy shrubs, as Rhododendrons, Lilacs, &c., may still be done; but it is advisable not to use these too early, as their blossoms are finer and more lasting when they are not forced until very nearly their natural period of blooming. Amongst the plants which it is not yet too late to procure a stock of, we may particularly mention Tea-scented, China, Moss, and Provins Roses; Belgian and other Azaleas, with Anna Boleyne Pinks, Perpetual Carnations, tree and Neapolitan Violets in pots, Lily of the Valley, &c. These must be brought forward in successional lots by placing them in situations somewhat warmer than those in which the main store is preserved. The most congenial of all forcing pits is a bed of leaves, the heat in which is maintained by means of a hot-water pipe passing beneath them. By plunging the plants in such a medium their roots are kept in advance of the tops, and plenty of air can be given, thus preventing the lanky etiolated appearance so commonly seen in forced plants. While upon the subject of plants for forcing, we may mention a few, which, though admirably adapted for the purpose, are not so generally in use as they deserve to be; amongst these are the Magnolias, conspicua Soulangeana, Hammondi, and their congeners; Laburnums, Ribes atrosanguinea, and Wistaria sinensis, grown as standards; double Peach, and double Cherry; Weigela rosea, Jasminum nudiflorum, tree Pæonies, and Forsythia viridissima.

FORCING DEPARTMENT.

PINERIES.—We now look forward to every day dawning duller and later than its predecessor, and as the power of the sun declines, so also must our artificial temperatures be somewhat decreased, and in exact accordance with the latter must the amount of moisture be regulated. Till our hothouses are furnished with hygrometers of a simple construction, this matter must still be managed according to the best of our judgment, aided by practical experience. Take care that the quantity of moisture is not so excessive as to condense in quantity upon the glass, &c., close up the laps, or run down into the hearts of the plants. To prevent this, the evaporating trough should be more sparingly filled, and the open tanks closed with moveable tops, giving you the power to confine the vapour or permit its escape. In fine clear weather, when a greater quantity of air can be admitted, the amount of moisture should also be slightly increased. Watering should be done with great care, and syringing is only admissible on the mornings of very fine days. It should be done with a very fine rose, and driven, not into the plants, but into the atmosphere of the house or pit with such force that they may receive it in the shape of very fine dew. VINERIES.—In the anxiety to keep those houses containing fruit sufficiently dry, be careful to avoid the extreme, even in that direction. If the houses are kept too dry by fire heat, the berries will shrivel, an evil nearly as bad, with regard to some kinds, as decay, the result of opposite management. It is easy to comprehend what is wanted, viz., a dry but not an arid atmosphere; but to regulate it to this nicety requires more care and judgment than is generally found, except in a very experienced practical gardener. Let all spare time be now devoted to cleaning the sashes of the different structures, pits and frames included, from the dust and dirt accumulated upon them during the summer. Nothing conduces more to the health and well being of their occupants than the free admission of light.

FLOWER GARDEN AND SHRUBBERIES.

PITS AND FRAMES.—Cuttings which are only partially rooted should be kept warm, and as close and moist as is possible, without running into the dangerous extreme of damp. The additional warmth and moisture here recommended is to encourage them to make a little growth, both at top and bottom, before they are hardened off; and that more time may be afforded for the latter purpose, the former should be effected with all consistent speed. Cuttings which were propagated earlier, and are now fairly rooted, should be gradually hardened, that they may retain their health and strength during winter, in a comparatively cool temperature; this should be managed by keeping them quite cool at night, and by exposing them fully in all dry open weather, when not too cold; taking care to exclude frost from the more tender plants, both by night and day. During the hardening process, the very little water that is necessary should be supplied in the morning; and as increase of size is not the object aimed at, but sturdiness of plant, growing points should be stopped, and all flower-buds carefully removed. Aphides or other insects must be destroyed: and, upon the first signs of mildew, the plants so affected should be syringed on a dry morning, and dusted over with flowers of sulphur.

FLORISTS' FLOWERS.

Occasionally we have blooms or pips of Auriculas sent for our inspection, giving evidence of the mildness of the season; should these blooms come from what is termed a heart stem, they will, if plucked about the centre, often cause the lower part to decay. We have more than once cautioned our readers on this head, and we do so the more earnestly as we lost a valuable seedling last season owing to the stem having been eaten through by a snail; the stem gradually decayed till disease was engendered in the heart, and death was the consequence. Seedlings of this years' sowing will require looking to. If any fibres are out of the ground, cover them with fine soil, or make a cleft in the soil and insert them. CARNATIONS AND PICOTEES, which have been closed in frames during the past week, in order that they might strike fresh root, may have air, and gradually more and more daily till thoroughly exposed. TULIPS.—Plant Tulips immediately. Let the centre of the bed be highest; seven rows in each bed. The bulbs should be planted about 4 inches deep, and 5 inches from each other. It is advisable to cover each bulb with washed river sand previous to finally covering with soil. DAHLIAS.—Their "glory is departed," only, we hope (by taking care of the roots, and stowing them in a rather dry place), that they will gladden us again another season with their noble flowers.

KITCHEN GARDEN.

Let Cauliflowers, under handlights, have all the air possible, protecting them only from frost, rain, and very cold winds. The lights should be quite closed during severe weather only, and the tops should be tilted in wet; but during fine mild weather they should be lifted off and set on bricks, to keep them clean. Watch closely for slugs, and check their ravages by timely applications of soot. A little finely sifted clean coal ashes is an excellent thing for covering the surface of the soil between young plants of any kind, as our slimy friends have an insuperable objection to crawl over it. The same remarks apply to the Endive and Lettuce planted in frames for winter use. Let dead or decaying leaves be carefully removed, and the surface of the soil loosened, to allow the free action of the atmosphere. It is an excellent, but by no means a common practice, to plant Garlic and Shallots in autumn; the advantage is in their commencing to root immediately, and continuing to grow below-ground in all favourable weather during winter, while their tops are not emitted till the usual time in spring. We have often dwelt on the importance of this point as a general principle, viz., affording the roots of a plant an opportunity of getting in advance of the tops.

State of the Weather near London, for the week ending Oct. 24, 1850, as observed at the Horticultural Garden, Chiswick.

Oct.	Moon's Age	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth. 1 foot deep.	2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 29th and 30th, 1833—therm. 67 deg.; and the lowest on the 29th, 1842—therm. 23 deg.

Notices to Correspondents.

BOOKS: *A Young Gardener.* Buy a good catalogue; Donn's or Loudon's. As to the soil, you will learn more by six months' practice than by seven years' reading. For that you may, however, consult Sweet's "Hothouse and Greenhouse Cultivator," or Mackintosh's "Flower Garden."—*New Sub.* We never recommend dealers. See the Advertisement in last week's Number—front page.‡

CAYENNE PEPPER: *G T* says "attention has been drawn to the cultivation of the Capsicum, and to its superior quality when made into Cayenne pepper, compared with the foreign article. It is grown here for the use of a large establishment, but great difficulty is experienced in the grinding process, as the pepper adheres so much to the mill as to make it quite a laborious job." Perhaps some of our readers will favour him with a better system of management.

FRAMES: *J C M.* It is immaterial at what angle you pitch the roof of your frame, provided it has slope enough to prevent drip.‡

KENNEDYA: *C C.* Your leaves are infested with myriads of the white scale insect. Burn the plant, the earth, and the pot immediately, or you will have the whole house infested. We never before saw such an instance of neglect. In such a case no palliative can be applied successfully.

LAWNS: *W C.* You cannot destroy Plantain and Yarrow, any more than other weeds, by manure or top-dressing. Any application that would kill them would kill the Grass. The shortest and cheapest, and only effectual plan, is to weed them out with a spud. There is no help for it.—*J M.* We must give you the same reply to your inquiry about Mouse-ear. In your case, however, after removing it, sift some fine rich soil over the place, and add good Grass seeds.

MONEY: *A Young Gardener.* Two hundred pounds! why, it is a fortune, if you are wise, prudent, economical, and industrious. Ask you master to get it invested in some safe place where you can have interest and be sure to receive back your principal without deduction. The funds are now so high that you had better take some other security.

NAMES OF FRUITS: *Cavanensis.* 2, Beurré Diel, Nov., Dec.; 3, St. Germain, Dec.; 5, Black Achan, Nov.; 6 or 9, Beurré Rance, Feb., Mar.; 7, Doyenné Blanc, Oct., Nov.; 8, Easter Beurré, Feb., Mar.; 10, Bishop's Thumb, Nov.; 4, Winter Nelis, Nov., Dec.; 12, Neill, Nov.; 27, 30, Brown Beurré, Oct.; 31, Glout Morceau, Dec.; 24, Crassane, Dec.; 33, leaf like that of Gansel's Bergamot. In your climate all those that ripen after November should have a south aspect, if you can afford it. The latest best deserve and most require it. For the 8 feet high walls you mentioned, the following Pears will be suitable:—South aspect: Glout Morceau, Passe Colmar, Easter Beurré, Beurré Rance. East aspect: Marie Louise, Winter Nelis, Seckel, Louise Bonne (of Jersey), Thompson's, Suffolk Thorn. West aspect: Jargonelle, Beurré Bosc, Knight's Monarch, Glout Morceau, Passe Colmar, Eyewood, Broom Park, Old Colmar, Ne plus Meuris, Easter Beurré. North aspect: Jargonelle, Comte de Lamy, Flemish Beauty; also the Catillac and Bezi d'Heri for stewing. No riders.‖—*G E.* 1, Bedfordshire Foundling; 2, 3, King of the Pippins; 4, 5, Blenheim Pippin; 6, Court-pendu Plat; 7, 14, Tower of Glammis; 9, Ribston Pippin; 10, Golden Harvey; 11, 13, Beauty of Kent; 12, Wyken Pippin; 18, Alfriston; 20, Hall Door.‖—*T M B.* 4, Passe Colmar; 5, Glout Morceau; 6, Winter Nelis; 7, 8, Beurré Rance.‖—*F Curzon.* 1, Easter Beurré; 3, 4, Old Colmar.—*W Sprague.* 1, Beurré Diel; 2, White Doyenné; 3, Napoleon; 5, Winter Nelis; 6, Grey Doyenné.‖—*R Tongue.* The specimen you had at Exeter is probably correctly named the Moxhay Pippin; a sort so named has been long known in Devonshire.‖—*F W.* The Grape from Naples appears to be the Black Frontignan. It is not quite so round, but that is probably owing to its being a small bunch, produced, as you state, from a recently planted Vine.‖—*Autumnus.* The three varieties from pips of the same Apple, a Nonpareil, were of very different qualities. No. 1, conical, *pale*, flesh white, pleasant. No. 2, small, conical, somewhat angular, *red*, flesh tough, very astringent. No. 3, small, ovate, not angular, flesh both acid and astringent. The Apple accompanying these is the Trumpington, or Eve Apple of some.‖

NAMES OF PLANTS: *J G.* We cannot name plants without both leaves and flowers. You have only sent the latter of your Cereus, which looks like an unpublished species now in flower near London; but may be very different.—*J Trotter.* It is merely the Oak-leaved, or various-leaved, Hornbeam, a variety of the same nature as the fern-leaved Beech, the Gooseberry-leaved Alder, and the like.—*Gamma.* Not Cinnamon, but Cassia. It requires a good stove heat.—*Vitis.* Pteris serrulata. *S.*—*W B.* The Latin for Water Lily is Nymphæa.—*Ignoramus.* The Syringa is Philadelphus coronarius.—*R E, Livonia.* The Cape Gooseberry is called by botanists Physalis edulis; its fruit is harmless, and is liked by some persons. It is best treated as an annual, which should be raised from seed in a hotbed in the spring, so as to get it forward, and then be planted in the open ground as soon as frosts are gone. Possibly it may bear a Devonshire winter, but it is tender near London.—*X Y Z.* 4, Malope malacoides, a hardy annual; 5, Kaulfussia amelloides; 10, Rudbeckia laciniata; 2, Senecio Cineraria, *alias* Cineraria maritima; 6, Aster rubricaulis; 9, Scutellaria Columnæ; 8, Dracocephalum virginianum; 3, Cytisus biflorus; 7, Achimenes rosea, not fit for a bedding plant; 1, Heimia salicifolia. — *Todd.* These are not determinable; single wretched flowers, with no leaves, no stem, no intimation of habit, or of native country, can only be named if they chance to be accidentally recognised; we regret to say we have no Œdipus at our command.—*W B P.* We cannot undertake to name leaves without flowers.‡

PEACHES WITHOUT LEAVES: *T D.* We did not doubt that you had accidentally obtained Peaches without leaves beyond the fruit; but that is very different from obtaining them without any leaves whatever.

POTATOES: *R M J.* Raw Potatoes cannot properly be called poisonous. The deleterious matter resides in the leaves and "plums," or fruit. What little exists in the Potato itself is in the skin which is peeled off.

VERONICA LINDLEYANA: *A M.* It is nearly hardy.

VINE BORDER: *R D.* Cover it with stable litter.

MISC: *Enquirer.* Couve Tronchuda will not bear frost, and should be consumed now. Plant the Potatoes 18 inches from row to row, and 9 inches in the rows. We by no means recommend earth to be buried when frozen; it will certainly chill the soil for a long time afterwards.—*R S.* Something is possibly wrong with the root of your Mandevilla; in similar situations it usually flowers freely. We would not cut it down; see that the roots are right, and give it another trial. No use can be made of the fruit of the Snowberry, except giving it to pheasants. No use can be made of the fruit of Lycium barbatum, nor of that of the Sumach; the latter is poisonous. Jute, we believe, is a substance of the nature of Hemp.‡

SEEDLING FLOWERS.

FUCHSIA: *Cavanensis.* Box and flowers crushed to pieces in coming through the post.*

GLOXINIA: *W G.* Not equal to many of the light kinds now grown.*

DAHLIAS: *G M M'I.* Your seedling is of a colour in which we abound. A crimson to be valuable must be very superior in form. Yours is only middling in that respect.*—*E T.* A large showy yellow; but the petals are too long, and the flower is generally too coarse to be useful for the purposes of exhibition.*

SMITHFIELD CATTLE SHOW.

NOTICE.—THE PRINTED FORMS OF CERTIFICATES to be filled up for STOCK and IMPLEMENTS intended to be exhibited at the forthcoming Show in December next can now be obtained of the Honorary Secretary. All such Certificates must be returned, properly filled up, on or before **Saturday, the 16th of November.**

In applying for the Forms for Stock, it is necessary to state the Number of the Class or Classes, as there is a separate Form for each Class.

Prize Sheets and all information can be obtained on application to B. T. BRANDRETH GIBBS, Hon. Sec., corner of Half-Moon-street, Piccadilly, London.

AGRICULTURAL EDUCATION. — The Steward upon a large estate, in the South of England, has a vacancy for a well educated youth to be instructed in farming and general business. For particulars, address X. V., Office of this Paper.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Clover Manure, per ton	£11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.

CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
FISHERY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY.

"Do you bruise the Oats you give your horses?" "No."
"Then you lose one bushel out of every three, and your cattle do not half so well."

MARY WEDLAKE AND CO.'S OAT-BRUISING MILLS. Superior Chaff Engines, simple in construction doing from 50 to 500 bushels daily, and more. Almost all brewers and coachmasters in London use these implements.

118, Fenchurch-street, London. A pamphlet on the above, by sending 12 postage stamps. Chaff-cutters, Linseed, Bean, and Malt Mills.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S
Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed, charged from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

WARMING.

HOT-WATER APPARATUS, with improved Boilers, requiring no brickwork, and arranged to continue in action from 12 to 16 hours without attention, adapted for Churches, Chapels, Conservatories, and every description of Building, supplied and erected on the most reasonable terms.

Also the THERMANTERION, an apparatus which warms without injuring the air, and recommends itself on account of its simplicity, durability, efficiency, and economy, especially adapted for Churches, Chapels, Halls, or Buildings, only used occasionally. — Apply to SPILLER and TAYLER, Engineers, Battersea.

MITCHELL'S MINERAL BLACK PAINT. — This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by

JAMES PHILLIPS and Co. (the sole agents), 116, Bishopsgate-street Without, London.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

The Agricultural Gazette.

SATURDAY, OCTOBER 26, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Oct. 31—Agricultural Imp. Society of Ireland.
WEDNESDAY, Nov. 6—Agricultural Society of England.
THURSDAY, — 7—Agricultural Imp. Society of Ireland.

AGRICULTURE is being thoroughly looked into. "*Times* commissioners" are darting about the country; amateur ARTHUR YOUNGS are feeding the rural journals with farming "notes" made on their railway routes; and it is not at all surprising just now to see one's-self or one's farm management in Roman type in the papers. Perhaps this public scrutiny may exert a salutary influence upon many agriculturists: where anything is grossly amiss it will be rectified from the fear of exposure—

"If there's a hole in a' your coats,
I rede ye tent it;
A chiel's amang ye takin' notes,
An' faith, he'll prent it."

Such investigations into the state of the agricultural districts are of weighty importance; for very many reasons. They show the causes which have impelled one district farther ahead than another in the march of improvement. They inform the cultivators of a certain soil in one locality of a hitherto unknown but excellent practice pursued upon the same soil in another locality, and thus extensively diffuse good points of husbandry. They show what systems and methods and conditions ought to be guarded against, and which should be embraced and adopted. By exhibiting the universal farm practice as it exists at the present period, they show what things are inconsistent with the fundamental principles of agriculture; and by publishing the effects of climate, tenure, &c., upon the land and its cultivation, and of the breeds of cattle, &c., upon the profits of the farmer, they constitute a fund from which new principles may be drawn. By some persons it is thought that, from a skilful comparison and digestion of the items comprised in the aggregated and complete representations of district cultivation for all Great Britain, the most correct code of rural laws and principles might be constructed. The value of such information was felt by the Board of Agriculture, when, half a century ago, they planned and executed a variety of agricultural county "surveys;" the same feeling has animated the Royal Agricultural Society in its present prosecution of county "reports;" and the public periodicals abound with descriptions of local and general husbandry, because the pressure of the times demands a thorough examination and revision of farms and farming in every point. While much may be learnt by comparing the present husbandry of different localities, an historical comparison of the different accounts will be no less valuable. This shall now be shown by an example.

As regards the county of Lincoln, celebrated for its agricultural achievements, the survey of ARTHUR YOUNG at the close of last century, Mr. PUSEY'S paper on the agricultural improvements of Lincolnshire, seven years ago, and a statement of the agriculture at the present period, when compared together, will discover the nature and amount of the progress that has been made. The "wolds" of that county are a range of chalk hills, stretching south-eastward from the Humber for 45 miles, with an average width of about 6 miles. The advancement of husbandry upon these dry uplands parallels the improvement on the wet Fens. In the middle of last century these hills were a succession of rabbit warrens from south to north. Fifty years ago the surface had been so far improved that many thousands of acres of open field were subdivided by inclosures, and the four-field system of cropping had established itself over large breadths of land. But, still, warrens overspread a wide tract of the loftier hills, and the surface was covered with Gorse for many miles. Among the scattered remarks of ARTHUR YOUNG—who printed his notes and memoranda instead of combining them into a description, and states them under the heads soil, rent, tenure, rotations, &c., instead of districts—occur the following: "From Louth to Caistor, 18 miles, 10 of it are warrens, chiefly silvers (rabbits); rent, 2*s.* an acre." Again, "the wold land about Louth, to the west and south-west, is good; very generally a dry, friable, loamy sand, on a flinty loam, and, under that, chalk everywhere: this is the soil on the warrens between Gayton and Fathwell, which I passed, and I was much hurt at seeing such land so applied. I exclaimed to Mr. CLOUGH, on seeing it; he replied, 'Oh! it is good for nothing but rabbits; what would you do with such poor land 2 or 3 miles from the farms?' When men have long been accustomed to see rabbits on such deserts, and hear only that they are good for nothing else, they come to think with their neighbours, let the absurdity be what it may. But here are no leases, and therefore can be few permanent improvements. These silver-grey rabbits answered better when their skins sold high. The friable surface loam is various. There is much excellent, and also some rich pasture and upland meadow on it, and of all degrees of quality; and, on the sides of the hills, great spaces covered with rushes, from springs, but not a draining idea, except of paltry grips that are all in vain. But to drain well demands leases." Turning northward, he observes, "The tract of wold north of Louth exhibits a great variety of excellent soil—all calcareous, friable, sandy loams, on a chalk bottom—dry enough to feed Turnips, and much good enough for Wheat. The red chalks are particularly good, being almost without exception excellent for Turnips and Barley. At Thorresly warren the vales are red, and Nettles are among the spontaneous growth. Nettles and rabbits together! Toward the northern extremity of this chalk range, he says, "Near Brocklesby, &c., there are large tracts of excellent land under Gorse; and at Cabnum and Swallow I passed through the same for miles. It is a beautiful plant to a fox-hunter. Lord YARBOROUGH keeps a pack of hounds; if he has a fall, I hope it will be into a Furze-bush; he is too good to be hurt much, but a decent pricking might be beneficial to the country." Inclosure, however, since that time, has extended its fences in every direction, and all the open fields have disappeared; a great part having been enclosed within the last 30 years. The Gorse has been grubbed, the rough sward burned, and all the warrens, with one or two exceptions, have been brought into good cultivation. None of the ground has been left as sheep-walks in its primitive vegetation of Heath and Fern, like the Downs of the southern counties; but the highest points are all in tillage, and the whole length of the wolds is intersected by neat White-thorn hedges—the solitary Furze-bush appearing only where the plantation border, or a road-side offer an uncultivated space.

"This high range," writes Mr. PUSEY in 1843, "equal in extent to the county of Bedford, is now a pattern of neat fences and good farming; while the present Lord YARBOROUGH remembers when, in riding from Spilsby, the southern point of the wolds, to his seat at Brocklesby, in sight of the Humber, he met but two fences." He gives an enthusiastic narrative of his tour: "On a sunny morning in November, 1842, farm succeeded farm, each appearing to be cultivated by the owner for example—not, as was really the case, by a tenant for profit; and so for miles we passed on through fields of Turnips, without a blank or a weed, on which thousands after thousands of long-wooled sheep were feeding in netted folds; and so large as well as regular were the Turnips in the narrow rows, that the lower halves which remained in the ground,

when the upper part had been consumed, seemed to pave these sheep-folds. Every stubble-field was clean and bright; all the hedges kept low, and neatly trimmed; every farm-house well built, with spacious courts, and surrounded by such rows of high, long, saddle-backed ricks, as showed that the land did not forget to return in August what it had received from the fold in December, since the number of these farm-houses, which might always be seen at one view, proved that the size of the farms would not account for the extent of the rick-yards. Yet this land, so loaded with roots and with corn, showed no mark of natural fertility."

Referring to his first view, in 1842, of Lord Yarborough's estate, then comparatively unknown, its fine farm buildings, on which 150,000*l.* had been expended, its 30,000 acres of good Turnip land, divided by clipped hedges of thorn, where Young saw miles of Gorse, and of course thousands of rabbits, he says, "I thought I had made the discovery of a domain equal in the spirit, magnitude, and rapidity of its improvement to the well-known estate of Holkham; and having seen it again last October—though, in consequence I suppose of the weather, the Turnips did not look so well as before—I think so still. Mr. Young was informed by the late Lord Yarborough that his wold land then let for 5*s.* an acre. I may state that, tithe-free, it is now worth *five times that amount:* and great as is the change on the Brocklesby estate, it is not greater than the general change of the chalk hills. The first step was, of course, grubbing the Furze; paring and burning the rough peaty Grass—the latter costing a guinea per acre. Then there was brought a heavy dressing of chalk, 80 cubic yards to the acre, costing at the time 66*s.*; last, followed 60 bushels of bones, for bones were cheap in those days, and a bushel cost but 1*s.* 3*d.*, making another item of nearly 4*l.* I am told that the wolds have been chalked twice over; and that, without chalking, the Turnips are destroyed by the excrescence called 'fingers and toes;' but even the first outlay of the tenant amounted to more than 8*l.* per acre. And here I must state that this large sum of 8*l.* per acre, or 8000*l.* on a farm of 1000 acres, has been expended on the farms at Brocklesby (according to the practice of Lincolnshire), only through well-merited confidence in the owner. Nor has the spirited outlay on the part of the farmers been without its return. The parish of Limber, 4000 acres, was formerly let to four tenants, at 125*l.* each, or 2*s.* 6*d.* an acre, and all four became bankrupts. It has been inclosed, is now well farmed, and at the present rent the tenants are doing well. In some instances, considerable fortunes have been made. The three points of ordinary chalk-farming in Lincolnshire are, first, thorough chalking of the land, repeated when the first covering of chalk is worn out; secondly, liming the whole of the Turnip crop at 12 or 16 bushels per acre, to which farmers are often bound by their agreements; thirdly, keeping always in winter a large number of horned cattle in the yard, which, being fed on oil-cake, convert the straw into excellent dung."

Fifty years ago (viz., 1799), the rental of the wold district was about 9*s.* per acre; now it is probably 25*s.*; and many thousands of acres have been improved from the value of 3*l.* and 10*l.*, to that of 30*l.* per acre, and large tracts have been improved within a few years from 10*s.* to 30*s.* per acre rental. As the soil has to be "made" and maintained by the art and capital of the farmer, the amount of produce is very variable—depending mainly upon the treatment which the soil receives. The yield fluctuates from 2½ to 7 quarters of Wheat per acre; and the general opinion seems to fix the average of the whole district at about 4 quarters. With high management, 7 or 8 quarters per acre of Barley, and Oats of good weight, 9 or 10 quarters per acre, are frequently obtained. When Young made his survey, the produce was estimated at 2 or 3 quarters per acre of Wheat, 4 quarters of Barley, and 5 quarters of Oats. The two crops upon which the success of wold farming depends, are Turnips and seeds, the whole of the former, and most part of the latter, being consumed on the land by sheep. The corn crops are Wheat, Oats, Barley. In Young's time the common rotation at Limber was—1, Pare and burn for Turnips; 2, Oats or Barley; 3, Oats or Barley; 4, 5, 6, 7, seeds; 8, Peas or Oats. He writes, "For some miles on the wolds, about Louth, they are very good farmers; indeed, in respect to course, the following singular one is common; 1, Turnips; 2. Barley. They assured me that this land, though of 15*s.* an acre, would not do to add Clover and Wheat. And upon their poorest soils, another that has merit. 1, Fallow; 2, Oats; 3, Fallow; 4. Oats; 5, 6, Seeds. Upon my objecting to so much fallow on light land, Mr. Cluff, of Gayton, assured me, that upon these distant parts of their farms, they could not get Turnips without so much dung as would not answer to carry, nearly so well as to lay it on their better lands; that in this way they could get 6, 7, or 8 quarters of Oats, which answered much better than any other way of managing." Forty-four years after this, Mr. Pusey is found to remark, "Another feature of Lincolnshire farming is, that not only is the whole farm in field, but that, however large the farm, *all the fields are treated equally well;* while, on other parts of the chalk hills (in the southern counties), an outlying field may be used for 20 years without any manure, because it is too distant from the yard for the carriage of dung, and lighter manures are not bought for it." The four-course system extensively prevails, but cannot be denominated the "wold system," as over a great part of the district the Barley is found to have too strong a straw after Turnips, thus injuring the young Clover, and the farmers therefore practise a five-field course: 1, Turnips; 2, Oats; 3, Wheat; 4, seeds; 5, Wheat; whilst, particularly in the northern parts, is an alternating four and five-course rotation; the five-course arising from grazing the seeds two years. The usual practice is to apply all the farm-yard manure to the root crop; but many farmers manure the seeds instead. This dung is made by beasts in the yards, fed on straw and oilcake—the average cost of the Linseed cake being certainly not less than 20*s.* per acre annually. Only a few Swedes are grown, and but few roots are drawn off the land. Crushed bones, from 8 to 16 or 20 bushels an acre, are invariably sown with the Turnips; and guano, Rape-cake, &c. &c., in large quantities are used in addition.

Little enquiry need be made as to the state of the drainage: the porous chalk rock drains its thin covering of light soil perfectly; except in some of the valleys, and midway on the dip of the hills, where the land is often wet with springs. The rushes witnessed by Young in such situations have ceased to vegetate, owing to the construction of all the under-drains required. The loftier farms do not need an egress for the downfall water so much as an impervious bed to hold drink for the stock. All the great improvements have been accomplished without the security of a lease; but a system of tenant-right universally prevails, founded upon the ancient custom of the country, and fixed in each case by valuers. Seven years are allowed for the entire exhaustion of marling, claying, chalking, and similar investments of the tenant's capital. Landlords here are generally faithful in discharging their obligations to the tenantry; the buildings are usually commodious, and the farms have been held by the same families upon the bond of "a mutual understanding," with all the certainty conferred by a legal contract. With their smaller occupiers, the labourers, however, the case is, for the most part, different; these they have driven far from their places of employment into crowded freehold villages, with a view of escaping the pressure of the Poor's-rate. Work is plentiful, wages 9*s.* or 10*s.* a week; and piece-work is being done in almost every season. Allotments are thinly scattered; pigs universally kept. From the foregoing particulars some facts may be gathered as to the causes of superiority in the culture of chalk soil. *I. A. C.*

THE MASTER AND THE SERVANT.

A Village Lecture.

(*Concluded from p.* 668.)

It is not possible, I believe, to urge too strongly what I have already said, but it is quite possible to do mischief by leaving out another aspect of the matter which requires to be dealt with also. And there are some who speak so harshly—as I may seem to have done—on the best way to improve the condition of the labouring class, whose doctrines differ from the whole truth on that subject as much by deficiency as those of Louis Blanc do by contrast. They omit from their speculation a reality which *will* make itself known, whether it be neglected or not—that though the duty of paying higher wages does not exist, the duties of Neighbour are binding upon all of us as much as those of master upon some, and those of servants upon others. And it is by the due performance of these duties, I believe, that those seeds will be sown from which the growth of higher wages and improved circumstances may be expected.

The whole truth, as regards master and servant, presents these two aspects; and while in the one it exhibits to us two honest men who are actuated by no other sentiment than that sense of justice which claims its due—exchanging with one another labour for money according to the market value of the former—in the other it presents to us these same men as equals in a far higher sense than that in which they are respectively master and servant—as *neighbours* claiming mutual sympathy, and the expression of that sympathy to the extent of their respective abilities.

Now I have already detained you so long that I must not refer at any great length to the ways in which intelligent neighbourly kindness will show itself. It is not, I am sure, by requiring or by paying wages beyond the natural amount; and it is not by the indiscriminate relief of distress, whatever its cause. The *mode* of paying wages is, however, a consideration deserving our attention. Piecework, the only way in which due credit is given to the ability of the man, is a far better way, whenever it is possible, than work at day's wages. And I would submit, both to the masters and the labourers present, whether it might not be a good thing for both to adopt the practice of paying wages in *kind* to a greater extent than it now is done—whether the advantage on the side of the labourer in dear times, and on the side of the master in cheap times, united with the advantage to both of avoiding the expense attending the exchanging of the produce in the first place for money, and of the money in the second place back again to produce, does not result in a benefit on the whole to both parties.

Another point in which the subject admits of influence by a kindly and intelligent disposition, lies in the fact already alluded to, that wages depend on the proportion which obtains between the employment found and the number of people wanting it. I believe that the one may be increased, and the other diminished with advantage to both parties. I believe, for instance, that even at present prices a good deal of our second-rate Grass lands would pay better if broken up, and a good deal of land now farmed with but little labour would pay better if farmed with more; and I also believe that to emigrate to Australia, or New Zealand, or America, is beneficial to any labouring man who can muster the means to pay his passage. The one would increase labour, the other would diminish labourers, and thus wages would naturally rise.

Mr. Bravender, of Cirencester, tells us in a paper he published lately in the "Journal of the English Agricultural Society," that according to his calculations—and he is a good authority—every acre of down land broken up would increase the labour now spent on it six-fold, and would pay the occupier 1*s.* over and above the ordinary profit on the increased capital he must spend. Every acre of light sandy pasture would, in like manner, pay him 8*s.* 6*d.* a year, while its labour was increased four-fold; every acre of stiff clay pasture would pay 4*s.* a year and increase labour eight-fold, and of good Grass land 4*s.* or 5*s.* a year, while its labour would be doubled. If 4,000,000 of acres of land now in second-rate Grass were broken up, the employment they now give to 43,000 men would be increased so as to maintain a body of 170,000 men. The country would benefit at the same time by more food, and the landlord by more rent. Then again as to high farming, in place of low farming, were the capital invested in arable land to be 12*l.* an acre, instead of 6*l.* or 7*l.* as it now generally is, I believe that the farmer would profit more, and I am sure the labourer would do so too. If I had 1000*l.* to start farming with, I would spread it thickly over a small farm rather than thinly over a large one. If I had but 10 hands I would not freight a ship which required 20. No doubt she would much more rapidly carry the goods I wish to export; but then storms might come, and I could not manage her. It is my interest to take a smaller vessel and man her thoroughly, that so I may take advantage rapidly of any change of weather, and that so I may be able to work her safely when she is in danger. Besides I can have the smaller vessel for less money. Just so with the farmer; it is his interest to take the smaller farm with the smaller rent, and man it well. He will find himself better able to carry on a thorough cultivation, and he will be able to work it with more safety and profit in difficult times. There is an immediate and close connection between the style of farming in a country and the condition of the labourer. Go where there is nothing but dairy farms held from year to year, and you will be sure to find wages low. Go where arable cultivation prevails—where the land being let on lease has secured its occupation by men of capital and intelligence, and you will find its labourers better off. Compare Somersetshire on the one hand, with Northumberland on the other—Grass lands and poor wages—with good arable farming and a well conditioned peasantry. By seeking for profitable modes of employing labour, then, much good can be done to labourers by those who are at the same time doing good to themselves, and it is in this way that machinery benefits the labourer—it increases the profits of farming, and so enables farmers to cultivate their land more energetically and more laboriously; but this is a wide subject, and I must not discuss it now.

And landlords are able to benefit labourers not only indirectly, by adopting such a mode of managing their estates as shall induce an intelligent and energetic tenantry to settle on their property, but also directly in a variety of ways. I may refer, for instance, to their setting agoing the allotment system as unquestionably of great benefit to labouring people. It is quite a different thing this from the small farm system. I do not believe that labourers would benefit by the land being all divided out into small farms. I would indeed have farms of every size; a series from 10 acres up to that of largest size. No where should there be an interval so great as that a man determined to rise might not succeed. I would have the ladder up which a man should climb as he improved his condition—with plenty of "rounds" in it, and those near enough together to allow of an ascent as easy as possible; the platform of the middle classes should be accessible from that of the lower classes by ladders enough—but that is a very different thing from lowering the platforms themselves. I would have the majority of farms from 200 to 500 acres, not from 20 to 50; but then there should be

some of 20 and 50 and 70 and 100 and so on, up which a man with improving means might rise. And then again I need not say how landlords might improve the condition of their poorer neighbours by improving the condition of their cottages—a matter on which, I have no doubt, many a labouring man here would wish me to enlarge. They are, indeed, in many instances, a shame and a disgrace to the country; and so long as but one room exists in which a whole family lives by night and by day, how can the head of that family—desirous of it as he may be—hope to see his children improve either morally or materially upon the condition he himself now occupies. But I have not time to speak further on this.

Then again, to diminish the number of our labourers—to induce some of them to emigrate may be a good thing. I am well aware that emigrate as we may, our numbers will increase just up to that stage at which the standard of comfort obtains with which the majority are contented, and constant emigration may not be a perfect cure for low wages. Yet I believe that we shall often do better to consider and act upon the merits of individual cases, than to stop and think how our conduct influences whole masses of people. And if I thought any young man would benefit himself or his friends by going to some of the colonies, I would advise him to do so; for if I thought my own station and that of my friends would be improved I would go myself. And I do believe that many of you would do much better in America or Australia than you can do here. We shall have in a few days in our library works descriptive of the different colonies, giving accounts of the value of produce, of employment in each, and the cost of travelling to each, and so on; and I strongly advise you to study them closely.

And now I come to the most influential way of all, as I believe, in which neighbours can benefit one another, and that is by urging and assisting one another in the adoption of all possible methods of improving the mind. Wages may increase, and the means of comfort increase, but unless labourers at the same time rise in the scale of moral and intellectual excellence, I assure them they will be but little benefited. If by the education of children we could only implant the aim at a higher standard of life—the aim at intellectual pleasures—they would endeavour so as to attain them. And it really is wonderful the amount which small savings amount to in a short time. In a single year I told you 50,000,000*l.* are spent by the people in spirituous liquors. Now, can anyone doubt that if all that money had been rather thrown into the sea the country would on the whole have been better. I am not going to read a teetotal lecture, but I cannot hide from myself or from you the fact that three-fourths of all the people in our gaols, our unions, and our mad-houses, are sent there by intoxicating drinks. Well then, but supposing that instead of being thrown into the sea, it had been spent on school-rooms and emigrant-ships!——You may depend upon it that it is by their own savings—it is out of their own exertions—that the condition of the labourer is to be improved—the thing can be but little influenced by any one else. And when they shall come to see their true interests, and where their efforts should be made, this will appear. The employment of an intelligent economy by the labouring man is likely to work an amazing improvement in his circumstances. But on this I must not enlarge. I hope for an opportunity hereafter of addressing you on the subject of benefit societies and savings' banks.

But I cannot avoid saying a word or two on the importance of right school education. My friends, it is an unquestionable fact that there is but one truth which is all-powerful for our improvement whether morally or materially—but one tree whose leaves are for the healing of the nations: and these are revealed to us in our Bibles. And if any parents here, desire to see their children better off than they are themselves, let them send them to the Sunday-school, and urge upon them attention to the lessons they receive there. But there are other truths also, truths which are of immense importance, and of these also I would urge the necessity. Education, religious, moral, intellectual, is really the most desirable thing going. Do you think that those children who are left in dirt and recklessness to spend their time, as best they may, upon our road sides, are not being educated; they are being as surely led into a path, and urged along it, for that is all the word means, as those who go to school; but the path they are travelling leads to poverty here, and misery hereafter. It is the *right* education of the mind, and of the affections, that is the desirable thing.

There are labourers living in some parts of this country, and of Ireland, whose existence is almost entirely one of the body; their minds are a blank. Oh! what a pitifully vegetative life they lead. They are surrounded by glorious sights and pleasant sounds in everything around them; but they know it not. All the wonderfully numerous and abundant sources of pleasure which a God of mercy has placed us in the midst of, are shut to them. Having eyes, they see not; having ears, they hear not. Every intelligent man deplores their condition; but they do not perceive it themselves. And if any one says that that is an answer to my whole complaint; if any one says that because the people are sleeping quietly, though they are in the midst of wretchedness, they should not be awakened; if any one says that I have not described their condition, so much as the misery which would be consequent upon its circumstances, if they could be imposed upon others, for that I am supposing them to be possessed of sensibilities, which, as they are the result of education, they do *not* possess. I say, misery may be none the less real, because it is unfelt; and he who is the most alive to the inferiority of the moral and mental status of any class, is the best advocate on their behalf. What does this objection amount to? I am aware that the idea of a dreary blank in connection with the life of a horse or a dog, ought not to excite our pity, because these animals are incapable of anything better, and fulfil the highest purposes of their existence, notwithstanding. But will any one reason, from the less to the greater, across the tremendous gulph which here intervenes. The brute creation are always at their best, for they are guided by instinct from the beginning; but the mind of man was created for education. And looking at the degraded condition of our poor in the alleys of our towns, or on the bleak moors of Ireland—will any one pronounce the pity expressed to be absurd, because the sensual and vegetative life it deplores is insensible to its own degradation? Sensibility might be conferred upon the lowest. For he has eyes, though he sees not, and ears, though now he be deaf. And the education we advocate will awaken the dormant powers of which he is possessed.

Now, if what I have said to-night should enable any young man to see that there is a road possible for him by which he may climb his way upwards to influence and respect. If it should induce any one to start vigorously to work upon this ascent, by adopting every means to improve and correct his mind, and intelligently to economise his means. If it should strengthen and nerve his resolution to overcome. Ah! it is not to subdue the will—it is to strengthen the will and direct it aright upon the right things that is wanted; take the poor of Ireland, and you have the most subdued will in the world, and thus it is that they are contented to live listlessly in their wretchedness. If, again, what I have said should strengthen in any who have the means the desire to encourage those who are evidently doing their best for themselves—what a capital thing it would be! And let no one think that the single impulse of an energetic exhortation will do the thing. My friends, I will tell you a truth. In this, as in other things, you cannot get on but by God's assistance. "To him that hath shall be given," means just this—that whatever the step we have just successfully achieved—we shall, in the very act of laborious and successful effort, have acquired, by God's blessing, the strength and the resolution, more easily to take the next. And there is no need to despair of rising, even in this country, where the difficulties certainly are greater than in some other parts of the world.

Remember, each one of you, that as you hope to succeed, you must trust to no one but yourself. Accept, eagerly, the offer of mental improvement wherever you get it; and give assistance in this way wherever you can. It is in the success of individual effort, however, after self improvement, that we must look for the improvement of the whole body.

People are apt to forget this; and they are fond of talking of the relations in which different classes stand to each other, and they are apt to attribute all the ills of society to the faults which they find here. And pauperism, according to them, is so prevalent because of the faulty relation in which the moneyed classes stand to the labouring classes; and a hundred evils are laid at the door of those who would preserve a class of non-electors, and exclude our intelligent workmen from the class who choose our members of Parliament. And if only the relations were corrected in which different classes stand to one another—the rich to the poor—the landowner to the farmer—the capitalist to the labourer—the manufacturer to the tradesman and the consumer—all would be right. Now I admit most fully the great importance of all these relations being put upon a right footing. I admit the great importance of holding and of propagating right notions on political subjects such as these. I would do away as much as possible with those distinctions between classes which only make them foolishly distrustful of one another. I should be glad if the choice of our law-makers were more in the hands of the working people of this country than it is. I would in this as in other respects aim at destroying, or rather at outgrowing, that exclusiveness which gives rise to class differences and class interests, where national interests alone deserve consideration. I believe that class distinctions will gradually in a great measure disappear, and that all men will by-and-by be regarded with respect, as some are already, in proportion not to their wealth or their power, or anything else that is merely temporary about them, but in proportion to the worth of their immortal part. But let no one think that by settling the *relations* of the different classes in society he will put everything to right. Government may be related to subjects, taxers to the taxed, those who make the laws to those who obey them, capitalists may be related to labourers, masters to servants, with absolute justice, and yet society may tumble to pieces, and anarchy result out of it all, as it has done with monarchies, and empires, and republics, enough before now. The millennium of happiness for which we look, will not be the creation of politicians, whatever the instrument, whether a reform bill or a charter, by which they expect to accomplish it. It is not by the correction of mere relations that everything is to be put right. Masons know this well enough. The curve, as has been well said, may be turned most truly, and brick laid to brick most perfectly, the relations of the parts may be absolutely correct, and yet remove the centering and the arch shall tumble. The fault was not in the relations of the parts, but in their *individual quality*. The bricks had not been burned properly, or the materials used had not sufficient strength, and no skill in putting them together could make up for that. Just so in human society; the work of improvement must proceed in individuals, before it will show itself in nations. The requisite standard of quality must exist in the individual pieces, before the skill of the politician can erect out of them the perfect arch—firm, useful, and elegant—to which a well regulated state of society may be compared. Millennium must come in the hearts of individuals before it will show itself in the condition of nations. No doubt there is a good time coming, good materially, as well as morally and intellectually, for prophets as well as poets tell us that. But let us not think that it is to be the surprising consequence of some new discovery, which is all at once to remodel the face of society. It will be but the latter end of a process which has long since begun. The *time* of it will not come upon us all at once; whatever its period, it will not arrive until each of the intervening minutes, with all its efforts and results, has passed us by. And neither will the *goodness* of it come upon us by surprise. The standard of excellence which shall then prevail, will have been achieved by the successive experience of all the intervening stages. Like all other growths, the result will be produced by the continual addition of atoms, and the man who has crushed an evil habit in himself, or done a single act for the real benefit of his neighbour, may be more truly said to have helped on that good time, for which all mankind are looking, than the whole race of political speechifyers. For it is just as *each* of us improves, that *all* of us improve; it is just as individuals rise, that the whole body will rise, in the scale of excellence and happiness.

That is the great lesson for each one of us to keep in mind. Our individuality on the one hand, and our relations to society on the other. Our companionships and our friendships, distract our attention from the one, and our innate selfishness makes us apt to forget the other; but each of us must remember, that in a most tremendous sense, he is solitary among men, beyond all human aid, depending on himself alone, standing or falling for ever, according to his own will and conduct, with no possibility of help, from friends or relations, or those who now surround him, and now appear so near. And he must also remember that he is one of a body of persons, bound together by strong sympathies, on whom mutual influence is not only a possible, but an unavoidable thing; a body which, in virtue of these sympathies and this influence, rises or falls in the scale of excellence, with every step in advance or retreat of every one of its members. Personal individuality, and social relationships! the right way to connect the two is to labour after self-improvement, for the sake of being useful. And I declare:—The young man, whether he be gentleman or labourer, who is rising up into life with no thought but for himself, and no desire but for the attainment of comfort and station, and respect for himself, does not deserve the life or the position which God has given him. And if that shall be his motive through life, he will find at the close of it that he has made a lost venture, that it has turned out one great failure, fruitless of good to others, fruitless of good to himself—so true is it that the end and object of selfishness is really attainable only by disinterested and unselfish behaviour—as Job found, who regained his wealth when he prayed for his friends.

Let us remember our individuality, then, and act so as to preserve our self-respect, and to attain the respect of others; and let us remember our brotherhood also, and whether it take the form of friendship for our neighbours, or patriotism for our country, or philanthropy towards all mankind, let us always do all in our power to recognise and to strengthen the sympathies and mutual interests that are at the foundation of that social happiness which politicians pretend is at their command, but over which, in reality, they have so little power for good. *M. S.*

STEAM-POWER AND THE HOMESTEAD.

Let us enter the homestead. As we proceed thither I will read to you the words inscribed on my test papers, by which I am to ascertain the propriety of any application of machine power. 1st, that the abundant introduction of machinery to a human practice, instead of displacing, should have a tendency to employ more hands; and 2dly, that the steam-engine should accomplish a maximum amount of effect by a minimum expenditure of power.

Here we are in the homestead; and there you see various excellent pieces of mechanism in full operation—specimens of workmanship such as an English mechanic alone can produce. There you see going on corn threshing, Linseed crushing, Beans splitting, Oats bruising, Barley grinding, sacks lifting, chaff cutting, &c. As was anticipated, you here see the human hand profitably employed, not displaced. Now-a-days there need be no hesitation on this point; lately, a gentleman, who on an infertile heath has undoubtedly caused at least four blades of Grass to grow where but one grew before, has recorded that his bailiff, who lived on the farm before this sort of machinery was introduced, told him he used to have 6*d.* change out of 2*l.*, for a week's labour on that very farm; whereas, we may now justly infer this gentleman seldom sees a 6*d.* returned out of four times that sum, paid for a week's labour.

Now, as Mr. Hoskyns has well pointed out, the use of the true or highest order of mechanical movement is the prime cause of the efficiency and celerity of these

machines. You know well what the old vertical hay or chaff-cutting engine could accomplish in an hour, but you see a machine intended to perform a similar operation, when endowed with the highest order of mechanical movement, cutting with ease 1000 bushels in an hour. The magic lies not in the keenness of edge of that knife, for it probably is not sharper than it was in ancient days; no, if there be magic, it is in the movement. However, let us proceed. There is nothing to be said against these machines, but everything in their favour; instead of discharging man from employment they have tended to furnish him with it. See, there is my old friend, the steam engine, has just completed his day's work Let us go and see the result of his day's labours. You observe this is a six-horse-power engine; and here is the sum of his day's work. "If you look to the right," as the showman has it, you will observe a body of straw as big as a hay-stack; that illustrates the power required. If you look to the left, you will see a heap of corn and chaff as big as a hay-cock; this represents the result.

Now, this unsatisfactory result in threshing cannot have arisen from any defect in the steam engine; it has exhibited its great and unflinching power, as that stack testifies; moreover it has developed every important characteristic I have before called your attention to. It has consumed an inexpensive coal food; the continuous circular movement has prevailed throughout its working; it has shown that its six horses united into one have proved themselves equal to 8 or 10 horses disunited in body, and working without unanimity in action. It has called into employment a number of hands, and kept them moving with an alacrity quite unknown in the days of the ancient flail. All these good points it has testified; yet the result is not "enough for the money."

Now, does the defect rest with the farmer? Let us see. I first send one-half or more of those men and boys to the field to bring "more grist to the mill;" this heap of corn and chaff I have conveyed to a position above the threshing machine. I have a hopper or conductor which leads towards the drum. I set the engine to work afresh, and run the whole of this corn and chaff through in two hours or less. The first operation occupied 8 or 10 hours; this only two hours. From this proceeding I discern that the fault rests with the farmer. Judging from the time occupied by any method of proceeding, I assume that if 10 or 12 inches in length of straw were attached to the ear of corn, it would not have required more than half the time or cost one half the money which the first method demanded. But it is neither desirable nor necessary to seek to abridge the time and thereby incur expense in this matter of threshing. When threshing is required by the farmer, the engine may as well work a whole day as a half day; 20 or 30 quarters of corn would be as much as most farmers require, or desire for sale daily; consequently, if this were the sum required, what description of engine would be needed to extract this quantity (the ears of corn and a few inches of straw only being presented)? Why, a comparatively inexpensive two-horse-power engine would suffice for the threshing and other labour on 99 homesteads out of 100 throughout the country; but this is said on the supposition that certain conditions to which I shall advert will be complied with.

Let us reflect whether it be wise to thresh all this straw. Would it be wise to pass the entire Walnut tree through a machine to get the nuts off the extremities of the branches? Then is it wiser to thresh 5 feet of straw just to get 50 kernels of corn from the ear at its end? That we may have the sum total of the difficulty before our eyes to reflect upon and consider, I had better briefly sketch a picture of the whole system of straw-getting and straw-threshing, as it has been, and still is, pursued on our land. Here is my summary of the respective processes: mowing, reaping or bagging, collecting, binding, stooking or shocking, weathering, carting by snatch and catch, helter-skelter, forking, pitching, loading, binding, unloading, unforking, unpitching, stacking, thatching, unthatching, unstacking, loading, unloading, pitching, unpitching, restacking, then threshing, forking, pitching, and so on, until the straw be consumed, and laboriously recarted back to the field in another form.

Now, will any man take upon himself to say that these methods of dealing with straw and corn cannot or will not be improved upon, and the greatest part of the entire time and labour employed thereon abridged? That the processes cannot be much abridged under the present system of farming, I believe; but if any one shall assert that it will not be wonderfully, yet, by simple expedients altered and the labour lightened, when we shall come to steam farming, from such a gentleman's opinion I shall only now say I dissent, and pass on, with this brief observation; viz., that every step in farming should be taken for the express purpose of facilitating or rendering easy the approach to the next, and that in the matter of corn getting, it should be pursued for the express purpose of preventing labour and expense in corn threshing.

But I give up this point at present of getting the ears of corn only and leaving the straw behind, because I can predict, with certainty, that if we shall but adopt that method which alone is adapted to bring out the profit and power of the steam-engine in field operations, the obtaining the heads of corn and leaving the heels behind will follow as a natural consequence.

At first I did intend showing what simple conditions were requisite to be fulfilled, for the purpose of taking the ears only from a standing crop of Wheat, and how to maintain that crop in an erect position, to accomplish this desired result; but I shall defer doing so, or describing the construction of a temporary harvesting apparatus, until we shall reach its proper position in the field.

Let us at once proceed to the field; for it is evident that any future great agricultural improvement must originate there. What is it we shall have to investigate? It is a farm of 300 acres of land; the raw material to be manufactured nearly occupies 14,000,000 of square feet, its thickness being only a few inches. *C. B., Heacham, Norfolk.*

Home Correspondence.

Fresh and Fermented Dung.—There is a passage in the letter of your correspondent, "J. M.," "Philosophy of the Dunghill, No. 1," which if left unexplained would necessarily tend to confirm the agriculturist in the most prejudicial notions in regard to the treatment of his farm-yard manures. The passage is this: "It must also be borne in mind that fresh dung does not contain the same quantity of ammonia as it contains when it is in a certain stage of fermentation. 'The urine of a sow when fresh contains only 1 per cent. of ammonia, while it contains nearly 3 per cent. when it is fermented.' (Sprengel.) And when it was mixed with its own weight of water before it was fermented, it contained more than 8 per cent." The reader will naturally infer from these remarks that in the writer's opinion fermented manures are richer in that most valuable fertilizer—ammonia, than fresh manures. The fact I apprehend to be simply this: At the instant of deposit, neither solid nor liquid manure contains ammonia; so soon, however, as exposed to the atmosphere, a "change" commences, which when very active, as in warm weather, we call "fermentation;" and this "change" is the disengagement, amongst other elements, of nitrogen and its simultaneous combination with hydrogen to form the gaseous compound of nitrogen and hydrogen called "ammonia," a very volatile gas, which, if not immediately laid hold of, would pass into the atmosphere. Now water absorbs (lays hold of) a considerable quantity of this gas, and the water in urine will consequently arrest a certain amount, "nearly 3 per cent;" but that such quantity is only a fraction of the whole product in fermenting urine is apparent from the fact that the addition of its own weight of water enabled it to arrest more than 8 per cent. I apprehend this must have been the writer's meaning; if he intended to convey the idea that fermentation produced one atom of ammonia from the atmosphere, or from any source other than the nitrogen contained in the fermenting substance itself, he expressed an opinion opposed by all theory and known facts. The practical deductions I take to be these—never allow your manures to ferment if you can help it, and if you cannot bury them from time to time within the soil, where, especially if it be clayey, the whole of the fertilising elements set free by decay will be absorbed and stored up as plant food; cover such as are solid with layers of earth (and gypsum when you can get it cheap), and dilute such as are liquid with as much water as you practically can. The enormous waste of ammonia and carbonic acid (the two main articles of plant food), from the usual treatment of farm-yard manure, results partly from the notion that it is not manageable until the straw is rotted, but chiefly from the mistaken idea that it is not the right sort of stuff until it has undergone fermentation. If knowledge be the offspring of necessity, present prices will compel the abandonment of both these notions, and we shall find out that by using for litter nothing but haulm and cut straw, and of these the smallest possible quantity, the contents of our yards and boxes may from time to time be put into the soil, and thereby the necessity be obviated for preventing the destructive effects of fermentation and decay by layers of earth and gypsum. Let us always bear in mind that it is the fermentation which takes place within the soil, and that only which is turned to account, a fact we are apt to overlook or disbelieve, merely because the process is spread over some 50 acres instead of some 50 square yards. The amount of carbon which, consumed within the veins of an ox, will keep the animal warm and comfortable for the winter, consumed within the space of a few hours would feed a fire to roast him by; so the accumulated products of the farm-yard, if not previously consumed by slow degrees, as mostly happens placed in a compact heap will get into a glorious state of hot fermentation, almost warm enough to roast an ox; but if instead the cattle droppings and litter had been from time to time put into the soil, the whole amount of warmth which their combustion, that is their decay or rotting, was capable of producing would have been expended, like the carbon within the ox, in warming the soil, and the whole of the ammonia and other fertilising products of their decay been faithfully stored up as food for the ensuing crops. The series commenced by "J. M.," promises to be valuable, especially if it help, as I trust it may, to abolish the "dunghill" altogether. *P.*

Agricultural Education.—It was written by Columella, an author on rural affairs who lived about the time of the Christian era, that three requisites were necessary to the due performance of agriculture, the knowledge of doing it, the means of performing, and the will to execute the essential parts to the full and proper extent. And this observation, among many others, yet holds the entire strength of its force, and applies to the present performance of the art of agriculture, as when it was put forth by the Roman writer. It may be impossible to say which of the three requisites now mentioned is the most valuable for the specified purpose. The knowledge is very properly placed first in the list, as without it no application ever can succeed, and it must be either intuitive or acquired. Then the means must support the knowledge, or the latter will be wholly useless. And the will to make the exertion of the knowledge and the means, must be prompt and vigorous, energetic and resolute, or the two first acquisitions will resolve into inertness, and completely stagnate. The knowledge of any art is acquired by performing it, and it is advanced by the experience and observations of the actors, who enjoy the means of daily performance to afford matter of cogitation and reflection. An early education in the routine craft of any art, ineffaceably stamps the tender mind with the marks of early impressions, which become dogmas and prejudices, and are seldom or never removed. Imitations practised and persevered in from early youth become established in the habits and nature, in the gestures of the body, and in the tones of the voice, and lastly in the intellect itself. The mind is cast into a mould of dogmas, originality is cramped and destroyed, the conceptions are impressed from without, instead of rising from within, and the mind becomes a wholly passive recipient, instead of an active exponent. This lamentable effect is produced by showing to the tender mind the operations of the art in which it is to be employed, before the ground of the intellect has been occupied by any other cultivation. On the other hand, the professional art should not be entered by any votary, till the curriculum has been finished of a liberal education, and then brought to bear on the individual performances, provided with every weapon both for attack and defence, and completely armed at every point. Knowledge is never destroyed by use, but is rather augmented and perfected. Very much of the comparatively backward state of agriculture may be laid to the charge of the defective education of its practitioners. It amounts to little more than a careful inculcation of dogmas and prejudices upon the ductile mind of youth, which any subsequent portion of education is wholly unable to remove or enlighten. The current of transmission is deepened and widened by constant wear, and the settled force prevents and overwhelms any new excavation that may be attempted in its neighbourhood. Several of the chiefest improvements in agriculture have come from sources very alien to the strict profession of the art. These minds view the object in the clear light, perceive the wants, and are able to suggest the remedies. The means of performance must be ample and sufficient to dissipate any opposing forces that may offer resistance. The present outlay is not the consideration to be entertained, but the ultimate object of the undertaking, which must be carefully calculated, and safely estimated. And the will must be in attendance, to provide the necessary action, energy, and resolutions, which must not allow the purpose to be diverted, nor the undertaking to be in piecemeal performed. *J. D.*

Grass Seeds.—At page 638 you give an enumeration of the Grasses required to lay down land for permanent pasture: all very good; but really the scientific names you have given your Grasses have altogether puzzled me. I do not know one of them, having in my youth been worked hard, and not having had the advantage of schooling. I know red Clover, white Clover, Suckling, Cock's-foot, Rye-grass, hay seeds, Cock-grass, and some others. Take a peck of Rye-grass, 2 of hay seeds, 8 lbs. of red Clover, the same or more of white and Suckling; half-a-peck of Cock's-foot on the hay seeds may afford sufficient of that, and perhaps *some* of those mentioned in your list; cultivate the ground well, get a good tilth, and make it level; sow your seeds at Midsummer, *without a crop*, and turn any stock in when the seeds grow [the following year, we suppose]; do not mow before the third or fourth year; you may, and I should think *will*, have as good an herbage as with the Latin-named sorts. I have had to do with all this for near 40 years, but after sowing them could never learn their Latin names. I forgot one, the Trifolium incarnatum I think it is; we are in the dark about him, as I believe he will grow where neither of the Clovers will, produce wonderfully, and be more nutritive than any of them. *D., Woolwich.*

[It only needed that your *seeds-man* should know the Latin; but we will repeat our prescription, or rather Lawson's, with the Latin names translated: Alopecurus pratensis, or Meadow Foxtail, 1 lb.; Avena flavescens, or yellowish Oat Grass, 1 lb.; Dactylis glomerata, or Rough Cocksfoot, 2 lbs.; Festuca duriuscula, Hard Fescue, 2 lbs.; F. heterophylla, various leaved Fescue, 1 lb.; F. rubra, Creeping Fescue, 2 lbs.; Lolium italicum, Italian Rye-grass, 3 lbs.; L. perenne, Perennial do., 5 lbs.; Poa nemoralis, Wood Meadow Grass, 2 lbs.; P. pratensis, Smooth-stalked Do., 1 lb.; Medicago lupulina, Yellow Clover, 1 lb.; Trifolium pratensis perenne, Perennial Red Clover, 3 lbs.; T. repens, White Clover, 4 lbs.]

On Thorn Hedges.—Experience has now very fully established the superiority of the common Whitethorn for the purpose of forming hedges as the fences of a farm. The Sloe is very backward in growth, and the Beech wants the prickle, which forms the value of the Thorn as a warning to animals to beware of the touch. In some peculiar soils and situations the Beech thrives better than the Thorn, but is far from being so generally useful. Thorns are raised in nurseries from the

"haws" or natural seed of the plant. The young Quicksets are generally twice transplanted before the time of four years, when they are ready to be planted in the line of the intended fences. For this purpose there must be selected the strongest and healthiest plants, which must be cut to the length of 4 to 6 inches, and laid in the ground with the thickest end downwards. A straight line being placed in the direction of the intended fence, the Grass turf of the common size is raised by the spade, laid along the line in an inverted position, forming a straight fence in front, and sloped backward to the surface of the ground. On this slope the Thorn sets are placed in the number of three to 1 foot of space, with the root end almost touching the surface, and the upper end pointing to the top of the inverted turf. A quantity of earth is thrown over the Quicksets, which is taken from the front of the line of fence, forming a hollow ground in the case of dry land, and shaped into a ditch in wet grounds, afterwards filled with stones and covered with earth. The shoots from the upper end of the sets form the line of fence, and the roots proceed from the under end, spread along the surface, and find a ready and most nourishing food from the decay of the grassy herbage which constitutes the best manure that has yet been discovered. The making of new fences may be done from November to March, but best in the early winter; and so soon as the line is finished a fence must be placed on both sides, in order to effectually protect the young Quicks from depredation. The best materials are sawn rails, which in two bars or stakes can be placed before and behind the line of Quicks, and, with some little repair, will last till the fence be reared. Dead fences are to be avoided, as the contact of decaying wood is injurious to living vegetation. The shoots will protrude in the early spring, and when the weeds are strong they must be pulled away by the hand, so as to give room to the growth of the Quicks, but pared away by hoe or spade so as not to expose the tender rootlets to the scorching suns, which, in a southerly exposure of the fence, are often very injurious to the growth of the hedge. If possible, the line of Quicks should be averted from the south. Deficiencies or gaps in the regular line of the Quicksets must be promptly supplied by the insertion of fresh sets, or by pulling across the gaps the strong shoots from each side of the vacancy, and fixing them in that position by means of hooked stakes driven into the ground. From these positions vertical shoots will arise and completely fill the gap. During the second year the same treatment is employed, pulling away by hand the large weeds, so as to give room to the growth of the Thorns, and to allow the feathered spreading of the branches, which prevents the too much upward growth, and making the hedge open below. At the same time the bank of earth must not be broken by spade or hoe to admit drought to the roots of the plants. In the third year the hedge may need no mending, as the Quicks will be raised above their growth. Thorns most generally form a fence in a period of time not exceeding eight years. During that time no mangling and cutting by shears and scutchers need be done; during the first two or three years any very tall shoot may be lopped that rises too high above the general height, and also any side shoot that extends unduly to the line of fence. But beyond these two not very frequent requirements, no cutting must be done, for whenever an incision is made, a multitude of buds protrude, and form a tufted besom of shoots and branches. This a very great deformity in an upward vegetation, and exhausts the efforts of Nature in an unseemly production. The above method must be done every year till the hedge be full grown to the height of 5 or 6 feet, and the height will be regular and uniform, if the proper attention has been employed. A slight yearly scutching will keep the hedge in the proper form, merely by lopping the proud excrescences in the height or in the sides, and never touching the main body of the hedge, which is much more pleasant to behold in the moderate wildness of Nature's luxuriance than in the uniform state of rounded sameness produced by the shears of a gardener. The overquantity must be checked, and the general growth let alone. In this condition the hedge will remain till the natural period is run of its existence—till Nature is exhausted, and must be supplanted by a new plantation. In that case a new foundation must be chosen, as new sets never thrive on old grounds. This fact settles on the rotation of crops. The chief attention in raising fences of Thorn is the protection of the young state of the Quicksets against depredation. The trespass of sheep is most particularly injurious; the prickles of the Thorn catch and retain the wool, which contains some certain quality that is very hurtful to vegetation. No gaps or weak places must be allowed in any fences where cattle will search for and find a passage. A paling of two bars must secure the deficiency, and means must be employed to remedy the wants, by putting into it, as before mentioned, the shoots from each and fixing them there, while the hedge is young and pliable. This prevention is very simple and very easily effected. Hedges generally fail or become weak at the sides of gateways. It is very precautionary to make a few yards of stone wall at both sides of the entrance into a field, with the face in the line of fence, the interior of the wall filled with earth, and the Quicksets inserted between the rows of stones in three tiers upwards from the ground. This method has been seen to erect a very strong hedge close to the post of the gate. The growth of hedges should be stopped above the height of 6 feet, as great heights lodge much snow in such countries, and injure by their shade the crops on the adjoining lands. The shelter to animals that cannot be afforded by the height of 6 feet must be provided by shelter sheds erected in convenient places, and by standing in a subdivision fence. A front into each field will serve two purposes from one foundation. These sheds are equally useful against the storms of winter and the heats of summer. *J. D.*

A Smear for Sheep.—Ten Scotch pints Archangel tar, 28 lbs. butter, for 50 sheep. Melt the butter, and mix it well with the tar, adding a gallon of milk to make it work better when laid on the sheep. A good hand will smear 25 sheep in a day of 10 hours. The price of the materials vary very much, but the cost per sheep is generally estimated at 3*d.* or 3½*d.* Being the best preventive and cure for scab, smearing is only practised on mountain sheep, being also considered a considerable protection from cold and wet; though there is no doubt that smeared sheep lose condition at the time, and, as the wool, though heavier, is of much less value than white per lb., it is now much out of fashion. *For Bathing.*— One wine-glassful spirit of tar, 1 lb. soft soap, ½ lb. Tobacco leaf, for 20 sheep. Make a decoction of the Tobacco; mix this with as much water as will afford a quart to each sheep. An over dose of the spirit being dangerous, put a glass of this into each quart as required, shaking the vessel well before running it on the sheep. A man will bathe 60 sheep per day, with the assistance of a boy to pour on the mixture. Cost per sheep about 1½*d.* This kills all vermin, and is also a good cure for scab. When properly done, the wool is white. Principally practised on mountain sheep. For the last three years I have used a mixture called "Turpentine Bath," prepared by Mr. S. Brown, Haddington. Ten pounds of this mixed with 2½ gallons of warm water will bathe 20 sheep. Price per head generally about 2½*d.* It is applied in the same way as the last. I believe that butter and turpentine are the principal ingredients. It keeps the wool very white, and is perfectly safe. *Dipping.*—This is almost universally used among Lowland flocks. Nearly every country druggist professes to have a receipt of his own, which of course is the best, cheapest, and safest yet discovered. The principal ingredients in all are arsenic and soft soap, and the price per head is ½*d.* or ¼*d.* Two stout men with proper vessels, will dip 300 or 400 per day easily. These mixtures generally kill vermin well, but as far as I know, are of no use in cases of scab. Perhaps the cheapest bath is 1 lb. of arsenic for 120 sheep disolved in water, arsenic costing 6*d.* or 8*d.* per lb. It kills vermin, but does not improve the wool.—I observe that one of your correspondent's queries is regarding the cause of "fingers and toes" in Turnips. Though unasked, I have taken the liberty of directing your notice to a fact connected with this disease. Very likely you have heard it already, but as I do not remember to have seen it noticed in any agricultural work, I mention it. Wherever the soil has been ploughed wet, or poached in any way, there fingers and toes are almost sure to make their appearance in the following crop. My attention was first directed to this by a friend; and I have this autumn, what appears to me a clear proof of its truth on my own farm. Instead of Oats after Grass, from peculiar circumstances I was obliged last year to sow Turnips on part of a field. This year the whole field is under Turnips, which are remarkably good and quite free from disease, except that part of the headland which was used as a road when last year's crop was carted off, and which was much poached and cut up. On this part there is much disease, though the rest of the headland is quite free from it. I do not see any traces of it, even on the ends of drills next the diseased part. Whatever the cause of this disease may be, there can be no doubt that the only cure hitherto discovered is lime. The Turnip crop in the east of Scotland is much damaged by it this year; indeed it appears to be spreading more and more every year. *A Lammermuir Farmer.*

Agriculture has long been lame, but being well bandaged and well fed, like an old stager, she has been enabled to go on limping at a slow pace. But being now left to her own unaided efforts, it is feared by many that she will not be able to proceed, as she is sadly jostled by foreign rivals; and as the public require her to quicken her speed and keep pace with the times, it is greatly feared that she will soon drop down and die. However, as "the knowledge of the disease is half a cure," I propose that the cause of her lameness be examined into; and though only an illiterate farmer of the old school, who has never had a college education, or been honoured with the appendage of V.S. to my name, I will venture to make a few plain remarks, as to the cause of lameness, and the means likely to effect a cure, or at least to afford some relief. This I do in hopes that some V.S., or learned D.D., may investigate the dark subject, and throw the light of science upon it. Being only an illiterate blunderer, I will leave it to others to give a lucid explanation of the nature of the disease, and merely say that it appears to me to be the consequence of improper treatment and want of energy, rather than any constitutional defect. So without further apology for my inadequacy, I proceed in the thankless, and possibly offensive duty, of pointing out the errors which I and my brother practitioners have been guilty of, and the more agreeable duty of offering some hints for improvement. One of the chief errors seems to me to be the practice of following contentedly the practice of our sires, and grandsires, instead of trying to imporve upon them. Now when we look around and see the wonderful improvements and innovations in other concerns, we may fairly judge that agriculture is also capable of being advanced by similar improvements and inventions. What they may be, or to what extent they may be carried, I will not presume to say; but I see we must launch out into a new system of agriculture. We must have new and more liberal leases; for it is a folly to think that we can contend with foreign rivals while we are bound hand and foot, and loaded with a weight of game, and war-time rents; we must have freedom for the exercise of all our energies. Instead of common crops full of weeds, we must aim at uncommon ones, both in kind, quantity, and quality, without a weed to rob them of a particle of nourishment. We must not proceed with ploughing wet land, as we used to do, but we must either make it dry, or sow it down to Grass. Indeed we must not suffer even Grass land to remain undrained, if it be possible to drain it at any remunerative cost. Neither must we suffer any water, whether it be clear or enriched, to run waste, as it so commonly does; it is an invaluable element, and must be applied not only to irrigation, by which the moory mountain and the deep-drained morass may be converted, as in some few cases they have been, into most fertile meadows; but it must also be applied to every other available purpose, wherever it can be profitably applied, as it may be in most districts. We must also enlist all the other elements of nature and all the investigations of science, together with the energies of practice into our service. By such means, agriculture, aided by peace-time rents, and multiplied labour at reduced wages, may be advanced to the requirements of the times, and the speed of modern progress. If these remarks be deemed worthy of a place in the *Agricultural Gazette*, they will probably be succeeded by others on the subject. *O. F.*

Miscellaneous.

On the Nutrition of Plants. By Prof Magnus. (*Continued from p.* 605.)—In addition to these experiments, which in the advanced autumnal state of the season were necessarily interrupted, the author has also endeavoured to ascertain by experiments how far the vegetable and animal refuse, which is added to the soil to increase its fertility, effects this by the mineral matters which it contains only, or whether the organic constituents also play an essential part in it. He set out with the consideration that, if a soil upon which it is known that a particular plant is capable of becoming perfectly developed, is in a condition to bring forth the same plant of equal strength after all the organic constituents which it contained have been completely removed, this would be a proof that the latter exert no influence upon vegetation. For the purpose of determining how far this is the case, a quantity of soil, which according to the statement of the owner was adapted to the cultivation of Barley without further manuring, was heated in a covered crucible to perfect redness, and retained in this state for an hour. On cooling, the mass was of a black colour, from the carbon left on the decomposition of the organic constituents. To remove this, a portion of this black earth was heated in a current of oxygen until it contained no more combustible matter. After having been heated to redness in the oxygen, the earth was of a red colour. Some Barley was placed both in the earth which had not, and in that which had been heated to redness, and still contained carbon, as also in that which had been perfectly freed from all organic constituents, each being placed in a porcelain or glass vessel. The season of the year was somewhat advanced, for this was done in the month of June; but the plants sprang up rapidly, and became developed in all the three vessels in exactly the same manner. After a period of growth of about 10 weeks' duration, they attained a height of somewhat more than 15 inches, and all were furnished with ears, which, however, did not contain more than four perfectly-developed grains. It is evident, from this uniform development, that the small quantities of organic remains existing in the ordinary soil, when not recently manured, exert scarcely any perceptible influence upon vegetation. For the sake of comparison, some of the same Barley was simultaneously placed in some garden soil which had been manured the preceding year; it was kept in a porcelain flower-pot, which was placed near those mentioned in the preceding experiment. In this earth the vegetation was more vigorous, and the haulm much stronger than in the common soil. The plants certainly did not attain a greater height than in the former, and the ears contained only five grains; but the entire plant was more foliaceous and luxuriant. Possibly the garden soil contained the mineral ingredients required by the Barley in a more readily assimilable form than the common soil, and this was the cause of its great fertility; still the idea urges itself upon us, that the organic substances it contains cannot have remained without influence. To determine accurately if and how far this has been the case, the author endeavoured to manure the soil without bringing the manure into contact with it, hence in such a manner that this could only exert its action at a distance. For this purpose, a quantity of the common soil, which had been heated in a current of oxygen, was introduced into a glass, which was placed in a zinc vessel, and the latter hermetically closed by a tall bell-glass, eight grains of Barley having been previously placed in the soil. Beneath the bell-glass, but separated from the soil, was a quantity of freshly-manured garden soil. To be certain that the oxygen requisite for vegetation was present in sufficient

quantity, half a cubic foot of atmospheric air was drawn through the apparatus daily by means of an aspirator. But to allow of the influence of the manure being more distinctly perceived, this atmospheric air, before entering the globe, was freed from all ammonia and carbonic acid. Care was also taken to water the plants during their growth with distilled water, which was free from carbonic acid, and could be placed under the bell-glass without coming into contact with the external air. Two others, exactly like these, were placed by the side of this apparatus, which was located opposite a window situated towards the sun. One of them also contained some of the common soil which had been heated to redness in oxygen, whilst the other was furnished with the same soil which had not been heated to redness, and contained all its organic constituents. There was none of the manured garden soil in either apparatus. The Barley was placed under all the three glasses in the latter days of June, from 8 to 10 grains beneath each. Within the first 14 days no difference could be perceived in the development of the plants; but, from this time, those under the first glass differed very strikingly from the two others in which the garden mould was absent. In about three weeks the growth of the two latter was completed; the plants were between 7 and 11 inches in height: individual ones even attained a height of 17 inches, and sent forth a third or fourth leaf, but became at last white and withered; whilst, on the other hand, the plants under the first glass, which at this time were but little in advance of them, continued to grow. At the end of about eight weeks, ears began to form upon them, the number of grains in which varied from two to eight; and they had then attained a height of from 24 to 28 inches, so that they were much bent in the bell-glass. They had also sent forth numerous shoots. They altogether acquired a much stronger ap pearance than those plants which had been sown in th,e same soil, and had grown without being covered up whilst those sown under the bell-glass with the garden soil remained far behind them. The grains however were not developed, but were all sterile. It is evident, from these experiments, that manure exerts an action, even when it is by no means in contact with the soil. Theodore de Saussure made a similar experiment. H eallowed Sweet Peas to grow under a bell-glass, in the upper part of which a vessel containing manure was fixed, and also observed that the manure exerted an advantageous influence upon their growth. It might however be objected to Saussure's experiment, that he did not allow the plants to growth in earth, but in water, and only watched their development during 10 days. But during this first period of development the plant still obtains enough nourishment from its own seed-grain, so that fallacy might readily ensue. In the above-mentioned experiment, however, the result is so striking as to admit of no doubt. It might be supposed that the garden soil might have acted here merely by restoring the carbonic acid and ammonia previously removed from the air, which came into contact with the plants, and that if these had been present in the air, they would not have exerted any influence. The author regrets that the advanced autumnal season of the year did not permit the removal of this objection by comparative experiments. However, the general aspect and development of the plants under the bell-glass, where there was also garden soil, was so much stronger than in those which were developed in the same soil without being covered, that the result must be equally favourable when the air is not previously freed from these matters. But as the manure exerts so decided an action at a distance, hence, by its organic constituents only, we are compelled to admit that these constituents produce the same result in the ordinarily-used manure.—*Monatsbericht, der Akademie der Wissensch.*, zu Berlin, Feb. 1850, pp. 60-71. *Chemical Gazette.*

Calendar of Operations.

OCTOBER.

Bedfordshire Farm, *Oct.* 21.—The principal operation of the farm has lately been Wheat sowing, nearly all of which has been drilled at the rate of 6 pecks per acre. The first sown has appeared above ground, but the latter sown will require a good shower to make it braird regularly, as the land has become dry. We shall soon commence storing Mangold Wurzels, which will be succeeded by Wheat. Some of our neighbours have already stored their Mangold Wurzels, but there is reason to suppose they would have increased in weight during the past fortnight, and perhaps would have been more likely to keep better when fully matured. We have carted out the green dung from the yards at intervals, and have laid it upon the Wheat stubble, which comes in turn for Mangold Wurzel next year. It is generally agreed upon that there is a better chance for green crops when the land is manured in the autumn or winter, rather than immediately before the seed is sown in summer. The forward Turnips are nearly all consumed here now, and some of the stock has been turned to Swedes. Thirty-five cattle have been tied up to fat. They are nearly all kept upon prepared food. When first put up, they received very little corn, but the quantity is progressively increased at intervals. The fatting sheep on Turnips receive a small portion of cake along with chaff. A pound of Beans is generally reckoned equal to a pound of oil-cake, for feeding purposes; but on light Turnip soils, oil-cake consumed on them, instead of Beans, answers better for the succeeding crop. The dairy cows have a little hay at night now to assist them with the Grass, which is neither so plentiful now, nor of such quality as during summer. Store beasts are still kept entirely on their pastures; but fatting cattle cannot maintain their condition without some other assistance. Most graziers begin giving a few pounds of cake per beast, after the middle or end of September. The late Turnips have made great progress during the past month; there will be some very good crops, should the weather remain open another month. Potatoes are keeping pretty well; we know of none which have required turning as yet. *R. V.*

East Lincolnshire Farm, *Oct* 18.—We are now enjoying a most favourable season for Wheat sowing, which was this week begun, and now progresses rapidly, the land being in fine order. The drill performs from 10 to 12 acres a day—10 being about the average in this country—and we work four harrows (iron) with three horses abreast to each. Our quantity of seed per acre is 9 pecks, which sounds large in these times of thin-seeding; but, on the Wolds, which are much exposed to the weather, it is not too much: for dressing the seed we use "Down's Farmer's Friend," which was last year found to answer. With regard to Turnips, th y have with us done very well this year; though this report do s not we think apply very generally to the neighbourhood, at least as compared with last year. We have 600 lambs just gone on them, having sold 250 old ewes, buying an equal number of lambs to j in those of our own breeding. Last year the distemper was so bad in the ewes, and so many losses occurred, that this year it is perhaps safer not to breed from them, but to have the option of doing so next year with another lot. We have commenced threshing this years' crop, and the sample, though not equal to last year's, appears better than was expected; we certainly had as fine a harvest time as is remembered for some years. Sheep were rather a better trade at our October Caistor fair; the present dry weather is in their favour. *H. E.*

Notices to Correspondents.

Act of Parliament: *W J.* The act for rating the landlords of small tenements can at once be brought into operation in any parish where the inhabitants resolve upon it at a vestry meeting called for the purpose; and being once brought into operation it must continue for three years.

Address: Will Mr. Donald, C.E., be kind enough to favour us with his address.—*A Reader.* We regret to say that "D.S.E." (Mr. E. Dias Santos) died some months ago. Your letter will be returned if you will give your address.

Books: *Constant Sub.* Professor Low on Landed Property is the best book on estate management we know.

Dorking Fowls: *X X X.* These birds may have either single or double combs, and yet be "correct," *i e.*, qualified to appear at a poultry exhibition. We ourselves prefer the speckled and any dark breed of Dorkings to have a large, flat, *single* comb, as indicating purity of blood, and would admit no others into our poultry-court as stock. The white Dorkings, especially the smaller families of them, most frequently have double combs. *D.*

Mangold Wurzel Leaves: *Constant Sub.* We only know Mr. Huxtable's experience, as given at page 624, col. *c.*

Manures: *Gamma.* Salt and soot are as well sown after one another as previously mixed. We are not aware that they will materially act upon one another. Rape is allowed to stand through winter sometimes, and eaten in spring.

Poultry Clubs and Exhibitions: It is wished to collect information respecting all those which are held in Great Britain and Ireland; and secretaries and other parties connected with these meetings will confer a favour by forwarding to the Editor what their rules are, when and where their shows take place, and any other particulars which those gentlemen will have the kindness to communicate. *D.*

Salt: *Enquirer.* It is said to whiten and strengthen the straw. Apply 2 cwt. per acre over the Wheat plant in wet weather in April.

Smear for Sheep: *Pen.* See Home Correspondence.

Markets.

COVENT GARDEN, Oct. 26.

Vegetables are abundantly supplied, and Hothouse Grapes and Pine-apples are plentiful. Melting Peaches are over, but some Michaelmas ones may still be had. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent, but the former less plentifully. Filberts are dearer. Carrots and Turnips are good in quality, and so are Potatoes. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce. Cut Flowers consist of Heaths, Pelargoniums, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosissima, Japan Lilies, and Roses.

FRUITS.

Old Clover	75 80		

SMITHFIELD, Monday, Oct. 21.

The number of Beasts is again very large, and trade dull. A few choice qualities being scarce, still make a fair price. Many inferior remain unsold. The supply of Sheep is rather smaller than of late, but quite equal to the demand. Prices are a shade lower. It is d fficult to effect a clearance of the Calves, although the supply is not very great. Our foreign supply consists of 1628 Beasts, 5170 Sheep, 166 Calves, and 200 Pigs.

Per st. of 8 lbs.—	s d	s d	Per st. of 8 lbs.—	s d	s d

Beasts, 5400; Sheep and Lambs, 24,120; Calves, 213; Pigs, 500.

Friday, Oct. 25.

We have but a few English Beasts at market, and those of middling quality. Trade is exceedingly dull, and although we retain Monday's quotations, there is very little business transacted. The number of Sheep is not large; a fair supply, however, for the time of year. The demand is so small they cannot all be disposed of. The supply of Calves is moderate; there is very little improvement in the trade, and we cannot quote higher than on Monday. The foreign supply consists of 513 Beasts, 870 Sheep, 148 Calves, and 45 Pigs. There are 95 Milch Cows from the home counties.

Beasts, 1118; Sheep and Lambs, 4630; Calves, 317; Pigs, 580.

HOPS.—Friday, Oct. 25.

Messrs. Pattenden and Smith report that the market continues the same, and fine coloured Hops are scarce. Duty, 230,000*l.*

POTATOES.—Southwark, Oct. 21.

The Committee report that the arrivals though limited have been quite equal to the demand, which has been dull. The following are this day's quotations: York Regents, per ton, 70s. to 80s.; Scotch do., 60s. to 65s.; Lincolnshire Shaws, 60s. to 65s.; Rhenish whites, 60s. to 70s.

MARK LANE.

Monday, Oct. 21.—The supply of Wheat from Essex, Kent, and Suffolk this morning was small, which enabled factors to realise the rates of this day se'nnight. The arrivals of foreign continuing to be considerable, buyers generally refrained from purchasing, being unable to succeed at lower prices.—Barley, except the finest malting, is a heavy sale.—No alteration in Beans.—Peas must be written 1s. per qr. cheaper.—Last week's prices for Oats are tolerably maintained, except for lower kinds of Irish, which are 6d. per qr. cheaper.

Per Imperial Quarter.	s. s.		s. s.

Friday, Oct. 25.—This morning's market was moderately attended, and the arrivals of Wheat from abroad having been good, millers were careless of buying at our extreme quotations. English may be considered the same as on Monday. —Spring corn of all kinds is a heavy retail sale at late rates. Galatz Maize has realised 31s. The value of Flour is unaltered, but secondary descriptions of sour are more difficult of disposal.

Liverpool, Friday, Oct. 18.—In place of the short arrivals this week we had a good general display of samples from granary at our market to-day, and upon a rather limited number of buyers somewhat less animation was observable in most departments of the trade. In English, Irish, or foreign Wheat therefore the operations were upon a moderate scale only; sellers, however, remained firm, and in partial cases realised upon superior qualities 1d. per 70 lbs. over the current rates of Tuesday. Barley, Malt, Beans, and Peas, continue unaltered. Although in Oats no change was apparent, a very choice parcel of Limerick obtained 1d. per 45 lbs. Oatmeal firm, and prime new the turn dearer. Indian Corn, commanding a steady demand, maintained late rates.——Tuesday, Oct. 22.—There was but a moderate attendance of country buyers at our Corn Exchange this morning, and trade by no means active; however, some descriptions were 1d. per 70 lbs. higher than on Tuesday last. Malting Barley was 1s. per qr. cheaper, but in grinding samples, or in Malt, no change was apparent. Beans, though not taken freely, were held steadily at former rates. Peas dull and rather cheaper. Present prices: Wheat, English red, per 70 lbs., 5s. 9d. to 6s. 3d.; white, 6s. 0d. to 6s. 6d. Barley, Scotch and Irish, per 60 lbs., 2s. 10d. to 3s. 2d. Malt, English, per qr. pale, 49s. to 55s. Oats, English and Scotch, per 45 lbs., 2s. 9d. to 3s. 0d. Beans, English, per qr., 28s. to 32s. Peas, do. do., 31s. to 33s.

GLASS FOR CONSERVATORIES, GREENHOUSES, FRAMES, &c.

JAMES PHILLIPS AND Co., 116, Bishopsgate-street Without, are supplying SHEET GLASS, packed in 100 feet boxes, at the following *Reduced Prices*. A reduction on 1000 feet.

HALLIMAN'S REGISTERED FRUIT PROTECTORS, from 6*d.* to 1*s.* each.
MILK PANS, from 2*s.* to 6*s.* each.
PROPAGATING AND BEE GLASSES, from 2*d.* each.
WASP TRAPS, 3*s.* 6*d.* per dozen.
LACTOMETERS, for trying the quality of Milk, 7*s.* 6*d.* each.
STANDS, for Pianofortes, 1*s.* each.
Glass Shades for Ornaments, Parian Marble, Wax and Alabaster Ornaments. Lamp Shades and Glasses, Patent and British Plate. Ornamental and Stained Glass; and every article in the Trade.
N.B. All packages charged, but full price allowed if returned free of expense.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½ an inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

A LARGE STOCK OF SILVERED PLATE GLASS for Mirrors, also Crown and Sheet Glass in Crates and Squares for Dwelling and Hothouse Glazing, at WILLIAM PERKS Junior, and Co.'s, Glass and Lead Warehouse, 52, Dale-end, Birmingham.
DEPOT FOR HARTLEY'S PATENT ROUGH PLATE GLASS

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 2½*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.
See the *Gardeners' Chronicle* first Saturday in each month.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.
THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.
The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of Strong Grape Vines in pots from eyes, all the best sorts.
Plans, Models, and Estimates of Horticultural Buildings, also Catalogues of Plants, Vines Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

HAMMERSMITH—TO HORTICULTURISTS & FLORISTS.

TO BE LET, on Lease, with immediate possession, a well stocked and very eligible Garden Ground, consisting of upwards of 2 acres, enclosed with high walls abutting on the high road at Hammersmith, with a convenient Cottage and Shop, Greenhouses, Forcing Frames, &c.; well adapted in every respect for an active Market Gardener and Florist.—Further particulars, and to view, apply to Mr. GOMME, Auctioneer and Surveyor, Hammersmith.

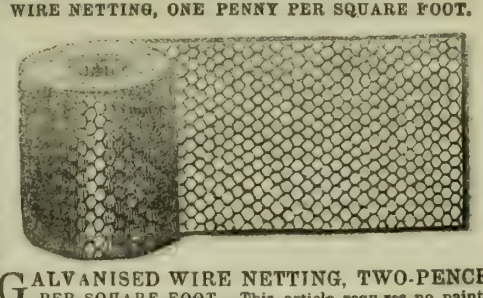
THOMAS MILLINGTON. GLASS, COLOUR, AND PAINT MANUFACTURER, 87, BISHOPSGATE-STREET WITHOUT LONDON.

DIXON'S NEW (REGISTERED) VENTILATOR—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents, JAMES PHILLIPS and Co., 116, Bishopsgate-street, Without.
Dixon v. *Bessell.*—*Alderman Wilson said, "It was a very clever invention, and he thought Mr. Dixon ought at least to have seven years' protection instead of three," and fined the defendant* 60*l.*, *and* 10*l.*, *costs, for an infringement of the Registered design.*—*Oct.* 1, 1850.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25*s.* upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.
*** Roofing and Plain Slate work, of all descriptions, at low prices.

FRY AND ALSOP'S IMPROVED SULPHURATOR and FUMIGATOR.—A Portable Machine for Diffusing Sulphur amongst Plants affected with Mildew, such as Vines, Wall-trees, Heaths, Peas, &c.
This Machine has been improved by F. and A. making it less complicated and more perfect in effective, and they flatter themselves that nothing can be brought into notice to compete with it for usefulness and simplicity of construction.
Extract.—"No garden can be complete in its arrangements without it."—*Gardener's Magazine of Botany and Florists' Guide*, Oct 1850.
Orders sent for the above to FRY and ALSOP, Lee, Kent, will meet with prompt attention.
Manufactured also for agricultural purposes.—Oct. 26.



GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch „ strong „ ...	9 „	6½ „
2-inch „ extra strong „ ...	12 „	9 „
1½-inch „ light „ ...	8 „	6 „
1½-inch „ strong „ ...	10 „	8 „
1½-inch „ extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.* per yard.	30 inches wide	7½*d.* per yard.
18 „ „	4½*d.* „	36 „ „	9*d.* „
24 „ „	6*d.* „	48 „ „	1*s.* „

Galvanised do., 1*d.* per foot extra.
Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

DR. S. NEWINGTON'S IMPLEMENTS OF AGRICULTURE.—These Implements have been invented to introduce an improved system of cultivation, and a more scientific method of depositing the seed. A Prospectus and Lecture on the different methods may be obtained (gratis) by applying to Messrs. DUFAUR and Co., Agricultural Depôt, 21, Red Lion-square, London.

PARTNERSHIP.—An eligible opportunity offers for a young Man who thoroughly understands the growth of plants for the London markets, and who can command from 300*l.* to 400*l*; or, such a person as described, who would prefer to advance a sum of money on security and good interest, without the risk of Partnership, and have the management of the business, at a salary, will be liberally treated with. References of the highest respectability can be given.—Further particulars may be obtained on application to Mr. FIELD, 4, Coleman-street, London.

THE HIPPOPOTAMUS, presented to the Zoological Society by the Viceroy of Egypt, is exhibited daily at their Gardens in the Regent's-park, from 11 to 4 o'clock. Visitors desirous of seeing the animal in the water are recommended to go early. Admission 1*s.*; on Mondays, 6*d.*

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The Ales of this season's brewings are now ready for delivery. For further information apply to SAMUEL ALLSOPP and SONS, Burton-on-Trent; or their Stores at 61, King William-street, City; Cook-street, Liverpool; High-street, Birmingham; and The Exchange, Manchester.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the Teeth! Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed Teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designated unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. Rowlands' Odonto, or Pearl Dentrifice, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*

ROWLAND'S ODONTO

Is a white powder compounded of the choicest and most *recherché* ingredients of the oriental herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Price 2*s.* 9*d.* per box.—Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

IMPORTANT TO SEEDSMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS have received instructions from the Assignees of Mr. Charles Bunyard (a bankrupt), to offer to public competition, by Auction, on the premises (Nash and Hicks's Warehouse, Horsleydown), on THURSDAY, October 31, at 11 o'clock, the whole of the valuable SEEDS and IMPLEMENTS IN TRADE, viz., Sacks, Bags, Weights, Scales, and Measures; a capital Winnowing Machine, Nests of Seed Drawers &c..—May be viewed, and Catalogues had of Wm. Whitmore, Esq., Official Assignee, Basinghall-street; of Messrs. Morten Thomas and Holland, Solicitors, Mincing-lane, London; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BRENTFORD, MIDDLESEX.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET-GARDENERS AND PUBLIC COMPANIES, ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are directed by the Executors of the late Mr. J. Ronalds, to offer to public competition by Auction, on the premises (the Twolands Nurseries, Brentford End), on MONDAY, Oct. 28, and two following days, without any reserve, the whole of the VALUABLE NURSERY STOCK, riding over 30 acres, which is particularly worthy the attention of Noblemen and Gentlemen laying out their grounds, as well as the Trade, for its excellence; and comprises several thousand Fruit Trees of the leading and approved varieties, a large quantity of Forest Trees, Ornamental and Deciduous Shrubs, with a rich assortment of Evergreens.—May be viewed, and Catalogues had, at 1s. each (returnable to purchasers), on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HORNSEY ROAD.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. W. J. Pamplin to submit to public competition by Auction, on the premises, Paradise Nursery, Hornsey-road, Islington, on MONDAY, November 18th, and following day, a part of the valuable NURSERY STOCK, comprising fine Evergreens, &c.; also choice Greenhouse Plants, consisting of Double Camellias, beautifully set with bloom buds, 18 inches to 6 feet, Azalea indica, Epacris, Ericas of all the leading varieties, Chrysanthemums, &c.—May be viewed prior to the sale; Catalogues had (6d. each, returnable to purchasers) on the premises; of the principal Seedsmen in London; of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The Nursery to be Let, with immediate possession. The remaining Stock may be taken at valuation, if required.

NEW AND RARE ORCHIDS FROM NEW GRANADA.

MR. J. C. STEVENS respectfully begs to notify, that Mr. Linden's Orchids HAVING NOW ARRIVED, he has fixed the Sale of them to take place at his Great Room, 38, King-street, Covent-garden, on MONDAY next, 28th inst., at 1 o'clock precisely,—38, King-street, Covent-garden, Oct. 26.

JAVA ORCHIDS—JUST RECEIVED FROM MESSRS. ROLLISSON'S COLLECTOR.

MR. J. C. STEVENS begs to announce for Sale, by Auction, at his Great Room, 38 King-street, Covent Garden, on TUESDAY, October 29, at 12 for 1 o'clock, an Importation of most RARE AND VALUABLE ORCHIDS from Java, just arrived in Wardian cases, in perfect health; it consists of upwards of 60 fine specimen plants of the beautiful and rare Saccolabium Blumei majus, fine plants of the true Vanda suavis (collected in flower, to ensure their being the correct species), several plants of a new and handsome flowering Aerides (very fragrant, intermediate between virens and quinquevulnerum), fine specimen plants of Vanda tricolor (the best variety, also collected in flower), and a few plants of the new and beautiful Spathoglottis plicata of Blume, red and white species.—May be viewed on the morning of Sale, and Catalogues had of Mr. J. C. Stevens, 38, King-street, Covent Garden, London.

1000 CAMELLIAS, WELL SET WITH BLOOM, FROM MR. AUG. VAN GEERT, OF GHENT.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, November 1st, at 12 o'clock, 1000 CAMELLIAS, well set with bloom buds, from 1½ to 4 feet, consisting of many Double Whites and other favourite sorts, and a few plants of the fine Camellia Mathotiana, the largest and best red known.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. Stevens, 38, King-street, Covent-garden, London.

CHERTSEY, SURREY.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. WATERER will sell by Auction, on MONDAY, October 28, and following day, at 11 o'clock, by order of the Proprietor, at Brox, about two miles from the town of Chertsey, and one mile from the Addlestone Station, a valuable NURSERY STOCK, comprising 75,000 Fruit, Forest, and other Trees, Evergreen and other Shrubs, including Spruce and Larch Firs, Birch, Horse Chestnut, Turkey Oak and Holly, Common, Wood, and Portugal Laurels, Arbutus, Laurestinus and Laburnums, Standard, Dwarf, and Climbing Roses, Honeysuckles, Irish Ivy, Daphnes, Clematis and Aucubas, Pears, Peaches, Apricots, and Nectarines, Plum, Pear, and other Stocks, Rhododendrons, Azaleas, Kalmias, and other American Plants, Ornamental and other Flowering Shrubs, 800,000 Bedded and Seedling Quick, and other Stock, the whole of which are in a safe moving condition.— May be viewed one week previous to the sale, by applying to Mr. George Gray, Brox; and Catalogues had on the premises, and of Mr. Waterer, Auctioneer, Land and Timber Surveyor, Chertsey, Surrey.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

SUNNINGDALE AMERICAN NURSERY, near Sunninghill, Berks, two miles from Virginia Water, two miles from Sunninghill Wells, and half a mile from Shrub's Hill.

MR. WATERER will Sell by Auction, on MONDAY, November 4, 1850, and following days, at 11 for 12 o'clock precisely, part of the extensive and valuable NURSERY STOCK of Mr. James Walker; consisting of 25,000 blooming Rhododendrons; Kalmias and Azaleas for Forcing, and many large ornamental Plants; a large quantity of Choice Evergreens and Flowering Shrubs, Dwarf Roses, and Honeysuckles, Standard and Dwarf-trained Apples, Pears, Cherries, Plums, Peaches, Apricots, and Nectarines, of the most approved sorts, Common and Portugal Laurels of all sizes, Birch, Ash, and Oak, Purple and Common Beech, Spruce, Larch, Scotch and Balm of Gilead Firs, of all sizes, a large quantity of Quick, from 3 to 5 years old, and a great variety of other Nursery Stock, well worth the attention of Nurserymen and others, about planting, being in a safe moving condition. N.B.—The above is the produce of Seven Acres, and will be sold without reserve, as the Lease expires at Midsummer, 1851.—May be viewed one week previous to the Sale, and Catalogues had on the premises; of Mr. Chablwood, Seedsman, Covent-garden; and of Mr. Waterer, Auctioneer, Chertsey, Surrey, who will forward them on application, by post, enclosing six postage-stamps.

POOLE NURSERY, 1 mile from Poole, on the Parkstone-road.

IMPORTANT SALE OF NURSERY STOCK.

MR. NICHOLL has received instructions to sell by Auction, on the ground, the whole of the Stock of Evergreens, Ornamental and Flowering Shrubs, Fruit and Forest Trees, without the least reserve, on THURSDAY, November 7th, 1850. The Stock of Shrubs comprises Laurels, Arbor-vitæ, Red Cedar, Evergreen and Scarlet Oaks, Berberis, Hemlock, Spruce, Azaleas, Ericas, Box, Roses, Dwarf and Standard, &c. The Forest Trees are about 20,000 Oaks, 3 to 6 feet high, 10,000 Scotch, 20,000 Spruce, 500,000 four-year old strong Quick Thorns, Elms, Beech, Birch, Acacia, and Hornbeams; a fine collection of Pinus, &c. The Fruit Trees are Filbert, Apple, Pear, Plum, and Cherry. The above will be found particularly worthy the attention of gentlemen planting; as the whole stock is beautifully grown, with a large mass of fibrous roots, and the soil of the Poole Nursery being remarkably light and poor, the trees are sure to thrive luxuriantly when removed. Sale to commence at 12 for 1 o'clock precisely. As it is intended if possible to sell the whole in one day, punctuality is respectfully solicited. Catalogues sent on application to the Auctioneer, Poole, upon enclosing two penny stamps for the payment of postage.

IMPORTANT AND EXTENSIVE SALE OF NURSERY PLANTS, ON ABOUT SIX ACRES.

MR. T. BAXTER is directed to sell by Auction, on TUESDAY, October 29th, and following day, at Bromley-hill Nursery, on the London side of Bromley, Kent, the very superior and well-rooted Stock of Plants, including about 4000 Common and Portugal Laurels, 4600 Green and Worked Hollies, Variegated and Green Box, Arbor-vitæs, Yews, Cedars, Arbutus, 4000 Spruce, Scotch, and other Firs, and Forest Trees of every description, 20,000 fine Quick, Mulberries, trained Peaches, Nectarines, and Apricots; valuable and well-budded Camellias, Rhododendrons, and other Flowering Shrubs and Plants. N.B. A lengthened time will be given to clear off the Lots.—May be viewed seven days preceding the sale, and Catalogues had at the Auction Mart, London, at the place of sale. &c.

ABSOLUTE SALE OF AMERICAN PLANTS, EVERGREENS, AND OTHER NURSERY STOCK.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton (one mile from Hyde-park Corner), on TUESDAY, October 29, and following day, at 12 o'clock, 2000 Scarlet and other Rhododendrons, Azaleas, Andromeda, Ledum, &c.; 1000 Standard, Dwarf, and Pillar Roses, Standard and Dwarf-trained Fruit-trees; 1000 Victoria and other Rhubarb Roots, Fig-trees, Strong Grape Vines; about 5000 Evergreens, 3000 Ornamental Trees, Deciduous Shrubs, &c.—May be viewed prior to Sale, and Catalogues had at the principal Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, London.

IMPORTANT SALE OF CAMELLIAS, LILIUMS, RHODODENDRONS, &c., FROM AN EXTENSIVE GROWER AT GHENT.

MR. HASLAM will sell as above, on FRIDAY, November 1st, at the Auction Mart. Also, at the same time, about 250 Standard Roses, from the South Essex Nurseries.

FARMS TO LET, WITH IMMEDIATE POSSESSION.

MR. HURLEY, Farm Agent and Valuer, begs to urge Farmers and others requiring either Large or Small FARMS, to make known their wants immediately to him, as he has upwards of FIFTY FARMS, Arable and Meadow, of the first description, from Sixty to Six Hundred Acres, adapted to every kind of Farming, and rents to meet the times, in Surrey, Cambs, Sussex, Essex, Berks, Bucks, Kent, and Middlesex.—All applications (accompanied by two stamps) addressed to the Auctioneer, 62, Nelson-square, London, will meet instant attention.—Proprietors having Farms to Let are solicited to insert the same in Mr. H.'s Register.

The FOLLOWING DESIRABLE FARMS are submitted in addition to Mr. Hurley's last Published List, to which he begs to refer attention, namely—

A VERY EXCELLENT FARM known as "Rookwood Hall," situate in Essex, comprising TWO HUNDRED and EIGHTY ACRES of sound Turnip, Wheat, and Barley Land, Forty Meadow, with capital Residence and Outbuildings.—Rent and tithes moderate.
